The Nation.

NEW YORK, THURSDAY, JANUARY 7, 1897.

The Week.

THE restoration of the reciprocity treaties is positively announced as a part of the McKinley programme. Like some other parts, this serenely disregards the fact that changed times command changed policies. It also forgets that the very corner-stone of the reciprocity treaties was free sugar. Without it the first treaties—those with Brazil and Spain (for Cuba)—would never have been written, and but for these the others would not have followed. But it is now agreed on all hands that the new tariff bill is to tax sugar. The only question is how much, and this is a matter for nice adjustment between the Sugar Trust, the Louisiana cane-growers, and the makers, or would-be makers, of beet sugar all over the country. With sugar taxed, what is there left to base reciprocity upon? Free hides, some one may say. But hides may not continue free, in the first place, and, in the second, they had no coercive power in the hands of President Harrison. He threatened to tax Argentine hides if no reciprocity treaty was forthcoming, but thought better of it; and the tax he actually laid on Venezuelan hides had no result except to restrict our supply. Free sugar is, in short, absolutely essential to reciprocity. The former we are not to have, but the latter we are certain to get. You ask how, and the only answer you get is, that this is going to be the greatest administration ever known for harmonizing fire and water and achieving impossibilities.

The tariff hearings have at least succeeded in disposing of one false pretence, and that is that the new bill must be had for the sake of revenue. Who of the men heard by the committee have thought or cared or spoken about revenue—except the revenue that is to flow into their own pockets? There has been some fatuous talk, it is true, about the larger receipts of the Government under the higher rates of duty, provided importations kept up to their present figure. But as, in the same breath, the aim is avowed of shutting out all importations, and the claim made that by a little more protection the domestic manufacturer will be able to supply the home market entirely, these allusions to revenue are transparent humbug. The fact has been made clear that the protectionists have simply found a new form of dishonesty on which to base their impudent demands. They now want special favors and law-made profits only for the sake of making good the Government deficit. If the deficient revenues were really the thing to be cured, a bill of three lines would do it. As it is, no one can guess within $20,000,000 what the new tariff will produce. Behind all rises the question, Are the national revenues really deficient? The Treasury report for December shows a surplus of $2,000,000 for the month. This looks like a dastardly attempt to discredit in advance the new prohibitory protectionist tariff for revenue only.

Senator Sherman delivers himself of some senile maunderings about taking the tariff "out of politics." It is not a political question at all, he gravely argues, but a business question. If you doubt it, just look at the men who appear at the tariff hearings. Are there any politicians among them? Are they not all business men? Yes, they are business men who have bought and paid for protection, and who go to Washington to demand it from the politicians whom they have put in power for that very purpose. Chairman Dingley feebly begs them to take half they ask and be satisfied, but the spirit of blind and greedy protectionism has evidently broken loose as never before in this country. The committee itself is clearly aghast at the impudence and extravagance of some of the haughty demands made upon it. Taking the tariff out of politics! As long as more money can be made by buying Congressmen than by buying wool or cotton and manufacturing it, as long as there is greater profit in selling votes on the tariff than in selling merchandise, protection will stay in politics. It will stay there, too, as it always has been in the past, a corrupting power, the responsible cause of Populism and Bryanism; in the end, as destructive to free government as it is to free competition.

If anything were needed to show the utter folly of supposing a tariff can be framed in a way to "stay put," it would be furnished by the hearing on the cotton schedules. The cotton schedules of the Wilson bill now in effect were publicly accepted by the manufacturers as perfectly satisfactory. Their spokesman in the Senate, Senator Aldrich, declared those schedules the most "scientific" ever drawn, and said that the New England manufacturers had nothing to complain of in that particular. Yet they were present in force at Washington on Tuesday week to claim their share of the national largess with the rest of the public mendicants. Protection which was ample and thorough two years ago is now good for nothing. So it always has been. Let the manufacturers write their own rates in a new bill, and in two years' time they would be just as angrily clamorous for better protection. Yet simple-minded old Senator Sherman is going to take the tariff out of politics!

A correspondent writes to us in a querulous tone to say that we have made a "misstatement" in saying that chlorate of potash has always been on the free list of the tariff. We have to acknowledge that this was an error. What we should have said was that chlorate of potash was put on the free list by the McKinley tariff, and that it was dutiable previously at the rate of 3 cents per pound. We assume that McKinley was a good authority on this subject. Probably he reasoned that an article which entered largely into other manufacturing industries, and was not produced in this country, ought to be on the free list on protectionist grounds. We can remember a time when the doctrine prevailed extensively that the object of protection was to build up manufactures. It has since suffered a change into something rich and strange. The prevailing notion now is a distribution of the national income by a log-rolling bill, according to the number of votes that can be mustered for this, that, and the other interest. On this basis we see very little reason to expect a duty on chlorate of potash in the forthcoming bill, although there is just as good a claim for it as for a duty on chromate of potash, or on raw wool, or on anything which is taxed for private rather than for public revenue.

The sticking-place of any new tariff bill is certain to be the Senate. This the protectionist manipulators well know, and they are already busy with plans to "fix" the Senate. One evidence of their scheming is seen in North Carolina, where they are favoring the reëlection of Senator Pritchard. He has been an out-and-out silver man, and is even now supported by some Populists on the ground that he is "as good a silver man as there is in the country." But he appears to have promised Mr. Hanna not to insist upon a free-silver rider to a tariff bill, and that, of course, is enough. Once get the tariff through and the currency may lie a-bleeding, for all the Republican managers care. They mean to "fix" some more silver Senators as they have fixed Pritchard. They will make them promises to do something for silver, which they hope afterwards to find some convenient way of lying out of, or will help them to get a re-election, or in some way coax or bribe them into voting for a tariff bill without silver. Watchful Wharton Barker has several columns of "alarums and excursions" on this very subject in his *American* of last week. He exhorts the Silver Republicans to be unyielding —"Let There Be No Surrender!" Let them give no credit to the gay deceivers

of the protectionist cause. If they stand their ground firmly, they can defy the whole host, and make it again "free silver or no protection." All told, the new tariff bill promises to be a great success at least in developing legislative scandals and the prosperity of senatorial intriguers. But that is a venerable infant industry which always fares best at the hands of a tariff bill.

The House committee on banking and currency is going to have some "hearings" of its own, beginning on January 6. It will listen to the advocates of different bills for reforming the currency. Chairman Walker and some of the most influential members of the committee are thoroughly convinced of the need of doing something. Doubtless they are also convinced, as is the country, that nothing will be done by the present Congress. Still, their invitation to business men to come on and explain their views is to be commended. It may help to keep people mindful that there was an election turning on the currency issue only two months ago. Even a few gentlemen going to Washington to ask for a measure in the public interest, would furnish a pleasing contrast to the hordes who are besieging the ways and means committee for private favors. But the Indianapolis convention a week hence is likely to be of more importance to the question of currency reform than any hearings at Washington.

More cheer for silver came from Canton last week. Mr. McKinley had requested Senator Wolcott to undertake an "unofficial mission" to Europe. He is to "sound" European bimetallists, and see what can be done about another international conference. Major McKinley is said to be indignant at the "disquieting reports" put out in the Silver States that he would do nothing for silver. He wants it to be understood that he means to live squarely up to the platform. That precious document mentioned international bimetallism in a furtive and sheepish way, and thereafter it immediately dropped out of sight in the canvass except as a laughing-stock. But McKinley is fond of laughing-stocks of that kind, and is determined to associate himself with this one as closely as possible. Senator Wolcott explained that his trip became "prematurely public," which he "deplored." He had hoped that it would be "kept quiet." Secrecy, nocturnal meetings, cipher dispatches, are an essential part of the new international bimetallism. Nor would the Senator give the names of the eminent English bimetallists whom he goes to sound. There is no shyer bird than your eminent bimetallist, and he might refuse to stand and be sounded if public notice were drawn to him. Finally, announced the Colorado Senator, "I have, for my own part, little hope of any international agreement that will carry out our views." In other words, the whole thing is simply one more belated attempt to sprinkle international salt on the tail of the Silver Republican vote.

Sending agents abroad to sound foreign governments on the subject of bimetallism is simply to prolong the doubt as to what is the real meaning of the word dollar. It does not help the matter any to bring into doubt also the meaning of the pound sterling, the franc, and the mark. In a supposable case all four of them might be brought into discredit, but that would mean more disturbance rather than less. It would give us partners in confusion, but would not lessen our own share of it. Even if we take a more hopeful view of it, if we suppose that another international conference would succeed where three have failed miserably, much time must elapse before any result whatever can be reached. The period of gestation would carry us beyond the next congressional elections, if not to the next Presidential election. But, as has been said, the advance agent of prosperity becomes the full agent within two months' time, and he will then be held responsible for his title. What effect will his failure have on the elections two years hence?

Mr. Bryan points a finger of scorn at the successive bank failures. What is the "advance agent of prosperity" doing, he inquires, to let such things occur? We do not see that Mr. McKinley has any answer—certainly he will have none after March 4. For every broken bank, every passed dividend, every closed mill he will be, after that date, personally responsible. If Bryan had been elected, he would have been, he admits, responsible. But what a humiliating position for a free people to have got itself into! All eyes are turned to Washington, whence help must come or we perish. Once we kept our eyes on our business and said to Government, "Hands off!" Now it must be governmental hands on all the time, or we are lost. The big Chicago bank failure, which caused several others, was due to most scandalous banking methods, bad loans to sons-in-law of the President, loading up with speculative stock, and all that. Reckless loans on real estate explain a bank failure in Minneapolis. Yet we wring our hands and cry to Heaven and McKinley, and say there must be something rotten in the government if such terrible things can happen.

The Senators and Representatives who have been home during the recess of Congress have had a chance to find out how little sympathy with Jingoism there really is among the people. The Chandlers and Camerons and Morgans will have no evidence to offer that the people are with them in their proposal to go to war with Spain over Cuba. So far as the press indicates the sentiment of the public, the country stands in support of the President by an overwhelming majority. Bill Chandler had a chance during the holidays to read in the Manchester *American*, one of the most prominent Republican newspapers in his State, the declaration that, while nine-tenths of the voters of the United States believe that Grover Cleveland is "a wrong-headed, opinionated, bigoted, obstinate man, whose election to the Presidency four years ago was little less than a national calamity," yet "their opinion is or will be that his recent course in dealing with the complications growing out of the Cuban insurrection is vastly more to the credit and material well-being of the country than is that of the fire-eating Senators and members of Congress who demand the instantaneous obliteration of Spain from the map of nations." So, too, Senator Frye of Maine was notified by the Portland *Press* that, if he is in favor of interference, the great majority of Maine people are not with him. We are not aware that a single journal of character and standing in the whole country supports the policy championed by the Senate committee on foreign relations.

The Republican machine in Illinois is loath to abandon the idea of giving the United States senatorship to a "boodle Alderman" of Chicago, and the decent element in the party does not expect to make it back down without a hard struggle. The scheme was cooked up months ago. The Governor-elect, the Illinois member of the Republican national committee, the Chicago Congressman who is the most of a boss in the delegation, and the other members of the "combine," both in Chicago and elsewhere in the State, treated the office as absolutely belonging to them when they decided last summer how various places in the public service should be apportioned, and assigned it to Alderman Madden. They treat the mayoralty of Chicago, which will fall vacant next April, in the same way now. But the very impudence of this Illinois machine may prove its destruction. Even Tweed in his palmiest days would not have thought of giving the United States senatorship from New York, if its disposition had been in his hands, to a Tammany Alderman. He would at least have made a pretence to decency by picking out a respectable figurehead, like John T. Hoffman, who had not been openly connected with notorious steals. It marks the downward tendency of party machines that in both New York and Illinois the "organization" of the party which has always prided itself upon its high character, is now committed to the support for the senatorship of men who are known to levy upon corporations for money of which they make no account. The only differ-

ence between them is that the Illinois machine is rather the more shameless of the two. But there is a great difference in the reception of the machine programme in New York and in Illinois. Here almost everybody "deprecates personalities," is opposed to telling the truth about Platt for fear of "flinging mud," and is afraid to be "anti-Platt." There, prominent Republicans are ready to declare themselves anti-Madden, to make "intensely personal" speeches, to cite date and place of Madden's dishonesty.

Some light is cast upon the modern interpretation of "legitimate expenditures" in politics by the revelations that are being made in the Pennsylvania senatorial contest. It recently came out that a fortnight before the November election the chairman of the Republican State committee, "by request of Senator Quay," enclosed sums of $250 and $500 to various candidates for the Legislature "to help defray your campaign expenses." Frank Willing Leach, who has had a political experience of fifteen years as the lieutenant of Senator Quay, says that the campaign for the chairmanship of the Republican State committee in 1895 cost a sum estimated by Quay himself at $200,000. Leach expended a considerable portion of this amount, but he certifies that all the funds disbursed by him were spent in aiding the election of delegates friendly to Mr. Quay, "and it was a perfectly proper expenditure." This last, it must be remembered, was simply a factional fight in the Republican party for control of its State convention, and yet an expert testifies that the expenditure of $200,000 by the winning side is "perfectly proper"!

The name of Seth Low is signed to the draft of the new charter which contains the bi-partisan police provision, but it is not possible that he has given it his approval. The plea which the committee who drafted the charter makes in defence of the bi-partisan principle is that it is necessary because the Bureau of Elections is included in the Police Department. This, as we have pointed out already, is the old machine dodge of refusing to make the Bureau of Elections separate, in order that this very excuse might be advanced. Mr. Low condemned both the bi-partisan principle and this excuse for it in his speech before the Mayor, on May 1, 1895, when, in opposing the Platt bi-partisan bill of that year, he said:

> "The great objection to the bill is in its fundamental defects. It is not altogether what it does, but what it does not do. It has not taken the Bureau of Elections out of the hands of the Police Department, and has not separated them. This is the fundamental defect of the bill."

A month earlier, in opposing the same bill at Albany, Mr. Low said that the separation of the Bureau of Elections from the Police Department had worked well in Brooklyn and should be adopted in New York. At the hearing before the Mayor, Mr. Low read extracts from the Lexow investigation, showing the appalling corruption in the police force, in consequence of the politicians' grip on the department, and said:

> "In view of these, I should like to ask whether any one believes that bi-partisanship will take partisanship out of the department. We cannot believe it. Are we to say that we have discovered the panacea for all municipal evils in bi-partisanship? Mr. Mayor, let us return to the platform of the fathers of the Republic. They put aside the idea of bi-partisanship and adopted the idea of individual responsibility. They put one man at the head of the Treasury, one man at the head of the State, and one man at the head of the Post-office Department. We have had good results from that policy. Surely, under these ideas, we should have greater results than from any bi-partisan bill."

The daily sessions of our Police Board constitute the strongest possible argument against the bi-partisan provision of the proposed Greater New York charter. It is impossible for the honest and capable members of the board to attend to the business of the department, because the presence of one tricky spoils politician among them makes it so. He compels them, by his open and secret manœuvres in the interest of the Platt machine, to spend the greater part of their time in bickering with him in the only partially successful task of exposing his schemes and cornering him in his falsehoods. He has had no other function in the board, since he entered it as the "representative of the Jimmy O'Brien Democracy," than to impede the public business, block all efforts for the thorough reform of the force, and give provocation for incessant wrangling. He is the very incarnation of the bi-partisan idea, and he works as other incarnations of it who preceded him—Johny McClave, Jimmy Martin, Mike Kerwin, Charlie Murray, and Johnny Sheehan—worked for so many years, to prevent the Police Department from becoming a thoroughly honest and efficient body. If Parker were out of the Police Board to day, and an honest, capable man were in his place, or if Mr. Roosevelt or Mr. Andrews were sole head, there would be no further bickerings, the members of the force would realize that the last stronghold of the old demoralizing "pull" system had been carried, and the task of reform could be accomplished without bickering and without delay.

The Southern press gives more space than ever before to the advantages which their section offers to settlers. It would be hard to exaggerate the claims that may be truthfully made as to the climate, the fertility of the soil, the opportunities for developing material resources of various sorts. But there is one drawback which will make nine out of ten Northern people who think of making the change at first hesitate and finally decide against it. It is the appalling record of crime, as given in the very newspapers that appeal for settlers. Take Georgia, for example, "the Empire State of the South," as it likes to be called. Ex-Gov. Northen is diligently engaged in setting forth its advantages as a place for homes, but the Savannah *News* is forced to confess that "the criminal record for Christmas week in Georgia is very, very bad." The reports published in the *News* on Christmas and the two following days show no less than twenty homicides, many of them being cold-blooded murders, and the great majority growing out of the drinking of whiskey, while there were also numerous bloody fights. In the expressive language of the *News*, "whiskey-drinking went along with pistol-toting, and when the liquor had got in its work, pistols were whipped out and lives sacrificed," with the result that "it was a sad Christmas to hundreds of Georgians, because of whiskey and pistols."

The renewal of the charter of the Bank of France, now pending before the French Chamber, has given rise to some curious ideas about banking, comparable to those of our expertest Populist financiers. The great thing in the minds of the Deputies is to get a bank that will cheerfully discount "agricultural paper." They know that the existing Bank of France has a horrid and heartless way of asking for collateral, and they fear that the managers under the new charter will go on in the same bad fashion unless the law compels them to be more considerate of unsecured notes. Accordingly they proposed to amend the charter in such a way as to compel the Bank to discount nine months' agricultural bills with two signatures. But the committee voted this down, eleven to five, after the Minister of Finance had said the charter would not be accepted by the Bank on those terms. Still, something must be done for agricultural paper. The Premier, M. Méline, the French McKinley, and as paternal and benevolent as he, insists upon some kind of bank for the farmers. His idea is to have a Central Bank, especially for agriculture, intermediary between the Bank of France and the farmers. Excellent, said the Deputies; put that in the charter and compel the Bank of France to pay out of its profits the losses from the discount of agricultural bills. It was taken for granted on all sides that there would be losses. If the bills had to be met when due, what would be the advantage of a Government bank to discount them? But M. Méline did not quite want to put it in the charter. It might frighten the stockholders. If the Chamber would first extend the charter and get that safely out of the way, he would pledge himself to bring in a separate bill for a nice, grandmotherly sort of bank for the farmers. There the matter hung at last accounts.

SENATORS OF NEW YORK.

THERE seems to be no doubt that the remarkable hold which Platt has upon the Republican party of this State will be shaken off when an opportune time for doing so shall arrive. The trouble is to find a really opportune time. Several disappointments have been experienced in the search for one. It was thought in December and January, a year ago, that precisely this kind of time had arrived. Cornelius Bliss, Elihu Root, John Sabine Smith, and twenty-two other Republicans of unimpeachable standing collected evidence to show that Platt had got possession of the party machinery through an enrolment which was thoroughly rotten with fraud and forgery. They proved their case, and were going ahead to repudiate Platt and put him outside what Sheehan calls the "pale of the organization." Just as they had become thoroughly indignant and irresistibly belligerent, somebody said to them: "See here, are you quite sure that this is not an inopportune time for your movement? Platt is a bad man, and this enrolment is undoubtedly rotten, but is this the time to make a row about such things?" When Elihu Root heard this he paused and allowed his mind to dwell upon the time. Cornelius Bliss and John Sabine Smith did the same.

What was the result? To their unspeakable chagrin, they found that the time *was* inopportune. Mr. Root at once stated the case to the public. The movement must be held back till after the Presidential election, for nothing could be more inopportune than party dissension on the eve of a great struggle for the salvation of the nation. As soon as that crisis was passed, Mr. Platt and his rotten organization would get their deserts. Well, the crisis passed, and when it was over, the discovery was made that, during the anxiety about the country's honor, Mr. Platt had been busying himself with collecting a Legislature which would make him a United States Senator. Mr. Choate was put forward as a man more worthy of Republican support for the place. It was very difficult to say that you preferred Choate to Platt without saying why; but the minute you began to say why, you saw that the whole movement was inopportune. How so? Because we were on the eve of a Republican national administration, and any real antagonism to Platt at this time would arouse partisan feeling, create party discord, and disturb that harmony without which the new President could not hope to grapple successfully with the great problems which confronted him. When the Republican Club was asked to favor Choate, it declined to allow the subject to be discussed, or to have any unpleasant allusions made to Platt, because to do so now was so clearly inopportune. Cornelius Bliss, John Sabine Smith, and Elihu Root would convince you within two seconds of this if you had any doubt.

But we did not need to rely on our local experts in inopportunity. A good Platt man went post-haste to Canton, and talked with Major McKinley and Mr. Hanna about it. They were both of the same mind. Major McKinley deprecated anything which should disturb the existing harmony in New York, or deprive his administration of the full benefit of it. Mr. Hanna held that, since Mr. Platt was certain to be elected, the opposition to him was clearly inopportune. Why, it might result in preventing the passage of a new tariff bill unless called off. When these opinions reached this city, all the anti-Platt Republicans who had been looking for a good excuse for postponing their movement again, threw up their hands, saying as loyal Republicans they could not do anything to endanger McKinley's administration. So Platt will be elected to the Senate with very little opposition except from confirmed Mugwumps, who are never so happy as when they are thoroughly inopportune. They fairly dote on inopportunity, and think that the best time in which to fight a political rascal is when he is engaged most openly in his deviltry.

When shall we have the blessed sight of the opportune time in which to fight Platt? There can be no hope for it this winter, for the McKinley administration will not begin till March, and its problems will remain unsolved for a long time afterwards, so that any disturbance of party harmony will be inopportune. Everything that goes on at Albany in the Platt Legislature, including the "jamming through" of a new charter for Greater New York, will have to be accepted meekly for this reason. Is there any hope for next fall? We fear not. It will be necessary then to save the city from Tammany; and a fight with Platt, on the eve of election, will be most inopportune. After that our next chance will come in the winter of 1897 and 1898, but you see we shall then be on the eve of a new State election and of a congressional election, and harmony will be as essential as ever. In fact, there seems to be no time when you can fight a corrupt boss without disturbing the harmony of the party, and there is never a disturbance of harmony which is so entirely opportune as to please all the conservative minds of the party.

There appears to be no way out of it except for Republicans who do not enjoy Platt's government to become perfectly reckless and say that, after all, common honesty is of more importance than party harmony, and that it is better to be inopportune than to acquiesce in the destruction of popular government. Signs of so violent an upheaval in party ethics as this would be are not plentiful just now, but there is no telling what the future may bring forth. In addition to the all-powerful dread of being inopportune, there is the scarcely less potent fear that too reckless devotion to mere honesty in politics may lead to classification with Mugwumps, and they are such a very lonesome and powerless lot, you know. They never get any offices, and the candidates whom they advocate are seldom elected. What could be more forlorn, for example, than the position in which Mr. Choate is to be left when the present contest closes? He will get very few votes in the Legislature, while Platt will have a great majority, and Choate will be pointed to as a warning to all ambitious men against the deadly support of Mugwumps.

GOVERNORS OF NEW YORK.

MR. MORTON closed his term of office on Friday with a well-written review of the political affairs of the State during his term of office. He went over the legislation in which he has concurred, and gave each measure its due proportion of importance. He might, however, have said more about the working of the civil-service amendment to the Constitution, because this has occupied more of the attention of political men than anything else. In fact, the government may be said to turn on this. Every measure at Albany, like the Raines bill, is considered rather with reference to its effect in creating offices or controlling modes of appointment than to any other. Gov. Morton might, therefore, without impropriety have discussed more fully the consequences it is likely to have as regards the institutions of the State. But we confess we do not see how he could do so with freedom after appointing to a high office in Brooklyn one of the oldest and most notorious friends of the spoils system and of political corruption generally. The amendment to the Constitution was really intended to make men like Worth harmless, and the Governor might very well have told us something about the extent to which this intent will, in his opinion, be carried out.

When Gov. Morton took office in 1895, there was a very general expectation that he might, in virtue of his high character and his financial soundness, become the Republican candidate for the Presidency. He failed in this, mainly owing to too great reliance on the support of the New York machine, which, as has often been illustrated, really is much less powerful and important outside the State than in it. It has not succeeded in imposing a single candidate on the convention except Van Buren, and the machine in 1836 was a very different thing from what it is now. Its composition was better and its aims were higher. Almost ever since, New York delegations have arrived in the conventions discredited by faction fights and charges of corruption. Cleveland revealed to the world in 1892 the real weakness of our State machinery on both sides, by getting the nomination in spite of the

hostility of the delegation of his own State. There was warning in this as to the temper of the public mind, which was more than confirmed by the nomination of both McKinley and Bryan. They were both the product of something deeper and more important than machinery. We had hopes in the beginning that Mr. Morton would take this to heart and "go to the country," to use the ancient Saxon phrase, on his own merits, over Platt's head, as the champion of sound currency, of a reformed civil service, and of purity and efficiency in office—no "armor but his honest thought, and simple truth his highest skill." Our opinion was that, had he chosen to put himself at the head of the reform movement which was so powerful in 1894, and availed himself of the conspicuity which New York always gives to its high officials, as a Governor who stood for the country more than for party, not only would he have given a completely new turn to the politics of this State, both in city and country, but he would have imposed himself on the convention without Platt, in spite of Platt, as the man to win under. But he chose the other part. He appointed Aldridge when he came in, and has appointed Worth as he goes out, and has generally taken instructions (in spite of some good acts of rebellion) from the boss throughout his administration; and the recording angel drops a tear on the story as he writes it down.

Of Mr. Black, the incoming Governor, we say but little, for we know next to nothing. His nomination and Bryan's, both being completely unknown men, are conspicuous instances of the breakdown of our nominating system. Of neither of them did the general public know anything until one great party chose one of them for the Presidency because he invented a taking metaphor, and another great party chose the other for a governorship because he had successfully prosecuted a murderer. The result is curiously paradoxical, a sort of realization of the fable, for two mountains have brought forth two mice. All that has been said about Mr. Black hitherto is mere rumor. We shall this time next year be able to tell what kind of Governor he is. He has begun in the worst possible manner by reappointing to an office Jake Worth, probably one of the chief political rascals in the State. Maybe he will appoint more of the same; maybe he will not—all is a mystery. His expression in his inaugural address that "no intolerant clamor or irresponsible assault will force or prevent a single executive act," was generally held by the politicians to mean that he would certainly appoint Lou Payn. Possibly it did; but it may have been only a bit of rhetoric, intended to give notice that he will be firm as a rock. It can hardly have been intended as plain prose, because of course no man yields confessedly to "intolerant clamor or irresponsible assault." Mr. Black's English has probably been neglected. It may be, too, that, like the Philadelphia machine, which nominated two men just out of the penitentiary as police magistrates and elected them as "a dose for the high-toners," he is merely giving notice to the wretched public that their palaver about honesty and efficiency in office will not disturb him.

THE TREATMENT OF ENVY.

The crisis through which this country has lately passed has afforded great opportunities to moralists of various schools. They have generally agreed as to the gravity of the case and the alarming character of the symptoms, however divergent their opinions have been concerning the nature of the malady and the appropriate remedies. It is quite natural that the clergy should take a prominent part in these diagnoses and prognostications. The near prospect of a social cataclysm mightily arouses prophetic ardor by making it once more possible to disturb the complacent and alarm the supine. Hopeful suggestions are well enough in a way; but really to move men to action there is nothing like arousing their fears.

In prophecy of this kind, however, the clergy possess no natural monopoly. There is nothing in the education of a clergyman, nothing in the "atmosphere" which surrounds him, to give him any exceptional power of foreseeing the stages of social development. No one questions that the animus of the unsuccessful party at the recent election was to a great extent envy. The conditions were such as to unite the envious; but it is a mistake to suppose, as some clergymen appear to do, that men's hearts have not been heretofore equally prone to evil passions. "That feeling of hostility which is the only abasement of the poor in the presence of the rich"—to repeat what Hawthorne said fifty years ago—has been recognized by all observers, from Aristotle to De Tocqueville, as peculiarly manifest in a democracy. Those clerical observers who are now proclaiming that they know the hearts of the poor, and that they find them filled with hatred of the rich, doubtless report their observations correctly, but they have discovered only a well-known phenomenon. The managers of our sensational press think it pays to snap and snarl at the rich, and are, of course, utterly unbridled in the licentiousness of their speech; but if they were altogether silenced, envy would not be suppressed, and perhaps it is less venomous for not being bottled up.

For dealing with the envious there is what may be called the rational method, whereof we saw many admirable illustrations during the recent campaign. Poor people may be convinced that their interests are bound up in the general prosperity; that the property of the rich cannot be confiscated without such a disturbance of industry as will throw vast numbers of workmen out of employment. Accumulated wealth is, after all, the source of wages, and, if the springs are dried up, the streams will cease to flow. We cannot throw down the superstructure of property without undermining the foundations; and however detestable the possessors of great fortunes may be, the gratification of our hatred may seem too costly if it involves our own ruin. The part of Samson is a great part. "The People" may exult in the thought that their hands are on the pillars that uphold the social structure, and that if they bow themselves they can bring down the whole temple. But envy is a selfish and calculating passion, and however agreeable the destruction of those whom we envy may seem, the prospect of being hoist with our own petard is so unpleasant as to cause most of us to shrink from the indiscriminate use of dynamite.

What we have called the rational method, however, is only to a limited extent available to the clergy. It may fall within their province, as instructors in general, to show their people that certain acts are contrary to their interests; but no religious sanction attends such calm and utilitarian counsels as these. A man may be a better citizen for reasoning that as repudiation of debts would cause hard times wherein he would suffer, therefore he will have none of it. He may be in some ways a better man for going through this process of reasoning; but he has attained no such pitch of perfection as to make him a good Christian. He may abstain from overt acts of malignity, but his heart may be just as full of envy as ever, and he may be only nursing hatred until the time comes when he can injure others without injuring himself.

It is a painful observation, but we cannot help saying that some of the clergy have adopted what may fairly be termed the irrational method of dealing with envy. They seem to think that the people who are envied are to blame for arousing the evil passions of their neighbors, and that the envious are quite justified in their indulgence in hatred. The only advice they have to offer is that the envious must be propitiated; advice which they offer in a way that irresistibly suggests Lear's verse—

> There was an Old Man who said: "How
> Shall I flee from this horrible Cow?
> I will sit on this stile and continue to smile,
> Which may soften the heart of that Cow."

No doubt if the envied would turn over to the envious all those possessions which are coveted, the problem might be temporarily solved. But if any one imagines that condescension and beneficence are going to disarm hostility, he understands neither the present situation nor human nature. The poor whose envy is dangerous will take such condescension and beneficence at their true value, as the evidences of terror, the promptings of cowardice, the proofs that the rich have no just claim to their fortunes. As was

shown in the last campaign, they will take their employers' money and wear the McKinley buttons; but they will vote for Bryan just the same. What they want is to pull their betters down and get up themselves, and while they will snatch whatever the fears of the wealthy prompt them to disgorge, it will only whet and not satiate their appetites. Even if we concede that the envious may be propitiated by humbling ourselves before them, we do not understand how clergymen can consider that there is any merit in sacrifices extorted under such conditions and made from such motives.

For our own part, we are satisfied that the old way of regarding envy was the true one. It is, and always will be, a mean and odious passion, deserving nothing but condemnation and only thriving on sympathy. As the irascible man needs to keep a constant guard on his temper, as the lustful man must incessantly repress his appetites, so he that is tempted to envy should fight against it with all his strength. The passion is an evil one; twice cursed, injuring him that is envied and him that envies. It is no more to be tolerated in the poor than in the rich; whatever their grievances they are not to be cured in that way. Once let a poor man give himself up to envy, and his lot becomes hopeless. Every one's hand is instinctively raised against him, and he repels the kindly aid that is sure to be offered to all those who show a kindly disposition. No genuine social reform can come from pandering to envy; its malignant spirit will corrupt every measure devised for the purpose of appeasing it. The abuses of our government are due to the bad character of the rulers chosen by the people; if they complain of these abuses, let them insist on having men of stern integrity to make their laws. Doubtless those clergymen who are encouraging the poor in their envy have good motives. They hope that in some way good may come out of evil; that a better condition of affairs will result from placating the envious. But they would be wiser if they saw that true reforms can come only from reformed men; that if men will first seek righteousness, a better social system shall be added unto them.

THE ECONOMIC ASSOCIATION AT BALTIMORE.

BALTIMORE, January 1, 1897.

The ninth annual meeting of the American Economic Association was held at the Johns Hopkins University in this city on December 28 31. In many respects the meeting was one of the most interesting and noteworthy in the history of the Association. Attendance was large and distinguished. Harvard, Yale, Columbia, Cornell, the University of Pennsylvania, University of Michigan, University of Wisconsin, University of Minnesota, University of Illinois, University of Nebraska, Princeton, Brown, Amherst, Vanderbilt, Syracuse, Haverford, Smith, Hamilton, Bryn Mawr, Wellesley, the Massachusetts Institute of Technology, and the College of the City of New York were among the institutions represented. The academic contingent naturally predominated; but interest and piquancy were added by the presence and frequent participation in discussion of such well-known non-professorial economists as Mr. Horace White, Hon. Charles S. Fairchild, Mr. Sheppard Homans, of New York; Mr. Thomas G. Shearman of Brooklyn; Mr. Stuart Wood of Philadelphia; Mr. Lester F. Ward, Mr. W. F. Willoughby, Mr. G. K. Holmes of Washington.

The programme of the meeting was an essential departure from the ordinary practice of the Association, and in line with the tentative procedure of last year's meeting at Indianapolis. Of the six regular sessions held, but two were devoted to the presentation and criticism of formal papers. The introductory session was given to the president's address, and each of the remaining three to the discussion of a particular economic question of current interest, led by designated persons and thereafter open to general argument. The formulated theses of the first speaker appeared on the programme and shaped the course of subsequent discussion.

The association was pleasantly welcomed at the opening session on Monday evening (December 28), by President Gilman of Johns Hopkins University. The annual address of the President of the Association, Prof. Henry C. Adams of the University of Michigan, was an acute and suggestive paper on "The Relation of Economics to Jurisprudence." Its fundamental proposition was that much of the confusion in economic theory and of the discord in industrial life is due to inadequate expression by formal law of fundamental industrial rights. This maladjustment has been caused by the extraordinary industrial development of the past one hundred years. The individualism of the eighteenth century fails to express the moral necessities of the present industrial order. Further, the principle of responsibility, which is the cornerstone of English jurisprudence, is incapable of industrial application under existing industrial conditions. The remarkable contributions of President Adams's address were involved in the consideration of the essentials of industrial liberty, and of the proposition that there is no industrial liberty without industrial property. He assented to the latter assertion, but of the nature and quality of this property right the economist could not as yet, he thought, speak with precision. In all likelihood, it will rest upon a more perfect analysis of the productive process than the one which leads to the assertion that a man's possessions are the measure of what he or his ancestors added to the world's stock of wealth. It will recognize distinctly and formally the fact of social and associated production. Its clarification will take place through the evolution of collective bargaining and the formal labor contract. Finally, a characteristic of this evolution will be that increased stress will be laid upon the theory of industrial agency.

The discussion on Tuesday morning of the question, "Is there a Distinct Agricultural Question?" from which much had been expected, was perhaps the one disappointing feature of the meeting. This was due in large part to the enforced absence of all the proposed leaders of the discussion, namely, Prof. Bailey of Cornell University, Hon. George T. Powell, Director of Agricultural Institutes of Pennsylvania, and Hon. L. G. Powers of the Minnesota Bureau of Labor Statistics. It had also been hoped that Mr. Morton, Secretary of Agriculture, or Assistant Secretary Dabney might be present, but neither was able to attend.

The theses formulated by Prof. Bailey were to the effect that the transition from small to large holdings, the common system of unvaried cropping, the efflux of young people from the farms, are characteristics of a period of general industrial change, and that it is reasonable to anticipate, through the continued activities of new social, educational, and industrial forces, a radical improvement in the status of the agriculturist in the not remote future. The tenor of subsequent discussion was less optimistic. Substantial agreement was expressed that the extent of territory in the United States, and the corresponding variety of conditions, render impossible any broad generalization as to the actual status of the farmer. Yet the existence was freely admitted of acute agricultural distress in many sections of the country, remediable only by the slow process of economic readjustment. This was well set forth by Prof. E. R. A. Seligman of Columbia University, who emphasized the fact that this country is no longer the granary of the world. Depression of agricultural interests, he thought, must continue until our population has again caught up with subsistence, and we have possibly become, like England, a wheat-importing instead of a wheat-exporting nation.

The most important discussions of the meeting occurred on Wednesday. The topic of the morning session was: "What is the Present Direction of Acquisitive Investments, and what are the Economic Effects of such Investments?" Hon. Charles S. Fairchild, ex-Secretary of the Treasury, led the discussion, and called attention to the advantages and disadvantages of the savings bank as a place of such investments, and to the changes in savings-banks deposits since 1860. The system obviously makes saving easy, and accumulates capital for the benefit of the community. The word "deposits," and not "investments," in savings banks, however, indicates a serious evil of the system. In times of financial disturbance there is wont to be an unwarranted and premature withdrawal from the savings banks of deposited funds. Securities come on the market when it is not ready to take them, and thus funds, meritoriously accumulated and of considerable benefit to the community, become at such times a menace to all business interests. Mr. Fairchild raised the question whether it might not be better for deposits to be invested directly instead of through the savings banks, and discussed building and loan associations, life insurance, real-estate mortgages, stocks and securities of business enterprises as forms of such investments.

The discussion which followed dwelt on the need in this country of institutions in which persons of moderate means, depositing periodically certain sums, could find a safe investment, and yet could not withdraw at will. Productive enterprises organized in corporate form might reasonably be expected to satisfy this need; but the results of corporate mismanagement have been so disastrous to the small investor as to cause widespread hostility to such forms of investment, and to render savings banks almost the only "havens for frightened investors and shipwrecked entrepreneurs."

The afternoon discussion, on "The Duty of the Government toward the Investor," formed a natural sequel to the morning topic. Professor Arthur T. Hadley of Yale Univer-

sity led the discussion, and advanced the general proposition that the application to modern corporate business of legal traditions established in days of smaller industrial operations results in practices which, while not technically fraudulent, have an effect on the investor analogous to that of commercial frauds. Some of these practices can be prevented by statutes providing for publicity of accounts. Others can be prevented by the prohibition of directors' contracts. Neither of these interferences in behalf of the investor, Professor Hadley contended, would be likely to do any harm at all proportionate to the good to be expected from it. Still other evils can be prevented by imposing on the promoters of new enterprises a special liability, civil and criminal, for the correctness of their representations; and in this case also the balance of good over evil which might be expected from a change, though less clear than in the two former instances, seems sufficient to warrant a movement in its favor.

Doubt was expressed in the ensuing discussion as to the wisdom of governmental inspection, in that it served as a false guarantee to the investor, and in general undertook to do what could not possibly be accomplished. As to the expediency of greater clearness and publicity of accounts, legal procedure against fictitious capitalization, and liability of officers for the correctness of reports, there was a general agreement.

Currency and banking, which easily constituted the subjects of prime interest at last year's meeting, engaged very much less attention at the present gathering. Prof. W. A. Scott of the University of Wisconsin subjected "The Quantity Theory of Money" to a careful and thoroughgoing analysis. Prof. David Kinley of the University of Illinois described the results of his continued investigations into "The Use of Credit Instruments in Business," the details of which are embodied in the forthcoming report of the Comptroller of the Currency. From returns made by 5,530 banking establishments in the United States on July 1, 1896, it appears that 68 per cent. of retail and 95 per cent. of wholesale deposits are made in credit instruments. Allowance for various factors would reduce the percentage in retail trade to between 55 and 60, and leave that of wholesale trade unchanged. The results of this investigation were criticised in respect to retail trade, on the grounds that by no means adequate allowance had been made for (1) the smaller use of credit instruments in sections of the country where no banks exist; (2) the considerable proportion of trade receipts in currency, used for current expenditures and not appearing in the volume of bank deposits.

The remaining formal papers were presented at the sessions of Tuesday afternoon and Thursday morning. Prof. Roland P. Falkner of the University of Pennsylvania criticised the statistics of crime returned by the eleventh census, and urged that instead of enumerating the prison population, we should enumerate all the prisoners received in the United States in the census year. As chairman of the Committee on the Organization of the Census, appointed at the last annual meeting, Prof. Falkner also reported that the committee, acting jointly with a committee of the American Statistical Association, had addressed a memorial to Congress urging the establishment of a permanent census office. Prof. J. R. Commons of Syracuse University discussed the advantages of day labor over contract systems in municipal works. Mr. H. T. Newcomb of the United States Department of Agriculture reviewed the results of the Interstate Commerce act in the past decade, and Prof. Carl C. Plehn of the University of California described the operation of the general property tax in California.

A pleasant feature of the meeting was the social appointments which engaged the Association in the intervals between scientific sessions. An informal "smoker" in the rooms of the Department of History, Economics, and Politics on Monday night; luncheon in McCoy Hall on Tuesday and Wednesday; a reception by Mr. Theodore Marburg, chairman of the local committee, on Tuesday night; and a formal dinner by the Merchants' and Manufacturers' Association on Wednesday night held the visiting members well together, and thus prevented what experience has shown to be a disadvantage of holding a scientific meeting in a large city.

The reports of officers and chairmen of committees showed the affairs of the Association to be in a very satisfactory condition. Prof. J. W. Jenks of Cornell University, who has filled the office of Secretary of the Association with marked acceptance for a term of years, was unable, through pressure of other duties, to accept reëlection, and was succeeded by Prof. W. F. Willcox of Cornell. The remaining officers of the Association were reelected without change. The selection of the place of the next annual meeting was referred as usual to the Executive Committee. In view of the fact that the American Historical Association and the Political Science Association of the Central States will meet in Cleveland in 1897, it is likely that the American Economic Association will select the same city. H.

CARTHAGE.

CARTHAGE, November 15, 1896.

OF all the famous sites of antiquity, there is, perhaps, none which displays to the curious traveller so few visible traces of its former wealth and greatness as does Carthage. Few, too, are there which have, in proportion to that wealth and greatness, yielded to recent exploration so little in the way of works of art or of inscriptions. The reasons of this are not far to seek. The city was twice utterly destroyed and laid waste in a systematic way; and such buildings, even the foundations of buildings, as escaped destruction have been ransacked to furnish columns, pieces of marble, and even stones for the erection not only of mosques, palaces, forts, but also of the houses of the peasantry. When Carthage ceased to be a city, she became a quarry, and, in the process of quarrying, even those things which were of little use for building elsewhere were broken or removed. What has survived is of great interest, and more may still be recovered, but the quantity will probably remain small when compared with what many a place in Italy or France of far less note has yielded.

Although, however, there is not at Carthage a single column standing erect to bear witness to a temple or a church—not even a wall rising four feet above the surface—the site is one of surpassing interest. It does not, indeed, present, what nearly all the other ancient seats of Phœnician or Greek settlement do, either a sheltered natural haven or a strong natural fortress. This is the traveller's first surprise. There is no land-locked harbor, like that of Piræus, or Byzantium, or Barcelona, or Tarentum, or like the Old Port at Marseilles. There is no craggy height, fitted for defence, like the Acropolis of Athens or of Taormina. The ports, of which the remains can still be seen, appear to have been artificial; and the hill of the citadel is neither very high nor very steep. Yet the situation has some remarkable features.

At the extremity of a peninsula stretching eight or ten miles into the Mediterranean, and connected with the mainland by a flat isthmus, across which the sea must once have flowed, there is a ridge of hills, forming a sort of semicircle some four miles long, with its convex turned toward the sea, and rising at its highest point to about 400 feet. The sea under the hills is deep, and sheltered from the northwest, the quarter whence most high winds come, while toward the land the neck of the peninsula, even now only some three miles wide, and two thousand five hundred years ago probably much narrower, makes the defence of a settlement upon the hills comparatively easy. It was at the southern extremity of this line of hills that the Tyrian founders of Carthage planted their settlement, and the last eminence or hummock toward the south became their citadel or Bozrah (for "Bozrah" seems to be the true Phœnician form of the word which the Greek and Roman authors have written Byrsa). This hummock rises about 200 feet above the sea, from which its base is a quarter of a mile distant. It is steep towards the sea on the east and the south, while sloping more gently towards the west. On it and around its base the city arose. The ports were excavated beneath it to the southeast, and were easily made large enough (the ground being partly alluvial and the rock soft) to contain a large fleet and many merchant vessels. Thus the position was both convenient and strong. The citadel defended the ports, and while the citadel was surrounded by a wall of its own, the city, stretching along the line of eminences to the north, had also an enclosing wall of its own, and thus gave a double protection to the citadel on the sides (north and west) where the acclivities were gentle.

So much is clear. The ports are still visible, though so decidedly smaller than the descriptions of ancient writers imply that some antiquaries suppose there existed another port, enclosed by moles projecting into the sea, which has since vanished. The remains of the amphitheatre have been unearthed in the lower ground at the western base of the hill. And as to the Bozrah itself, on whose summit stood in Punic times the temple of the great god Eshmun, and where probably stood also the residence of the Roman proconsul, afterward the palace of the Vandal kings, there is no question. But almost everything else is uncertain. Various spots have been suggested as the sites of the temples and churches and other public edifices mentioned by the ancient writers, but no data have yet been discovered sufficient to fix them. Even the direction of the walls and the extent of ground covered by the city are matters of controversy, so far as the evidence of the diggings goes. The ground area included in the compass of the city proper would appear to have been small (hardly more than a square mile) compared with its population, which is said to have at one time reached 700,000 or even a million. But probably there were large suburbs; and as the bulk of the population consisted of slaves, many might well be crowded into a small space.

Like the excavations at Hissarlik (which is

now generally admitted to be the site of Troy), the diggings at Carthage have disclosed four different periods of culture, represented by four sets of objects of art. Lowest of all are the sepulchres of the early Punic times, with a few rude pieces of pottery placed in them. Some of them recall the objects found at Mycenæ; and the shape of the tombs, rectangular holes cut in the soft rock, with two large stones set up at an angle over the top, has a Mycenæan touch, though nothing we now see at Carthage can be quite as old as the remains discovered at Mycenæ. Next above come the buildings and tombs and fragments of work of more recent Punic times, ending with the traces of burning which no doubt belong to the conflagration that ended the great siege of B C. 146, when Scipio Africanus the Younger took and destroyed the city. Next come the Roman remains of the pagan period, and last of all those which date from Christian times, between the beginning of the fourth and the end of the seventh century. The tombs we now see belong chiefly to the two first periods, and they are so numerous and cover so much ground, not only under the débris of the city proper, but in the adjoining country to the north and northwest, as to make Carthage seem in a double sense a city of the dead. There are inscriptions, Punic and Latin, from all periods, but neither so numerous nor so valuable as might have been expected. Those of Punic times are all, or nearly all, either sepulcbral or *ex-voto;* and are couched so nearly in the same words—a short prayer to the Lady Tanit or to Baal Ammon—that they do not greatly enlarge our knowledge of the Phœnician language. The fragments of pot tery and of statuary which belong to the Punic period, most of which are displayed in the little museum that the French Fathers have established on the spot, give a low impression of Carthaginian art and taste. They are monotonous in conception and rude in execution. Though the Carthaginians despoiled the Greek cities of Sicily of the beautiful works of art which adorned these cities, the possession of admirable models had apparently done little to improve their own artistic sense or to make more finished the execution of their workmen. Their art as well as their history stamps them as a hard, practical people, with little grace or refinement. They had horrible deities, vehement passions, a character and habits prone to cruelty and oppression. But they were a great race, bold, forcible, tenacious. When one thinks of the dominion which this one city, with perhaps only some thirty thousand men of Punic blood, won for herself and maintained for centuries over the shores and islands of the middle and western Mediterranean, one feels that on the political side they were no unworthy foes and rivals of the Greeks and of Rome herself.

The work of digging and exploring still goes on, but though it will probably clear up many topographical problems that are still obscure, there is little reason to think it will bring to light works of great artistic or historical value. The ground is covered for miles around the Bozrah with mounds and heaps of rubbish, and strewn with small fragments of pottery and Roman mortar. These shapeless and mutilated evidences of departed greatness are in their way quite as impressive as the shattered temples in the less utterly obliterated cities of Sicily. Their effect on the traveller's mind is hardly lessened by the erections with which the tasteless zeal of French ecclesiastics has recently defaced the summit of the citadel hill. Under Louis Philippe, the French Government placed upon the Bozrah a chapel to mark the spot where St. Louis is supposed to have expired, in his unfortunate crusade of A. D. 1270. It is a choice example of "carpenter's Gothic." More recently the late Cardinal Lavigerie, who rejoiced exceedingly in his title of Archbishop of Carthage and Primate of Africa, built a large cathedral on the same hilltop, a cathedral which is now the most conspicuous object in every view of the city site from a distance. It is a heavy structure, in which an unsuccessful effort has been made to combine Moorish features with twelfth-century Romanesque. I have never seen a more deplorable monument of misdirected energy, for Lavigerie was an able and restlessly active mind, giving to his plan for the recreation of Carthage as a great commercial and ecclesiastical centre what time he could spare from his projects for the expulsion of the English from Uganda and the extension of French influence over the whole of North Africa. Fortunately the French Government refused to sacrifice an existing Tunis for a possible future Carthage. The ports are not likely to be now reëxcavated and furnished with quays, for a canal has been dug through the shallow lagoon of Tunis from Goletta, long its seaport, to Tunis itself. The site of Carthage is likely to be left to those churches and convents which now crown it, and which, ill-placed as they are, do not really obscure its natural features or seriously impair the sense of desolation and solitude which it stamps upon the traveller's mind.

I have left to the last the most striking feature of this famous spot—its extraordinary natural beauty. As the position is strong for defence, with the sea environing it, as it is admirable for maritime empire, lying in the middle of the Mediterranean, with Sicily and Sardinia close at hand, half-way from the motherland of Tyre to the outermost Phœnician settlements on the edge of the ocean, so it rivals in the nobility of its landscape Constantinople or Corinth or Gibraltar. The hill of Bozrah is not lofty, but it rises so steeply from the sea, and commands so unbroken a prospect in every direction, except northeast (where it is overtopped by Sidi Bon Said, another eminence of the same chain of hills two miles away), that the view seems boundless over both land and sea. To the east there is the vast expanse of the Mediterranean, broken twenty-five miles off by the rocky isle of Zembra. To the southeast a long line of hills rises over the ample bosom of the Gulf of Tunis, running far out to the Fair Promontory, as the ancients called it, now Cape Bon. To the northwest, beyond the flat lands which the sea once covered, rise the gentler ridges where stand the lovely ruins of Utica, the elder sister of Carthage, the spot where Cato's death left Julius Cæsar master of all the Roman world except Spain. To the south and southwest three magnificent mountain groups successively arrest the eye and carry it far into the interior of Africa. Nearest, with its foot washed by the sea, is the double-peaked summit of Bon Kornein, the mountain of the two-horned Baal (Saturnus Baalcaranensis, as the Romans called him), where the ruins of his temple have been recently discovered. Further to the south is Jebel Resas, the Lead Mountain, among whose gorges the mercenary troops that revolted from Carthage and brought her almost to destruction after the First Punic War, were hemmed in and destroyed by famine and the sword. Furthest of all, and highest, is the magnificent pinnacle of Zaghwan, "Mons Zeugitanus," whence the Zeugitanian province took its name. In this peak rise the copious springs which, led by an aqueduct more than eighty miles in length, supplied Carthage with the purest water, and from its craggy top the view extends far away to the south, over plains once rich, but now mostly waste and desolate, almost to the verge of the Sahara. Immediately beneath the hill of Carthage is the narrow strip of land that divides the lagoon of Tunis from the sea, with Goletta, long a stronghold of the Moorish pirates, stormed by the Emperor Charles V., and again (after his troops had been withdrawn) the arsenal and fortress of the Beys, rising upon it at the point where a narrow channel gives access to the lagoon. And at the head of the lagoon, its smooth surface ruffled only by the flocks of pink-winged flamingoes that disport themselves in the sunshine, rise the minarets and cupolas of Tunis, glittering white across the blue waters, with line after line of hills seen behind it, growing dimmer and more delicate in their soft blue-gray tints till they sink beneath the western horizon on the borders of Numidia. As there are few more exquisite views in the world, so there are few which embrace a region more full of stirring and terrible events. For sixteen hundred years, down to the destruction of Carthage by the Arabs in A.D. 697, a fierce and strenuous life ebbed and flowed incessantly round this hill and on the plain that lies between it and Tunis. For twelve hundred years the hill has stood silent and melancholy as it stands now, and, in the words of Tasso,

> "Low lies proud Carthage; and the silent shore
> Keeps of her lordly ruins scarce a trace."

Correspondence.

CERTIFICATES TO THE UNIVERSITY.

To the Editor of The Nation:

Sir: Your correspondent in last week's issue of the *Nation* on "How to Build up a University" might well have made the application of his excellent remarks much broader. California is only one portion of a large territory where the higher education is based upon some form of the certificate system of admission to the university. I think that I am correct in stating that not one university or college west of the State of New York admits students solely upon the test of examinations given by the university authorities and marked by them. The new University of Chicago opened its doors five years ago on a strict examination system such as Harvard, Yale, Columbia, and all the strong colleges of the East have maintained, but within the past year it has seen fit to modify its position to the extent of passing upon the papers prepared by teachers of "coöperating schools." Further changes in the direction of permitting teachers and principals of affiliated and coöperating schools to enter their pupils at the University without examination by the University may be expected.

Your correspondent aptly points out that no European university or college in the Eastern States would consider for one moment accepting candidates that had not passed the university matriculating examinations with credit. But in the United States, territorially at least, the certificate plan in some form is dominant. The university education of the Mississippi Valley and the West is based upon the uncertain foundation of the preparatory school,

which may send to the higher institution, without any direct check, whatever material it chooses. The argument used in support of this brand-new educational policy is that "the conditions of the West require very different methods in education from those of Europe or the East." Practically speaking, however, the certificate system is a device for securing numbers, and each university is forced to adopt it from competition with its easy-going rivals. Schools will not send students to be examined by the university: such a requirement on the part of the higher institution is considered insulting to the dignity of the school-teacher.

The educators of the West may have discovered a new principle in education, to be adopted by the sister institutions of the East and Europe, but, in the meantime, they should explain why the universities of the West are from one to three years behind Harvard, Yale, Pennsylvania, and others in their requirements for the bachelor's degree.

Faithfully yours,

UNIVERSITY INSTRUCTOR.

JANUARY 8, 1897.

"UNCONSTITUTIONAL."

TO THE EDITOR OF THE NATION:

SIR: In addition to the numerous instances of the early use of the term "unconstitutional" cited by Mr. Albert Matthews in your issue of December 24, 1896, it may be mentioned that "Novanglus" and "Massachusettensis" made frequent use of this term in their well-known debates in 1775. In his letter of January 9, 1775, "Massachusettensis" says: "I suspect that many of our politicians are wrong in their first principle, in denying that the constitutional authority of Parliament extends to the colonies." In his letter of February 20, 1775, "Novanglus" (John Adams) asks: "Does not this show how deeply rooted in all men's minds was the abhorrence of that unconstitutional power which was usurping over them?" And in his issue of January 30, 1775, "Novanglus" quotes from Gov. Bernard's statement of propositions applicable to the colonial situation, of July 11, 1764, as follows: "76. The grants of the powers of government to the American colonies by charters cannot be understood to be intended for other than their infant or growing states. 77. They cannot be intended for their mature state, that is, for perpetuity, because they are in many things unconstitutional and contrary to the very nature of a British Government."

JAMES OSCAR PIERCE.

MINNEAPOLIS, MINN., December 28, 1896.

Notes.

J. B. LIPPINCOTT CO. have nearly ready 'Two Health-Seekers in Southern California,' by Beatrice Harraden and Dr. Wm. A. Edwards.

Julius Hoffmann, Stuttgart (New York: Lemcke & Buechner), announces 'Deutsche Wappenrolle,' containing all the escutcheons, standards, flags, etc., of the German Empire, its federal States and ruling dynasties, with 131 illustrations in the text and 172 escutcheons and flags in 22 colored folio plates.

In a brilliantly covered volume published by Macmillan, Mrs. Anna Bowman Dodd tells the story of a trip 'On the [Norfolk] Broads' in a wherry. The curious network of tidal rivers and lakes between Yarmouth and Norwich constitutes one of England's playgrounds, and has often been described before, but never with a keener appreciation of its natural beauties; nor has any previous writer on the subject enjoyed the advantage of Mr. Joseph Pennell's illustrations to glorify the text. As a lover of nature Mrs. Dodd is one of the old school. She rejoices in the browsing cattle, not only because they are picturesque, but because they are "yellow, or white, or dun, according as Nature painted them, and not violet, or pink, or dark purple," as the impressionists would have us believe. When she leaves scenery and describes her fellow-travellers, she is less successful. The leading character is a gentleman named Renard, for whom she frequently claims the possession of that rare thing called Genius. Unfortunately, she gives us specimens of his "monologues" on a liberal scale, and they signally fail to substantiate so interesting a claim. Then, again, Mrs. Dodd's pages show too many signs of carelessness. We note "Galicia" for Gallia, and such phrases as "He plunged into it *medias res*"; "the plumage of some swans were dazzling," and so forth. But in spite of these blemishes the book is a pleasant one, and every married woman who reads it will be struck by the profound wisdom of the remark that "where plans and projects are under discussion," married men seem to have a peculiar and irresistible tendency to oppose everything!

Readers of the *Nation* require no introduction to Dr. P. H. Emerson, whose delightful books on the Fen country have given him an almost exclusive right to this territory, so far as description and illustration are concerned. 'Marsh Leaves' (London: David Nutt), the latest of Dr. Emerson's volumes, is entirely worthy of its author. The little prose sketches of scenery and character are, of course, of varying excellence, but the best of them are extremely pretty, and they all show a keen sense for quietly picturesque detail. For the exquisite "photo-etchings" no praise can be too high.

Mr. C. H. Herford's "Warwick Library" (London: Blackie; New York: Scribners), which already includes such attractive volumes as Mr. Vaughan's selections from English essays in literary criticism and Mr. Chambers's 'English Pastorals,' has a new number, 'English Essays,' prepared by Mr. J. H. Lobban. There are, according to the plan of the series, no notes to speak of, but there is a long introduction, in which an attempt is made to trace the history of English essay-writing from its beginnings to the present time. As was to be expected, Mr. Lobban is not strong in the "origins," but he appears to better advantage when he has once comfortably reached Defoe; and the whole paper is worth while, making no great pretensions, and performing more than it at first seems to promise. The essays which form the bulk of the volume are in the main well selected, but only ten pages are given to Defoe's.

Harper & Bros. publish in book form Moscheles's 'In Bohemia with Du Maurier,' the volume containing somewhat more matter and a greater number of illustrations than the article with the same title published in the *Century*. From their *Magazine* the same publishers have collected the series of drawings republished under the title of 'English Society.' Both books serve to remind us of a talent that, whatever its limitations and mannerisms, had a savor of its own. How good Du Maurier was as a draughtsman we are even more clearly made aware by looking at the pages of *Punch* since his death. How good he was as a writer, is the theme of Mr. Howells's introduction to the second of these volumes, and he performs his task gracefully, though he has to explain the triumph of that "confidential attitude" which he had once found fault with in Thackeray, and had predicted that the world would not now endure.

Henry & Co., London, send us 'The Pageant' for 1897, an annual the make-up of which reminds one of 'The Yellow Book' and 'The Savoy,' but the contributors to which, both literary and artistic, are of a much higher order of talent. Austin Dobson, Edmund Gosse, and Maeterlinck are among the former, and Gustave Moreau, Rossetti, Burne-Jones, Puvis de Chavannes, and Watts among the latter. Yet it cannot be denied that the ragout is somewhat *faisandé*, and has a high *fin-de-siècle* flavor. Much reading in such magazines or long gazing on some of their pictures tends almost to make one sympathize with Dr. Nordau, and call out for a more Philistine diet of bread and cheese and a cup of cold water.

Cook-books seem to gravitate towards the new year equally with almanacs, calendars, statesmen's year books, and other annuals. No fewer than four are on our table at this moment. 'The Majestic Family Cook-Book' of Adolphe Gallier (Putnams), is not the most pretentious, despite its title. It is a straightforward array of 1,300 selected recipes, and a few specimen bills of fare, without illustrations. 'The Cook-Book of "Oscar" [Tschirky, maître d'hôtel] of the Waldorf' (Chicago and New York: The Werner Co.) is a sumptuous quarto, elegant in its typography, and numbering 879 pages of text and 27 of index. It, too, is free from superfluities of any kind, and is unillustrated. The binding implies handling elsewhere than in the kitchen. Marion Harland and Christine Terhune Herrick unite in a 'National Cook-Book' (Scribners) for which their names are a guarantee of excellence. It has a nursery table, and a curiosity of contrasted menus in an English, a French, a German, and an Italian dinner respectively. It is well made for serviceability. Finally, we fairly have a gift-book in Margaret Huntington Hooker's 'Ye Gentlewoman's Housewifery,' a dainty volume pleasantly archaic in the style of its instructions, and with many household suggestions apart from the table. The contents altogether are avowedly gathered from the scrap-books of a past generation, and are perhaps none the worse for that, as they must needs make for simple living.

It seems to be a difficult matter to reduce modern meteorology to elementary form. Davis's 'Meteorology' is elementary only in name, and is suited to colleges rather than to schools. Waldo's 'Elementary Meteorology,' recently published by the American Book Co., is condensed rather than simplified, but comes distinctly nearer to school needs than Davis's. The book may be depended on as a correct statement of the modern aspects of its science; but as a presentation of the subject it leaves something to be desired from the teacher's standpoint. The order of chapters places the simpler phenomena of temperature, pressure, winds, moisture, and precipitation in the first 160 pages; then follow the same number of pages on the general and secondary circulation, local winds, and weather and climate. An inductive order of treatment is attempted, but with too frequent or too early return to deduction. The chapter on temperature, for example, does not open with an

elementary statement of facts that call for generalization and explanation, but with a very much condensed physical explanation of heat, conduction, radiation; it then takes up solar heat and radiation, the orbital motion of the earth, and allied topics; next comes an account of thermometers and methods of observation; and not till fifteen pages have been passed are actual temperatures considered. The essentially difficult problem of the general circulation is not reduced to elementary form. It is doubtful if it can be so reduced. The book will, from its compactness, promote the study of meteorology better than any other now on the market.

Mrs. Elizabeth W. Latimer's 'Italy in the Nineteenth Century' (Chicago: McClurg) is one of those compilations of historical gossip which a certain class of readers mistake for history. It is, perhaps, too much to expect that gossip should be accurate, but certainly, where an author quotes very freely, often more than a page, from other works, at least their titles should be cited. Mrs. Latimer, however, usually appropriates without even giving credit. She has a provoking way of paraphrasing speeches, and of printing them with quotation marks, as if they were literally authentic. A single instance will illustrate her method; it refers to Charles Albert's memorable interview with Massimo d'Azeglio in 1845. "The sad face of the King suddenly brightened," she says, "his eyes flashed, and, seizing D'Azeglio's hand, he whispered in a low tone, as if afraid he might be overheard, 'Marquis, tell your friends that, when the hour comes, I will stake my crown, my life, and the lives of my sons for Italian independence!' Then, as if terrified at having said so much, he hastily withdrew" (p. 101). Now, D'Azeglio tells us nothing about having his hand seized by the King, or that sudden brightening of the eyes, or the dramatic whisper. He says that Charles Albert looked him straight in the eyes, and said calmly, but resolutely, "'Tell those gentlemen [the Liberals in Central Italy] to stay quiet and not to move, as there is for the present nothing to be done; but assure them that when the opportunity offers, my life, the life of my sons, my arms, my treasures, my army, shall all be spent for the Italian cause.'" And instead of slinking away as if frightened at what he had said, Charles Albert dismissed D'Azeglio in that dignified manner which any one who really knew his character would recognize as inevitable. (Compare D'Azeglio: 'I Miei Ricordi,' ii., 462-3). Is it worth while to write even "popular" history without greater regard for fact? The book has more than a score of half-tone portraits which give it real interest. We need not point out misprints and inaccuracies of dates, etc.; it is enough to remark that they begin on the title-page, where the solecism "Aus*tro* Hungary" appears in large type.

Sig. Tommaso Caivano, to whose work on Guatemala we called attention a year ago, has recently issued a similar volume on Venezuela (Milan: Hoepli), whither he went immediately after President Cleveland's message on the boundary dispute. Three-fifths of this book is devoted to a rapid and interesting historical sketch of Venezuela—a proportion which does not seem exorbitant in view of the fact that it embraces the exploits of Bolivar, Sucre, and Páez, the chief heroes of Spanish America. Sig. Caivano's descriptions of the natural beauties of Venezuela have a freshness that reminds one of De Amicis. Possibly it is because the modern Italians are not jaded with travel that they can write thus enthusiastically. Of the resources, whether mineral or agricultural, of Venezuela Sig. Caivano holds so high an opinion that he urges his compatriots to immigrate thither as strongly as he urged them to keep away from Guatemala. He reviews very favorably the state of education, finances, and public order, and believes that the Government has at last attained a stability which is not likely to be upset by revolution. In a final chapter he discusses the dispute with England over the frontier, and concludes, chiefly on Venezuelan and Spanish evidence, that England's claims rest on no sufficient basis. Throughout his work he confirms his statements by references to original authorities, many of which can hardly be procured in our libraries. The value of having such an account of the Spanish-American republics from an intelligent European need hardly be pointed out, for recent events have led us to expect that our Government cannot be withheld from meddling on slight provocation in the affairs of our neighbors, and it is all the more important that we should be well informed about them.

Prof. F. Ascherson's "Deutscher Universitäts Kalender," lately issued for the fiftieth time by Leonhard Simion in Berlin, gives the number of matriculated students in German universities during the summer semester of 1896 as 29,802, making an increase of 993 over the corresponding semester of 1895. This increase was in the following universities, the figures in brackets showing last year's attendance: Berlin 4,649 [4,265], Munich 3,777 [3,662], Leipzig 2,876 [2,788], Bonn 1,863 [1,760], Breslau 1,425 [1,407], Göttingen 1,007 [879], Marburg 965 [952], Greifswald 948 [879], Jena 761 [730], Giessen 630 [568], Rostock 500 [413], and the Academy of Münster 448 [409]. The following nine universities show a decrease: Halle 1,415 [1,465], Freiburg 1,379 [1,472], Würzburg 1,339 [1,342], Tübingen 1,172 [1,241], Heidelberg 1,164, [1,252]. Erlangen 1,138 [1,154], Strassburg 938 [986], Kiel 708 [749], and Königsberg 700 [756]. The statistics of collective attendance during the past five years show that the number of students in the philosophical department has steadily increased more than 24 per cent., and in the law department nearly 17 per cent., while the attendance in the medical department has varied with an increase of 270 in 1894, a decrease of 323 in 1895, and an increase of 101 in 1896. Students of Protestant theology, on the other hand, have steadily decreased nearly 30 per cent., and during the past year there has been a slight diminution in the number of Catholic students of theology. It should be stated, however, that Prof. Ascherson's University Calendar does not include the Lyceum Hosianum, a Catholic institution in Braunsberg (Prussia), with a philosophical and theological faculty and about forty students.

Sophie van Adelung's "Jugenderrinerungen an Sophie Kowalewsky," in the *Rundschau* for December, are valuable as a supplement to the Leffler-Cajanello biography; but these intimate reminiscences are fascinating reading by themselves. They are from the pen of a near relative and friend in childhood and girlhood who "knew the bud out of which the flower was to develop"; but they embrace also episodic incidents of the famous woman mathematician's mature life. Being told with a spirit both loving and discerning, they reveal to us a very original and very attractive personality. There is furthermore found in these pages interesting information concerning the mathematical endowment of some of Ssofa's maternal ancestors (Ssofa, not Sonya, is the abbreviation of Sophia by which the girl was always called in the family). Her grandfather, a second lieutenant at fifteen, was at that early age charged with astronomical observations on the White Sea. The early life on the vast family estate, so vividly pictured in the letters embodied in the article, must also have exerted its influence upon Ssofa's later development. The father's name, for some reason given as Ivan Sergeyevitch in the biography, was Vassili Vassilyevitch Korvin-Krukovskoy.

M. de Vogüé begins, in the *Revue des Deux Mondes* for December, a story, "Jean d'Agrève," to which lovers of French fiction of the more serious kind will thank us for calling their attention. There are pages in this first instalment whose rhythm and melancholy are those of Chateaubriand, and the story is sufficiently advanced to insure the gravity of the plot.

The *Critic* has concluded upon a monthly compilation from its own columns to be called "The *Month* in Literature, Art and Life," with the customary illustrations. The January number is before us, and enters the field with the *Bookman* and the *Bookbuyer*. On the other hand, the weekly *Outlook* adopts the octavo form (with cover) of the monthlies.

On January 15 the *Chap-Book* is to be enlarged "to the size of the English weekly reviews, and to begin at once the publication of criticisms of important new books"—these in addition to stories, poems, and essays, as heretofore, with pictures.

—A part of the price that we have to pay for our confederate form of government consists of the difficulties that it puts in the way of the collection of statistics. We have before us a volume published by royal authority containing the civil judicial statistics for England and Wales, and it is a natural impulse to institute comparisons between English and American conditions. But for the most part we of this country have few trustworthy data of this kind, and we must content ourselves with vague generalizations. The first impression which these statistics give is that the English are an extremely litigious people, for on the average there is one case in court every year for every 24 inhabitants, or say one for every five families. These are only civil cases; were the figures of the criminal courts added, the numbers would be even more startling. On the other hand, by far the greater part of these cases are in inferior courts and involve trifling sums; less than 7 per cent. of the proceedings originating in the High Court. The total amounts involved in litigation are, however, not large; assuming the total income of the country at the moderate sum of £1,200,000,000, only about one-third of one per cent. is ordered transferred in the course of litigation. This, we must remark, is exclusive of the chancery division. Through the Probate Court there passes £150,000,000 every year, and it may surprise some Americans to learn that the validity of wills is seldom contested; only 113 judgments in such cases being given in 1894, while the number of estates was almost 60,000. The thrift of the English people is shown by the fact that an estate was administered for every ten deaths, or at least one for every five adults, whether male or female; savings-banks deposits to the amount of £100 not requiring administration. It would seem that our ideas concerning costs in the English courts are exaggerated; Mr. Mac-

donell, who prepares these statistics, considers that £80 would be the average per case, in the Queen's Bench Division, including lawyers' fees. Even so it cost £200,000 to get judgments for £500,000. In the county courts the average amount claimed is only £3, and the costs and fees were at the rate of 7 shillings for every pound recovered.

—The figures under the Bankruptcy Act are very confused, owing to statutory changes; but it is evident that the number of insolvents has diminished of recent years in proportion to population, and that the amount lost has also diminished in proportion to the total capital of the community. Probably the most interesting figures are those relating to divorce. When the divorce court was first opened, the number of divorces increased rapidly, but recently it has been stationary. There are more petitions for divorce and fewer for separation; the former being usually employed by men, the latter by women. Even now there are six times as many petitions for separation as for divorce, and the number of wives' petitions is to that of husbands as 93.6 is to 6.4. Only about two-thirds of these applications are finally allowed by the court, a much lower proportion than in some other countries—France, for example. M. Bertillon has asserted that only rich people can afford to get divorces in England, but Mr. Macdonell shows that the costs are nearly the same as in France—about £30. In France, on the other hand, almost half the applicants are assisted by the court on their plea of poverty. Whatever the cause may be, there are now every year in France for every 1,000 marriages 28 suits for divorce, while in England there are only 2.4. In 37 per cent. of the English cases in 1894 there were no children of the marriages. Upon the whole, Mr. Macdonell's tables give a favorable impression of the administration of justice in England.

—Mr. Poultney Bigelow has republished, in two volumes, under the title of 'The German Struggle for Liberty' (Harper & Bros.), the articles which he recently contributed upon this subject to *Harper's Magazine*. In book form, the chapters seem even more patchy and sketchy than they did while appearing in monthly instalments. They are, in fact, a bundle of more or less vividly related episodes from the history of the German war of liberation, strung together without any very clear perception of historical proportion. It is in no sense a history, but it is none the less pleasant reading of its sort, and is free from the glaring blunders into which writers without historical training are apt to fall. Mr. Bigelow makes no attempt to be impartial. His hero is the Prussian people in its revolt against Napoleon's domination, though he gives full meed of praise to the men who roused and organized the heroic struggle, to Stein and Scharnhorst, to Blücher and Gneisenau, and to Arndt, Körner, and Father Jahn. Mr. Bigelow has followed Prof. Freeman's example and visited every spot of which he makes mention in the course of his story, and these visits give a personal and subjective touch to his chapters which is perhaps the most attractive feature of the book. Most of these visits seem to have been made in his canoe, and it is with some justice that he pays a tribute to his boat in his quaint dedication, stating that "without her this book would never have been written." The text is profusely illustrated from drawings by R. Caton Woodville, the well-known English painter of battle scenes. But the same fault may be found with these illustrations as with those in the more sumptuous 'Life of Napoleon' by Prof. Sloane, that they lack actuality. Among these fancy pictures, however, are some fine reproductions of contemporary portraits, which worthily supplement Mr. Bigelow's graphic descriptions of his leading characters.

—Coleridge's opinion that "it would be a fine national custom to act such a series of dramatic histories [as is afforded by the English chronicle plays] in orderly succession" seems to have suggested Thomas Donovan's 'English Historical Plays' (Macmillan), "arranged [in two volumes] for acting, as well as for reading"—a publication, however, which makes its appeal rather to the stage manager than to the reader. It is, of course, a convenience to have the chief English chronicle plays of Shakspere and of his contemporaries, which treat the dramatic events in the reigns of England's sovereigns in nearly unbroken succession from the last half of the thirteenth century to the middle of the sixteenth, printed in their chronological sequence, but, fortunately or unfortunately, Mr. Donovan's ideas of an editor's privileges are those of the eighteenth century improvers of Shakspere's text, or of the modern acting manager; and what he offers us is not the pure text of the Elizabethan plays, but that text adapted to the supposed exigencies of the modern stage. With perfect frankness the editor tells us the changes which he has adopted. Peele's "Edward I." is reduced to about a third of its original length; "Henry IV." is compressed into a single play, as is Heywood's "Edward IV."; the three parts of "Henry VI." have been recast and the dénouements transposed; while "Henry VIII." "ends with Queen Katherine's death, its true dramatic climax." The difficulties arising from too frequent changes of scene, which are met on the modern stage by the foreshortened drop, or in Germany by the arrangement known as the "Shakspere Bühne," have been overcome by Mr. Donovan by "the elision of redundant and unimportant scenes," whereby "nearly one hundred changes of scene have been suppressed in fourteen plays," and by "a new division of acts and scenes" whereby "nearly all the battles are now fought between the acts, and therefore out of sight." This is magnificent, but it is not literature. We do not deny the claim, Better thus represented than not at all, but in their printed form dramatic texts so improved are obviously not designed for the closet.

—It is a pleasant Continental custom, well worthy of imitation elsewhere, and not wholly unknown in this country, to celebrate an anniversary or an event in the life of an eminent teacher by a collection of essays on subjects connected with his teaching. The latest example of this comes to us in the shape of a comely volume of 'Études d'histoire du Moyen Âge, dédiées à Gabriel Monod,' on the occasion of this scholar's election to the presidency of the section of historical and philological science in the École Pratique des Hautes-Études. The dedication of the work is signed by former pupils, a numerous list, in which we find the names of nearly all the men who are bringing the modern French historical school on a level with that of Germany—Hanotaux, Eugène Hubert, the Moliniers, Weil, Giry—and it is a pleasure to see in the distinguished group one of our compatriots, Prof. Gross of Harvard. So large a proportion of the hundred and fifty scholars who have joined in this graceful tribute occupy professorial chairs in institutions of learning that it is not easy to reckon the extent to which the influence of M. Monod's teaching will penetrate among the rising generation of French students, or the results which it will ultimately accomplish. What this means is well indicated by an introductory letter addressed to M. Monod by his friend and fellow-student Ernest Lavisse, contrasting the methods of instruction to which they were subjected in their youth with those now in vogue, the introduction of which is largely attributed to M. Monod's efforts.

—In the old days the professor delivered a series of dreary discourses, in which he endeavored to convey in compact form the history of the world, or of an age, or of a nation—a crude compilation of facts, to burden the memory or to be forgotten, as the case might be—without exciting his hearers to think or to use their own brains. A legitimate outcome of the system was an essay, which M. Lavisse half confesses to have written, on the Laws of the Barbarians, without having read those laws, which he would not have understood had he attempted the task. In marked contrast with this is the modern method, in accordance with which the teacher, surrounded by a group of earnest workers, instructs them in the mysteries of palæography and diplomatics, or shows them how to investigate and elucidate passages in documents and chronicles, teaching them, not barren facts, but how to work and think for themselves, taking nothing for granted, but analyzing and comparing the sources of history with resolute determination to find the truth or the nearest approximation to it. The fruitfulness of the new system is well exhibited in the series of essays composing this volume. Of these there are thirty-one, each a brief and compact investigation into some doubtful point connected with mediæval history. It is all serious work, not glittering generalities whose coruscations serve to conceal the superficial knowledge of the writer. Naturally France occupies the larger space, but scientific training has overcome the particularism which so long seemed to identify the French horizon with the boundaries of the nation, and these studies cover a wide field in both time and space. One of the most interesting, in fact, is an inquiry, by Ch. Petit Dutaillis, into the connection between Wickliffe's itinerant priests and the rising of 1381 under Wat Tyler.

—The Crawford Collection of Charters and Documents, edited by Napier and Stevenson, in the 'Anecdota Oxoniensia' (Oxford: Clarendon Press; New York: Macmillan), is the most satisfactory specimen of English philological scholarship that we have seen of late. The number of charters is not large, only nineteen, but some of them are here edited for the first time, and all are valuable and interesting. The most interesting, perhaps, is No. vii., the Anglo-Saxon letter from Dunstan to King Æthelred concerning lands in Cornwall. According to the editors, it is probably a (contemporary) copy of the original, dated between 980 and 988. It is interesting, not only as a peculiarly happy expression of simple epistolary business style, but also for its bearing upon a vexed question in English ecclesiastical history. Scarcely inferior in interest is No. ix., the will of Leofwine, son of Wulfstan, from the circumstance that Wulfstan is one of the heroes in the well-known poem on Brihtnoth's Death, otherwise

called the 'Battle of Maldon.' Most of the charters relate to the monastery of Crediton. In all, the editors have printed 35 pp. of text and 131 of notes (including 15 of index). The ratio of notes to text may seem excessive to the ordinary student; but every one who has attempted to struggle with Early English diplomatics will congratulate himself upon the possession of such a volume. The editors have poured forth the richest treasures of linguistic and historical erudition, gathered from far and near. Literally, they have neglected nothing that might throw light upon their texts. From their conscientious labors the diligent student will gain a profound and novel insight into Old English affairs. We express the earnest wish and hope that the editors may not desist from their labors, their *mission*, in the truest sense of the term, but will give us, what we sorely need, an exhaustive study of the ill-digested mass of documents in Kemble, Birch, and Sweet.

THE JESUIT RELATIONS.

The Jesuit Relations, and Allied Documents. Travels and Explorations of the Jesuit Missionaries in New France. 1610–1791. Edited by Reuben Gold Thwaites. Vol. I. Acadia: 1610–1613. Vol. II. Acadia: 1612–1614. Cleveland: The Burrrows Brothers Co. 1896.

In 1854 the Parliament House of the United Canadas at Quebec was burned, and with it perished a wealth of documents relating to the Jesuits in North America. To repair in part the damage thus wrought, the Canadian Government issued in 1858 three thick octavos containing the Cramoisy series of Relations, eked out by a little supplementary material. The students chiefly intrusted with the task of editing were the Abbés Ferland, Laverdière, and Plante. The preface of this 1858 reprint begins by stating that, after the fire, "quelques amis de notre histoire désespéraient de retrouver jamais réunis tous les volumes des *Relations des Jésuites* qui ont rapport à la Nouvelle-France; d'autres, plus confiants, croyaient qu'un sentiment de patriotisme finirait par engager quelque éditeur à réédifier ce monument historique de nos ancêtres." Cramoisys were even then of the rarest, and students of Canadian history were beginning to realize the indispensable character of the Jesuit Relations. The result of some agitation at Quebec was that patriotism and antiquarian interest succeeded in bringing out a new edition of the work, which was good so far as it went, but which was manifestly incomplete. Now, after a lapse of more than forty years from the fire referred to, the Jesuit Relations are being published in proper and perhaps final form. The present series shows once again how signal has been the victory of New England over New France. The patriotism of the French Canadians is not the corner-stone upon which this large and important undertaking is based, but the historical curiosity of the English. Our modern zeal for every department of Americana is seldom disclosed more clearly than by the issue of these sixty sumptuous volumes. Mr. Thwaites and his assistants do, of course, rear a monument to the Jesuit heroes and martyrs, but one cannot doubt that their primary aim is to extend the borders of American history.

The Jesuit Relations are on many grounds worthy of the affectionate and solicitous care shown by their latest editor and his generous publishers. They are a revelation of religious enthusiasm, invincible ardor, and self-effacing modesty. They put this continent in touch with a great European movement, the Catholic Reaction. They are our surest source of information concerning the habits of savage life and the character of savage society. They furnish some political and much geographical information. Finally, their authenticity is unquestioned. It is not pretended that every letter written by a Jesuit on this continent, from the coming of Father Biard to the death of Father Well, a period of 180 years, has been found and printed. Sixty volumes would not contain one-quarter of their correspondence. But the best was culled by the local Superior, sent to the Provincial at Paris, and printed for him at the press of Stephen Cramoisy between 1632 and 1673. Immediate popularity attended their issue. The volumes were read almost out of their covers by the faithful who provided funds for the mission. Fresh and sometimes unauthorized editions appeared in both France and in Italy. Then, with the waning of Jesuit influence in the last half of the eighteenth century, the Relations drop out of sight. Two circumstances have contributed to secure their revival: the growth of historical interest, and the return of the Jesuits to America. During the past forty years half-a dozen additions of various kinds have been made to the contents of the Cramoisy series. This new edition embraces everything that has appeared, and marshals much fresh material besides. Mr. Thwaites has been aided by one especially serviceable friend. "The Reverend Arthur E. Jones, S.J., archivist of St. Mary's College, Montreal, from the first opened his heart to this enterprise, and has not only given us *carte blanche* to ransack his priceless stores, but has contributed invaluable suggestions and data, almost without number." The Lenox Library comes second in the list of acknowledgments.

We have attempted to indicate the many-sided importance of the Jesuit Relations. Historians of the Old World and of the New World can draw upon them alike. If one cares little about the missionary features of the narrative, he may still find it full of historical or ethnological merit. For our own part, we prefer primarily to look at this attempt to convert the savages from the standpoint of the men who were engaged in it, rather than with a view to securing incidental information. The joy revealed over the baptism of a single wretched half-dead Huron or Algonkin ought to have an inspiring influence upon one, even if he does not believe that the Indian was especially benefited by the rite. The whole field of biography may be ransacked from one end to the other without disclosing greater moral courage and physical fortitude than was shown by Brébeuf during the hours of his martyrdom. Nor must it be forgotten that many of these missionaries prolonged a living death through year after year and in the teeth of failure. While their brethren in Paraguay were sweeping 300,000 natives within the fold, the Canadian Jesuits led a forlorn hope against the barbarism of unteachable races. The story has all the romance of a fight against overwhelming odds, or even against the forces of nature.

Perinde ac cadaver might have been chosen by Mr. Thwaites for the motto of this series. Traces of complaint or of rebellious will never appear, and if, in reading the letters, we are apt to underestimate the degree of obedience required, it is only because their consuming enthusiasm gives the missionaries the aspect of independent pioneers. Acquaviva, Vitelleschi, Caraffa, even the shade of Loyola himself, are thrown into the background; yet the training of the Spiritual Exercises and the commands of the General lurk behind the deeds and sacrifices of Le Jeune, Garnier, Jogues, Lalemant, and Brébeuf. One can adjust the bearings of the Jesuit Relations only by regarding them as the record of a single phase in the history of that movement which began at the siege of Pampeluna, and which was not terminated with the suppression of the order in 1773. The perseverance of the advance guard against the heathenism of America is paralleled by the perseverance of the advance guard against the heresy of Europe. The animating impulse is the same in both cases. The Society of Jesus is an organism; its extremities must be examined as well as its torso. The history of New France, much more than that of New England, depends for interest on its European affiliations, and among these the Jesuit missionary movement stands out first.

The initial attempt of the fathers of the black robe to secure a foothold on this continent was made in 1611, when Biard and Massé landed at Port Royal in Acadia. At the outset they encountered two great obstacles, the difficulties presented by the Indian language and the rivalry of the English. They moved in 1613 to Mount Desert, and might have accomplished something among the well-disposed Abenakis had not the descent of Argall destroyed both colony and mission. A second attempt was similarly foiled by political reasons. Champlain brought over the Récollets in 1614, and reinforced them, as their numbers were depleted, by Jesuits. Brébeuf and Anne de Nouë, after receiving some rudimentary instruction in the Huron tongue, went to the field which had been abandoned by Le Caron, Viel, and Sagard. Brébeuf's first residence among the Hurons lasted three years. He had just returned to Quebec when Kirk's expedition broke up the colony and suspended French activity in America until after the treaty of St.-Germain-en-Laye. The Jesuits withdrew with the feeling that though their work had twice been interrupted by accidental causes, the chances of evangelistic success were good. They hastened to return when the English flag had been hauled down from the battlements of St. Louis. On July 5, 1632, Paul Le Jeune and Anne de Nouë landed at Quebec and laid the foundation of that celebrated residence, Notre Dame des Anges.

It cannot be urged that the Jesuits, during the period of their third attempt to convert the North American Indian, failed through the lack of a fair opportunity. They mastered the language difficulty which had been so great an obstacle to their predecessors. They entered all the principal nations, and ministered to them during times of pestilence and famine when, it might be supposed, the hearts of men would be most touched. Their French extraction and connections gave them a hearing and a toleration which would often have been denied to isolated individuals. They left no stone unturned which duty, heroism, and skill could move, and they were supported by whatever religious enthusiasm the Catholic France of Richelieu's era possessed. They were simply defeated by the ferocity and unteachableness of the Indians themselves. Beneath the strong light of the Jesuit Relations, Chateaubriand's idealized red man, and even Cooper's less extravagant type, vanish into thin air.

Le Jeune, the first Superior of Notre Dame des Anges, began his own efforts with the Montagnais branch of the Algonquins. In October, 1633, he set out for the Lake St. John

region with a roving band, and shared all its sufferings for six months. He sought to mollify the sorcerer of the tribe by praise and friendship, "which I threw to him as a bait whereby I might catch him in the net of truth." When the inevitable famine came, he erected a crucifix and a reliquary, and sent the hunters off with his blessing. Yet when they returned with game, they made bold to hint that they were not to be deceived by the fallacy of *post hoc ergo propter hoc*, and in their brutality excluded Le Jeune from their supper. He was the universal butt and accomplished next to nothing. Shaken in health, he was glad to reach Quebec alive.

While Le Jeune was pursuing the Montagnais in their Northern wanderings, three of his brethren were beginning the most notable of Jesuit campaigns in North America. During the summer of 1633 it had been resolved to attack once more the district which the Récollets had deserted, and in which Brébeuf alone had met with enough success to warrant the renewal of a mission. Lalemant five years later styled this Huron country "une des principales fortresses et comme un donjon des Démons." It held out, besides the allurements of a forlorn hope, the promise of far-reaching usefulnesss among tribes that were kindred to and partially dependent on the Hurons. Brébeuf himself, Daniel, and Davost were the three missionaries selected to lead the charge. After a year of linguistic studies they attached themselves in 1634 to the returning fur-fleet of the year, and travelled 900 miles from Three Rivers before they reached the settlements where they were to endure so much.

Parkman, whose sympathy with the heroic was very marked, mastered the details of the Huron mission and presented them to the general reader in permanent form. The means used by the Jesuits were crude, but well adapted to circumstances. Some of their contrivances to win the credence of the savages remind one of the villain's wiles in Stevenson's 'Beach of Falesà.' In place of the Æolian harp one has here a clock, a magnet, a microscope, and a prism. After the clock had struck its last stroke a father would cry "Stop," and the beholders marvelled at his superhuman power. Withal, converts came slowly, for the Hurons could not get over the difference between themselves and the French. The Christian God, they admitted, answered admirably for the latter, but was not susceptible of translation to the wilderness. Presents were accepted with alacrity; converts came slowly. A few dying infants were baptized, and unction was given to an occasional adult who was *in articulo mortis*. After three years the number of proselytes was only 100, and the braves laid the ravages of smallpox at the missionaries' door. Even the sound advice which the Jesuits gave in many practical matters connected with the war against the Iroquois (advice sometimes accepted, as in the case of fort construction), availed them little. After fifteen years of fair trial, the mission was already a proved failure when the Huron race perished under the tomahawk of the Five Nations in 1649. With the fall of St. Ignace, followed on March 16 by the torture and death of Brébeuf and Lalemant, the most dramatic incident of the Jesuit Relations ends.

Distinctly second in interest to the Huron mission, but still of great historical importance, are the missions to the Iroquois and to the Ottawas. The first of these fields was not abandoned till 1687, and the second not till 1781, eight years after the promulgation of the brief *Dominus ac Redemptor* which suppressed the Jesuit Order. The outstanding hero of the Iroquois mission is Isaac Jogues, tortured by the Mohawks in 1642, and murdered by them on his return to the region of Lake George in 1646. He was rescued by the Dutch from the hands of his tormentors, and returned in a mutilated condition to France, to be idolized by all devotees within the circle of Jesuit influence, including even Anne of Austria and her maids of honor. He could be persuaded to remain at home only three months. A consuming enthusiasm drove him back to the wilderness and its fiendish denizens. The seventeenth century presents few contrasts more strking than that of Anne of Austria kissing the lacerated fingers of Isaac Jogues. The Ottawa mission, at present best known through Marquette, is to receive fresh illustration during the progress of this series by the publication of his last journal, which has long been preserved in manuscript by the Jesuits of St. Mary's College, Montreal.

The Relations themselves are of very unequal historical merit. The fathers were so concerned about the spiritual condition of their converts that they become prolix in describing both morbid and healthy symptoms. The following headings from a Relation of 1640 show how religious pathology comes in: "Des Sauvages baptisez, et des bonnes actions de cette nouvelle Église." "Continuation du mesme discours." "Continuation du mesme sujet." "Continuation des actions de nos nouveaux Chrestiens." "De la bonne disposition de quelques Sauvages non encore baptisez." "De la providence de Dieu au choix de quelques uns et au rebut de quelques autres." "De l'espérance qu'on a de la conversion de plusieurs Sauvages." Many things which were of vital moment to the missionaries are incidental matters to us, while what they regarded as the incidental conditions of their work are matters of vital moment to the modern historian. Concerning the value of these letters to the ethnologist there can be no two opinions. Parkman covers the ground in a single sentence when he says: "With regard to the condition and character of the primitive inhabitants of North America, it is impossible to exaggerate their value as an authority."

Some months ago, in referring to the project of this new edition, we indicated its monumental character and the care taken to render it in every way worthy of its subject. The first of the sixty volumes quite equals our expectation in respect to both editing and printing. Mr. Thwaites's general introduction is admirable; succinct, yet comprehensive. The translation is exact without being awkward. In a word, the editors and the public have every reason to expect the fortunate conclusion of a great task. The opening volume deals with the Acadian Mission from 1610 to 1613. Lescarbot's "Conversion des Sauvages" and the seven other pieces which accompany it form a prelude to the more crowded action of the years succeeding Le Jeune's establishment at Notre Dame des Anges. The two last, "Canadicæ Missionis Relatio" and "De Regione et Moribus Canadensium," are not contemporary with the rest. Their author, Father Joseph Jouvency, wrote at the beginning of the eighteenth century about the Acadian mission and Indian characteristics. His Latin is very tolerable and has been well Englished by Mr. Giese and Mr. Wolcott.

Mr. Thwaites asks for suggestions, and we hasten to make one. In order to secure perfect accuracy of reproduction the editor follows earlier usage in putting *Les Relations des Jésuites* at the head of every page. This tells the reader nothing, whereas *Lescarbot, Biard*, etc., would catch the eye and facilitate reference. Librarians, especially, would thank Mr. Thwaites if he made his headlines indicate the nature of the contents. We have found no inaccuracies worth mentioning in the first volume. One misplaced grave accent on p. 42 and a slight misapprehension in the map as to the true source of the St. Francis River are the merest trifles. Mr. Thwaites appears to us to underestimate the Huron population in the statement that it "numbered about 16,000 souls." Brébeuf, writing in 1635, places it at 30,000. "Il y a vingt Bourgades, qui disent environs trente mille âmes, sous une mesme langue, et encore assez facile à qui a quelque maistre." However, the question is difficult to determine.

Three of the four documents in the second volume relate to Poutrincourt's colony at Port Royal, and the other is a general account of Jesuit experiences in 1613 and 1614, including a description of Argall's descent upon the French at Mount Desert. The practical value of Mr. Thwaites's work is disclosed by a reference to the bibliographical data given at the end of the book. Each of the pieces comes from a separate source: the first, Biard's "Lettre au R. P. Provincial, à Paris," from Carayon's 'Première Mission'; the second, Biard's "Missio Canadensis," from O'Callaghan; the third, Lescarbot's 'Relation Dernière,' from a copy in Harvard College Library; and the fourth, the "Relatio Rerum Gestarum," from the "Annuæ Litteræ Societatis Jesu." Poutrincourt was a man after the Jesuits' own hearts, and he is deluged with praise by both Biard and Lescarbot. He became an intimate friend of the chief sagamore of the Siroquois, Memberton, a person who is portrayed as having been half a Christian before Christianity was preached to him, and as having alone among the converts proclaimed Christianity by his life. Lescarbot gives an interesting list of the French nobles who stood sponsors to the earliest native proselytes. The first half dozen personages on the roll are the Prince de Condé, the Prince de Conty, the Comte de Soissons, the Duc de Nevers, and the Prince de Joinville! This instalment of Jesuit Relations is free from tedious detail concerning the professional aspects of the mission, and will even afford entertainment to the lover of adventure who has never heard of Poutrincourt, or Biard, or Port Royal.

We trust that the remainder of the series will, like the present volumes, demand nothing beyond monotony of praise.

PROFESSOR SKEAT.

A Student's Pastime. By the Rev. Walter W. Skeat. Macmillan Co. 1896.

ANOTHER volume by Prof. Skeat, of nearly 500 pages. It is number 58 in the list he gives of the books he has seen through the press, and many of the numbers cover several volumes. The proof-reading alone of all these books must have been a great task. But having become accustomed to Prof. Skeat's productiveness, students of English would be surprised if he did not turn out two or three volumes every year. That his books are welcome is a matter of course, and this one will be so, though in a different way from most

that have preceded it. The volume has two parts: an introduction of nearly 100 pages, and a collection of the author's contributions to *Notes and Queries* during the past thirty years. The introduction consists of an autobiography, and a sketch of the various philological and literary enterprises with which the author has been remotely connected. He puts himself and his work before the world in a way that challenges and justifies a consideration of the personal aspects of his career. The life of a man whose name is familiar to every lover of his mother tongue must be a matter of interest to many of them. It is evident that Prof. Skeat thinks so himself, and therefore he lifts the veil of formality, and gives us an opportunity of peeping in upon his private life. This he does with amusing naïveté and pride.

He was born November 21, 1835, "five years before the Princess Royal, as she used to be called, on the same day." This was in Mount Street, Park Lane; but from his second to his fourteenth year the family lived at Perry Hill, Sydenham. He, thus, early became acquainted with the dialects of West Kent, London, and Essex, but more particularly with that of South Shropshire, where he often visited relatives. For a time he was at King's College School in the Strand, under the instruction of the Anglo-Saxon scholar Oswald Cockayne, who taught him Latin, however, not Old English, and from whom he believes he "imbibed the notion of what is known as scholarship." At the last school that received him, "that of Sir Roger Cholmeley at Highgate, founded in the reign of Elizabeth, in 1565," he obtained as a prize a copy of Stevens and Malone's Shakspere. Here, too, he got some idea of the value of English literature; "for it was customary to give the boys occasional scraps of it, on which to exercise their skill by translating them into Greek and Latin verse," but he adds that no portion of our literature was ever explained to him at any of his five schools. There was, however, a fine edition of Spenser in the library of one of the schools, and he devoted himself to a careful study of it. During a year spent at Cambridge in preparation for college, he became familiar with other English writers. He thus acquired a love for English literature, and consequently ventures to indulge in certain naïve judgments on literature and the study of it. To the earlier literature and to philological study his attention was first drawn by one of his school-books, Mrs. Markham's 'History of England.'

"Desirous of entering a college which should be large enough for forming acquaintances, and not so large as to overwhelm me with competition," he entered Christ's College, and gloried in being a fellow-collegian of Milton and Darwin. In 1870 he was elected to a fellowship, but soon after was ordained and spent the first two years of his married life as a curate of East Dereham, where he became familiar with the Norfolk dialect. In the parish church is the tomb of Cowper; and in the hall of one of the principal houses in the market-place he was shown "the sofa." His next curacy was at Godalming, nearer London; but the climate proved unsuitable, and at last an attack of a diphtheritic character totally unfitted him for clerical work and rendered a long rest necessary. In the vein of the earlier novelists, he says:

"I thus found myself, in the end of 1863, at the age of twenty-eight, in the desolate condition of finding my chosen career brought to a sudden end, without any idea as to my future course, and even without much prospect of ever again rendering any help to my fellow-creatures, which (I can truly say) has always been my object as regards this present world. Man proposes, but God disposes," etc.

He returned to Cambridge, where he became a mathematical lecturer, and received private pupils. As this left him much time, he took up the study of Anglo-Saxon, and soon fell to making glossaries and editing Middle English texts. In 1878 he was made Professor of Anglo-Saxon in Cambridge on the foundation of Dr. Bosworth. Of his professional duties he says:

"Considering that Anglo-Saxon is not a subject in very great request, it might easily have happened, especially at the beginning of my professional work, that I might some day be prepared to lecture, and might find no one to listen. Curiously enough, this has never actually happened; in every year there have been some two or three at least who, for some reason or other, have wanted instruction."

At one time he took an *ad-eundem* degree at Oxford and had an opportunity of seeing something of Oxford life. He still visits the neighboring university from time to time, and, in characteristic words, expresses his idea of that sort of thing and of the mutual relations of the two great seats of learning:

"It is a good thing for a student of one university to know something of the ways of the other, without actual migration; and I rather wonder that the idea is not more frequently entertained. The chief reason against it is to be found in the detestable arrangement whereby the London and Northwestern Railway compels every traveller to spend three hours over a journey that might be completed in a little more than two. An enforced wait of three-fourths of an hour or so at the cheerless Bletchley station is decidedly unaccommodating and ruthless; and there can be little doubt that this is the chief cause that keeps the two Universities apart."

And this is about all that the modern English lexicographer has to tell us of his life. The spirit that pervades it does not seem to be a genial one. We see much of the pugnacious tendencies of Hughes's Brown family, but miss their more kindly qualities. The English curate did not change much when he became a philologist. He holds that "every true scholar is in some degree a missionary," whose duty it is to "fight against all the forms of error that beset the study" to which he has devoted himself. And of fighting Professor Skeat has done not a little. He relished Zupitza's gentleness in pointing out his slips, but he wonders when others find fault with his own severity. There surely is a high-handed way in much of his criticism; but we must not forget that he lives at an English university where every one feels himself justified in explaining and laying down laws for his mother-tongue, no matter what his ignorance of the language and of philological principles in general. It is, doubtless, a shame, but it is, perhaps, none the less true, that there is still need in England of such long and reiterated contentions as those that Professor Skeat makes against the idea that the Romans pronounced Latin as we pronounce English, and that modern English is derived from modern German. A sadder thing is that the denouncer of English weaknesses is himself a product of English conditions. He, too, lacks the thorough training that the German scholar has received; he, also, fails to avail himself of all the results of the work of other scholars; and, like some of his countrymen, he has a tendency to guess and to ignore linguistic principles. In his very efforts to be a scholar of the world, he betrays his insularity. Speaking of the advance in our knowledge of Old English, he says: "Perhaps the most unexpected result of modern times is the extension of Anglo-Saxon studies to the continent of America." He all too frequently shows anxiety lest the world forget that it was he who first found out this etymology or put that idea into words; and now for the third time he boasts in print that he can read Middle English as easily as the English of to-day. All development in philological study in England he regards as circling about and dependent on him. And because certain Continental etymological dictionaries (like Kluge's) have appeared since his was published, he regards them as inspired by and modelled after his book.

Of his friends we learn a little here and there, but mostly concerning their externalities, their peculiarities, and their favorite stories. Of Kemble he says: "I remember him as a quiet but cheery old gentleman, who more than once stayed with me when he came to Cambridge to consult MSS. He had sharp, quick eyesight, and wrote a very legible hand at a quite unusual pace." It is amusing to see the philologian come out even at the bedside of the sick: "Miss Jackson became a sad invalid in her later years, being confined to one room and often to bed for long periods, and suffering much pain; but she bore her trials with much courage and even cheerfulness, and at all times took much interest in English dialects and etymology."

The body of the book need not detain us long. Much of the matter is valuable—just as are many of the other contributions that appear in *Notes and Queries*. Why, however, such matter should be reprinted in a volume with no other bond of union than that it was written by the same man is a mystery. Skeat's contributions to *Notes and Queries* deal with etymology, with the history of the English language, literature, and people, with dialectic and provincial English, with proverbs, folk-lore, superstitions, sleight-of-hand tricks, and what not. He discusses the first burning for heresy in England; quotes a "poem" that Sir William Davenant contrived to write with hardly a *the* or an *a* in it; and gives a recipe for making two-faced pictures by cutting them in strips which show one picture or word as you approach and another as you pass; and he gravely adds: "[P. S. Now (in 1895) used to advertise 'Sunlight Soap.']" He urges that it isn't fair to write badly, hoping thus to have one's MS. put into the hands of the best compositor in the printing-office:

"The morality of it is more than questionable; and it ought surely to be understood, amongst gentlemen, that a writer who *purposely* writes illegibly commits a most cowardly and unjustifiable crime against the unfortunate compositors. [P. S. in 1895. I have always found that the compositors set up my 'copy' admirably; precisely because they appreciate its legibility. The Controller of the Clarendon Press is my witness to this.]"

Many of the really philological contributions Skeat made to *Notes and Queries* were confessedly unoriginal—a five-page outline of Germanic phonology, a ten-page list of English grammars "made many years ago by Sir F. Madden . . . from cuttings from booksellers' catalogues"—or had a temporary purpose only, as, for example, six pages of additions to Halliwell's Dictionary published by Skeat for the use of Dr. Murray, who was at the time engaged on the letters in question; but all this is reprinted here. In the introduction the author actually reprints almost the entire preface of his Dictionary—nine

pages in all—with the plea that, as "few people read a preface to a dictionary printed in quarto form, it will probably be new to most of my readers." It would, indeed, be difficult to find another such case of book-making. The introduction closes with the remark that the author has made similar contributions "to many other publications besides *Notes and Queries*, and that, if the reception of the present book is sufficiently encouraging, it will be easy to produce another volume, or even two more, of a like kind."

We trust that Prof. Skeat will carefully consider this matter. It is doubtless very easy to make books in this way, and they will sell. But as he certainly has at heart the welfare of his science and the advantage of his fellow-scholars, it will not be difficult to persuade him to do his reprinting in a different way. It is now fourteen years since he issued the supplement to his Dictionary. Since then he and many others have contributed much toward the advancement of the subject. The material is in so many different journals that, even if one has access to them all, as few have, the time needed to run down a question is rarely at one's disposal. If Prof. Skeat will bring all this material under one alphabet in the form of a supplement to his Dictionary, even if he has time to do no more than reprint the material without digesting it, he will do all English scholars a great service and make a very salable book. He can then, if he chooses, gather his miscellaneous contributions into another volume, which will "interest the curious." But even in this we hope he will not reprint well-known facts merely "because I had much to do with their enunciation or explanation, and their appearance in *N. and Q.* has become a matter of history."

La Jeunesse d'un Tsar. Paul 1er et Catherine II. Par Dmitri Kobeko. Tiré du Russe par Dmitri de Benckendorff. Paris: Calmann Lévy; New York: Brentano's. 1896.

To the perennial interest in the character and reign of Catherine the Second the special interest is added, just at the present moment in Russia, of the centenary of her death. To that intensified interest, in anticipation, no doubt, is due the volume upon Paul I. which this French version represents. The reign of Catherine II., and the part which her son played therein, as well as during his own very brief reign following, are inexhaustibly absorbing themes for Russian writers, as well as for historical investigators of foreign lands who desire to fathom the present policy and aims of the giant empire, since they, almost equally with the reign of Peter the Great, lie at the bottom of many problems. One of the attractions of the subject lies in its difficulty, for both the native and the foreigner; though the difficulty is diametrically opposite in the two cases. The foreigner, who is free to tell the whole truth about the Empress Catherine's moral character and her policy at home and abroad, and is anxious to show as little reserve as possible, rarely has access to original documents in Russia, even when he is capable of deciphering them. Paul I.'s life, and especially his death, which require the examination of such documents, present another difficulty equally great. The Russian who may have access to state and other papers has to pass the censorship. It may be merely an accident that several noteworthy Russian histories either come to a sudden end with the reign of Catherine's predecessor, or devote but scant space and obscure allusions, in place of full and open dissection, to the famous Empress's long and vitally important reign and to Paul's brief and tragic career on the throne. For these very reasons, every new volume on the subject is read with eager interest and hope that some new or authoritative light may be shed on debated points.

It cannot be said of the volume before us that it adds anything of particular value to our previous information, despite its interest. It forms the introduction to a promised study of the reign of Paul I., and suffers from this division of what ought to be one integral whole. This in the first place. In the second, the translator has very honestly but bafflingly announced on the title-page that it is "drawn from" the Russian original. Why he should have hesitated to publish in France what was permitted in Russia is a puzzle, especially as it leaves the reader in doubt as to whether the evident excisions throughout and the decidedly scrappy abruptness of the early chapters are due to the author or to the adapter. It is plain that adverse criticism must be confined rather narrowly to the adaptation, and does not, of necessity, apply to the Russian original.

To begin with, it would be of interest to know whether the author entertains any settled views as to the parentage of Paul I., which has often been questioned, and as to whether that or her jealousy of his right to the throne and her insatiable ambition alone were the cause of Catherine's harsh treatment of her son. Hazardous as is this point, it could have been dealt with in a manner which would have added to our definite knowledge without incurring danger from the official critics who rule on such affairs in all monarchical lands; and the author, shortly after he has mentioned Paul's birth, proves that he thoroughly understands the method of conveying his meaning by the proper sort of hint. For example, in narrating Catherine's invitation to D'Alembert to become her son's preceptor, he quotes D'Alembert's letter to Voltaire on the subject: "Do you know that I have been invited—I, who have not the honor to be a Jesuit—to undertake the education of the Grand Duke of Russia? But I am too subject to hemorrhoids, and they are too dangerous in that country." This is a fairly plain allusion to the fact that Catherine's agents had made away with her husband, the Emperor Peter III., at the palace of Ropsha, and that the bereaved widow had announced to his (her) subjects his death as caused by hemorrhoids. It remains to be seen which mode of treatment the author will apply to another royally sensitive topic in his second volume, namely, the manner of Paul I.'s death and the share therein of his son, Alexander I.

The special value of the present book lies in its ample quotations from the autobiographical notes of the persons concerned, and the diaries and reports of the notable men, foreign ambassadors as well as Russian dignitaries, of that epoch. It is curious to see how Catherine robbed her son of all his children at their birth, after we have read her own pathetic complaints against the Empress Elizabeth's identical treatment of herself, wherein she says that, in the course of the first seven months of Paul's life, she was allowed to see him but thrice. In many other instances similar instructive parallels might be drawn between the different passages of the book; as, Catherine's fickleness in the majority of her affections, and obstinacy in isolated instances which are not generally regarded as legitimate causes of blame in her case, while Paul, who is admitted to have been infinitely her superior in morality, is ordinarily censured for his sudden warm affections in friendship, and his later coldness, and his occasional obstinacy. The crudity of these comparisons is lessened by the dexterous way in which the author has arranged the extracts from the records of personal intimates and preceptors of mother and son.

Paul, as Grand Duke Heir, had much to endure from his imperious, jealous, and selfish mother, and he bore it, with very few exceptions, in the most admirable spirit of filial respect and loyal obedience as first subject in the realm. His character, in this light, as well as in his domestic life with his two wives, during his painfully long ordeal of banishment from his mother's heart, confidence, and favor, is set forth in the most amiable and most just manner. It was only towards the end of Catherine's reign, after many years of brave resistance to the undermining effects of cruel treatment and intrigue against him from his mother, that Paul's character changed for the worse, and his irritable, overbearing, hereditary temper took on the distinguishing tinge of mental aberration. Not only is this gradual deterioration adequately shown, but the author succeeds in making the unfortunate Paul a vivid personality and sympathetic to feeling hearts, while preserving the atmosphere of aloofness which especially characterizes the ordinary conception of his position. He makes it perfectly clear, even to the prejudiced reader, that Paul I. was well endowed mentally, fit to hold his place with the best royal personages of his time; a devoted husband, an admirable son, with qualities which might have made him a great ruler, and saved him from the military-martinet mania which was fostered, perhaps created, by his mother's attitude. This, by estranging him, excluding him, from all state business and councils, made him fix his residence chiefly at Gatchina and Pavlovsk, and busy himself to wearying minuteness with the petty points of military life and drill, in the hours when he rested from assiduous cultivation of his mind in his wife's famous literary circle. This second wife, Marie Feodorovna, is delightfully portrayed. A model wife, mother, Empress, her memory is revered and always will be in the land of her adoption, where her influence still lingers. A lady of the Court still regards it as the highest praise if she earns the verdict: "She is of the school (of manners and conduct) of Marie Feodorovna."

One misses many charming and vivifying details, both in her life and in that of her husband, which would have added greatly to the picture, had it been possible to weld this volume and its promised sequel in one work. Nevertheless, with all its omissions, reticences, and brevity (it seems brief, though it covers 425 pages), it is a book to read and to keep. The final summing up of Paul's character is worth quoting as an introduction and incentive to the perusal of this biography:

"What had a decisive influence upon his character was the fact that, from his early infancy, he had, in a manner, been imbued with reasons for fear and with suspicions, and that his extreme need of activity had been constantly thwarted until, on arriving at mature age, he ascended the throne. There is no doubt that, under no reign so much as under that of Paul, could so much good have been done to the country, had the persons who surrounded him been guided by the love of their country, instead of being actuated by wholly personal aims."

The general prejudice against Paul I. is so strongly rooted abroad that this judgment should be borne in mind by those who would

reach a just estimate of the man and of his epoch.

If any later editions of this book should be called for, it would be well that a competent person should make a thorough revision. The errors in the Russian names, the varieties of orthography even on one page in one name, are embarrassing to foreign readers. There are also errors in dates, and (which is surprising in a publication of a well-known house) errors in the French.

Outlines of the Philosophy of English Literature. By Greenough White. Part I. The Middle Ages. Boston: Ginn & Co. 1896.

ENCOURAGED by the deservedly favorable judgments passed on his sketch of the 'Philosophy of American Literature,' Mr. Greenough White has essayed a harder task. With the Middle Ages for his period—and these he has construed as beginning with the twelfth century and ending with the death of Bloody Mary in 1558—he has endeavored "to describe the process of mental development; to determine the limits and character of literary ages; to get at the basal principle of each successive age and trace its derivation from that which preceded it." His method requires him to study the political, religious, and social history, not merely of England, but of France, Italy, and Germany, and to trace the relations of these complex matters to the origin and development of English literature in the period—or rather the succession of periods—which he desires to characterize. To accomplish all this in the compass of 266 pages would demand, not only a great deal of knowledge, but powers of compression and unification quite extraordinary.

We shall not question Mr. White's possession of these powers, nor shall we enter into a discussion of the soundness or extent of his historical acquirements. Such a discussion is not necessary, for, unhappily, his work has one fundamental defect which no amount of literary skill or historical learning can supply: the author's acquaintance with the literary monuments of his period is insufficient. If a writer does not know the facts of a subject broadly and solidly, it may well pass for axiomatic that he cannot profitably discuss the "philosophy" of that subject; and this, we regret to say, is Mr. White's case with regard to mediæval English literature, and, indeed, with regard to mediæval literature in general.

To begin with, his account of the Anglo-Saxon period is vague and ineffectual. We shall not quarrel with him for refusing to regard Anglo-Saxon as English, and for making English literature begin with Layamon. There is a kind of justification for this point of view, and, even if there were none, the hyperbole of some professed Anglo-Saxonists might easily drive the most philosophical historian of letters into an extreme position. What we object to is Mr. White's failure to see that one cannot explain English literature from the Norman Conquest to Chaucer without determining, first of all, the literary and intellectual characteristics of the people conquered, and that this cannot be done without a study of Anglo-Saxon literature, such as it is. In the eleven pages which Mr. White gives to the Saxon period, he had space enough for just such a rapid summary as was needed; but his knowledge of the subject was apparently inadequate, and we have, instead, a string of rambling and often misleading remarks, of no value and little significance. It would have been better to omit this chapter altogether.

Scarcely more satisfactory is Mr. White's treatment of the Middle English period. A writer on mediæval literature is surely bound to give some clear account, however brief, of "the matter of Britain," "the matter of Troy," the "romances of adventure," the *chansons de geste*, the influence of Oriental fiction. Mr. White knows that there are questions about all these things, but he is unfamiliar with the best authorities on the several subjects; in fact, he has no clear conception of the real problems in each case. His account of the Arthur romances, for instance, is strangely inaccurate and incomplete, though he considers them at some length. Walter Map is unquestioningly credited with an Anglo-Norman prose 'Quest of the Holy Grail,' and with "part, at least," of a 'Lancelot du Lac.' Chrestien is mentioned only as "a prolific versifier" who "made the Grail the motive of his romance of 'Percevale.'" We see no evidence that the author has read a line of Chrestien, or that he has pushed his researches far enough to discover a catalogue of his works. For Tristan we are referred to Gottfried von Strassburg: there is no suggestion of the origin or relations of Gottfried's poem. The great problem of the *Lais* is not even mentioned: Chestre's 'Launfal' is put in the reign of Edward IV., and there is no hint that it has any connection with Marie de France. To 'Gawain and the Green Knight' two pages are given, but the story is told with curious inaccuracy, and the conclusion of the whole matter is perversely made into an allegory. "What is the Green Knight," we are asked, "but a type of nature—not the inanimate world, but the deathless life that is in nature?"—and so on, in a strain that would astonish the fourteenth-century poet if he could hear it.

The Round Table romances are not the only subject in Middle English on which Mr. White's information is imperfect. Nothing could be more erroneous than what he says about Sir John Mandeville and his 'Travels.' He still believes the old story, long ago exploded, about Sir John's being an English traveller who wrote originally in Latin, afterwards making a translation of his own book into his mother tongue. Yet it would not have been hard for Mr. White to avoid these mistakes. Even so accessible a work of reference as the 'Encyclopædia Britannica' would have set him right. The chapter on Chaucer is unsatisfying, both from the scholar's point of view and from the critic's. To ascribe 'The Court of Love' to Chaucer after all that has been said and written on that unlucky poem, is a literary sin that can claim slight indulgence. For Gower Mr. White has a somewhat excessive admiration.

We have given this little book more space than it deserves because it is a kind of "type." It is interesting, well-written, brief, and its fundamental design is good. All these qualities make it attractive, especially to the "general reader" in our scrambling decade. But it is too inaccurate to be a safe guide to those most likely to resort to it for assistance.

Scholar Gipsies. By John Buchan. Macmillan Co. 1896.

THIS book interests in the beginning because it is printed for the "Arcady Library" from the strong types of the Bodley Head Press; next, because the few etchings, by Mr. D. Y. Cameron, which illustrate it, have a curious individuality, not unpleasing. The title piques a curiosity more easily satisfied, for it is merely the label which the author has chosen for the first of a number of essays on life and nature in the upper valley of Tweed, treating of the men of those uplands, their traditions, country, beasts, birds, fishes, trees, and flowers—the very quality of soil and atmosphere that makes them at once shrewd, sagacious, reckless, passionate, practical, and imaginative. These essays, he tells us, were all written in youth. Of youth they certainly retain the fervor and enthusiasm; but they are written in a mature and cultivated style. Their substance is charming, and, albeit concerned with Scotch life and nature, is novel. The Scotch classics and our contemporary favorites of the Scotch renaissance have made us familiar with Scotland's historic places—the cities and the Highlands; but Peebleshire we scarcely know at all, in spite of its traditions of border warfare, and its endearing scenery, which Mr. Buchan describes thus. It is, he says, "an epitome of landscape," "a country of surprises."

> "The cottar's garden, gay with all seasons' flowers, runs into the heather; reapers ply their trade within hearing of the thrush and the curlew; a meadow of hay is own neighbor to a grim pine forest: and a sullen stream in one field may be an eddying torrent in the next. The art of the epigrammatist would be expended in vain in searching for the applicable word. One might call it austere, but for the grace of the woods; barren, but for the fresh, green meadows and fruitful gardens; homely, were it not for some great blue shoulder of hill which bars the sky and gives solemnity to the little ridges. It is a country of contradictions, blended into harmony by that subtle Border charm which relates the crags of Moffatdale to the lowlands of Berwick."

Of the character and life of its people, Mr. Buchan makes a portrayal both vivid and enduring. He is sparing of anecdote and still more sparing of dialect, but he achieves his end through the affection with which he has studied his neighbors in their relations to each other and to nature—a love of humanity akin to that which animates Bewick's sincere woodcuts and White's simple natural history of his Selborne parish. He takes you a tramp over the moors, on the track of the abandoned drove-road worn by the herds that, ere the advent of railroads, came from the north, in charge of men as rude and picturesque as our Texans. He goes salmon fishing with you in the early May mornings, flushing many a bird by the wayside, and maybe surprising a poacher, clandestinely enjoying the sport forbidden him by law. Mr. Buchan has charity for such lawbreakers. The poacher may be a blackguard, "but he would be a worse man were he not a poacher." "It is something affecting to see the ragged weaver, out of work maybe, up to his knees in the stream, intent upon his fishing; the herd-boy who whips the mountain burn with his home-made rod"—for "they love it and are learned in it above the common."

Mr. Buchan sees all things with the same sweet and healthy imagination, and his book brings up pleasant thoughts of a generous country and a kindly people; of big hills to climb, broad moors to tramp, and swift streams to fish, over; and of stirring days that will not come again—of the sudden rush of the border foray, the dusty herds with their dour escorts, the camp-fires along the road, "the menace of visionary dogs and the confused speech of drovers who have long since ceased from their toil."

The Myths of the New World. A Treatise on the Symbolism and Mythology of the Red Race of America. By Daniel G. Brinton. Third edition, revised. Philadelphia: David McKay. 1896. 8vo, pp. 361.

To collect into one volume the myths, beliefs, and religious ceremonies of all the aborigines of both Americas—countries of such an enormous extent and diversity—has been frequently attempted, but could never fully succeed on account of the immensity of the task and the fragmentary condition of the material at hand. It is true that special myths are found to be disseminated over large areas and worded in approximatively the same terms. Myths of this kind are: the creation of the land from sand or mud hauled up from the bottom of the primeval ocean; the road to the sky formed by arrows; the red cedar containing the blood of human beings; the coyote-wolf as the creator of the universe, and many others. But the ownership of such myths by no means proves the identity of the mythologies of the nations whose religious life rests upon them. In some nations the chief deity, to which all others appear subordinate, is the sky, when unclouded; in others it is the clouded or stormy sky, torn by thunder and lightning; in others, again, it is the fire or light which stands highest, but most frequently the sun is first in rank, under manifold appellations. In myths the power of light rises to importance only when it is associated with heat, for this is the beneficent power which raises the crops and becomes the nourisher of mankind. In this third edition our author lays but little stress on the myth-making power of light and dawn, contrary to his practice in other publications.

Dr. Brinton was probably the first to apply the term "culture heroes" to certain mythic characters in America; a short list of them is given on page 192, which, he says, could be extended indefinitely. These heroes taught their people the arts of life, religious worship, the secrets of magic; and, by ruling over them, added to their happiness. Brinton thinks that some of them may belong to history, but the descriptions we have of them make this rather doubtful, and we are of opinion that only Hiawatha, of the Iroquois, can be considered in this light even by those who are not euhemerists. These characters are mostly masculine, and we find no culture heroine in America comparable to Demeter of the Greeks.

Where is the seat of the soul in the living body? The medicine-men of all tribes have settled this problem in some way and to their own satisfaction. The Greek term *phrenes* would place it in the midriff, the Hebrew *ruach* in the breath. But in this country most Algonkin tribes had it in the heart, the New England Indians in the brain, the Tonkawēs in the fontanel, and the Costa Ricans in the liver. A plurality of souls is assumed by the majority of Western tribes of the United States, and they were brought to this by philosophizing upon the nature of dreams. The Eskimos even assume the existence of three souls, the last one entering the body when the child is given its name (p. 277).

There was a custom of cleaning, packing, and transferring the bones of the dead when a certain period had elapsed after decease. But this was by no means a *general* custom, as Dr. Brinton assumes, for persons buried in stone cists (Omaha), or in canoes (Columbia River), or trees (Dakota), were certainly left where they were placed first. On the Pacific Coast, cremation was the general mode of disposing of the dead. A motive for preserving the bones was the expectation that the soul would return to the bones (p. 295) and the body be returned to life again. Ancestral worship, which might have been the sequel of this custom, is found in America, but sporadically and not prominently.

Many passages of this work have been left unchanged from the first edition, *e. g.*, what is said about circumcision and about the superstition of the horned snake, which we find among Hurons, Muscogees, and Shawnees. The fact that in the Minitaree language *midi* means *water* and also *moon* cannot be adduced to prove that the moon-deity controlled rain and rain-water, for both words rest upon different radical syllables and are homonyms only. Again, the belief that the human race took its origin in mountains is not infrequent in this part of the world; but from the fact that the Delaware Indians called the Alleghany Mountains "Paemotinck" no argument can be drawn in favor of this opinion, for this name does not mean 'the origin of the Indians.' It simply signifies 'in the distant mountains,' for pām-, pem-, is a prefix pointing to distance, 'far off,' ádn or óden means 'mountain,' and -k is the locative case-suffix, meaning *on*, *in*, *upon*.

Water Supply. (Considered principally from a sanitary standpoint.) By William P. Mason, Professor of Chemistry, Rensselaer Polytechnic Institute. John Wiley & Sons. 1896.

With the spread of sanitary knowledge and the increasing demands of a concentrated civilization, the conditions surrounding the question of water-supply grow in number and importance as health and comfort press for purity and abundance. Almost every locality has its own problem of varying complexity, as, to go no further, is shown in this immediate region by the difficulties of the Schuylkill, the Passaic, and the Croton. The details differ, but the underlying principles, often perplexing to apply, and perhaps not yet recognized in all their bearings, are gradually being assembled as in a depot. From such a treasury those who have the wisdom may draw the appropriate preventives and correctives. One such thesaurus is before us. Prof. Mason has a well-defined place among chemists, and has been recognized by some American hygienists as an intelligent investigator and teacher of the relations of water to man, but the present work will extend his favorable reputation much further.

This volume is not behind the latest genuine achievements of hygiene along its special line. It recognizes that the malarial poison is potable as well as respirable. It accepts as a working hypothesis the possible evolution of the typhoid bacillus from an innocent bacterium, with the inevitable conclusion that fever and filth are intimately related. It teaches that sunlight does and frost does not destroy that special poison; it emphasizes the necessity of intermittence when soil filtration is depended upon to purify water; it insists that when a watershed has once been selected, its immaculateness must be protected with the utmost rigor of the law. It maintains the virtue of boiled drinking-water, which, as a decoction of roots, saved from the malarial poison the Spanish invaders in the swamps of Florida, and preserves to-day the tea-drinking Chinese among the shallow wells of the California plains against that plasmodium, and will protect all others against water-borne cholera and typhoid causes. The value, nay the necessity, of sedimentation and of filtration on a large scale is shown, and the work makes clear what is quite as important to the individual, the mischief that may inhere in the domestic filter. In fact, no artificial filter is self-cleansing, and no natural filter may be overworked with impunity.

Quite beyond the chemical investigation, nature, and treatment of water for ingestion and for economic purposes is the author's meteorological and climatic range. Incidentally he discredits the popular belief that rain generally succeeds great battles because of gunpowder, and quotes Plutarch as describing the field to have been thus mercifully bathed after days of ancient slaughter; while as against the confessed frauds of the explosive rainmakers of to-day, he cites the authority of Arago that a hundred and thirty years ago guns were ineffectually fired to dissipate storms.

The water supply of the great plains, popularly supposed to be derived from the precipitation on the Rocky Mountains, and to lie under them, only awaiting pumping to render those semi-arid grazing-grounds fertile fields of cereals, Prof. Mason believes to be most limited. Deep river-trenches at the eastern foot of the range cut off the most of this from reaching the open country. He quotes Follett in a Senate Document (52d Congress) to the effect that not more can be hoped for from the underlying sheet than enough to irrigate from two to five acres in every farm [of one hundred and sixty acres?], and that if general irrigation is attempted, the water level must be permanently lowered with general consecutive disaster. Of course this is theoretical, not demonstrated science; that is, science not demonstrated on the spot. Its correctness is of vast importance to the potential thousands who, in the eyes of enthusiasts, are to make the great plains blossom as the rose, but it seems probable that the arable soil will remain that within relatively narrow lines along mountain bases and river bottoms. That the lowering of the subterranean water-supply just referred to may occur, and is a serious matter, is inferrible from the change in that from the chalk basin upon which London depends. There, through the valleys of the Colne, of the Lee, and of the Thames, deep wells and superficial streams are showing that three gallons cannot with impunity be drawn from a given area for every two that fall upon it. Another warning that we do not recall elsewhere is against pressing a driven-well system beyond its true capacity. Natural filtration insures pure water; but if the wells are forced unnaturally, the water table is unduly lowered locally, a rapid flow towards the exhausted region may cause subsoil channels, and the way is then opened for unpurified surface water to enter. Such an accident would be irreparable. Faith in the filtering power of the soil or ignorance as to its limitation is almost incredible. An example, not cited in this volume, was, turning superficially upon the galleries a polluted stream and expecting it, by straining downward through three feet of gravelly earth, to swell the potable water. There was an increased volume, and with it a corresponding morbidity and mortality rate. Possibly the water company was more concerned about the amount than the purity of the supply.

One of the appendices, of which there are several, shows the economy and efficiency of using salt water for watering and washing roadways and streets and for flushing sewers,

but not for extinguishing fires. There seems no reason why our seaboard cities might not accept such aid to relieve the drain of this mechanical work upon the usually overtaxed domestic supply.

We may fairly place Mason's 'Water Supply' upon an equal shelf with any book of its kind. It appeals to a large circle of readers, from the consumer to the physician and the engineer, and few can examine it without advantage. It is fully illustrated, and has a copious although not particularly clear index, whose numerous headings, however, counteract an occasional indirectness.

A History of Egypt during the XVIIth and XVIIIth Dynasties. By W. M. Flinders Petrie, D.C.L., LL.D. Charles Scribner's Sons. 1896. 12mo, pp. xvi, 353. $2.25.

ABOUT a year ago the first volume appeared in a series projected by Professor Petrie and intended to embrace the history of Egypt from the earliest times down to the close of the Arabic period. The present volume is the second, but it covers only two of the four dynasties which the original prospectus assigned to it. The reason is that it was found impossible to compress into a volume of the requisite size the wealth of material that lay ready to the author's hand. It is strange that we should be so well instructed as to the sequence of events within a period whose terminal limits are so ill-marked and indefinite in terms of the ordinary reckoning. One is surprised that the "annals" of a king's reign can be written when there is uncertainty as to the decade or even the century when the reign itself began.

The importance of the events detailed in the present volume is great, and the personages described rank with the foremost names in the world's history. The seventeenth Egyptian dynasty is obscure and the facts known about it are meagre; but with the rise of the following dynasty there occurred the expulsion of the Hyksos invaders who had held the land in bondage for upward of five centuries. Then followed the reigns of the three Thothmes, during which the power of Egypt was extended over distant Syria. Intermediate were the maritime ventures of their kinswoman, Queen Hatasu or "Hat-shepsut," which brought the various products of the Somali coast to enrich the temples of the gods at Thebes. Before the close of the dynasty came the nearest approach to a monotheistic worship which Egypt ever knew, under Amenophis IV., the "heretic" king, who himself was under the influence of a Semitic or foreign mother, wife, and household. The worship of the sun-disk as Aten (Adoni or Adonis of the Syrians), however, did not long endure, and coincidently with the fall of the dynasty the old worship of Amon-Ra of Thebes reappeared. The story of this development is wrought out by Prof. Petrie in masterly style, and the wonder is that so much detail is possible after so many intervening centuries. Use has also been made of the facts disclosed by the cuneiform tablets found recently at Tell el-Amarna in Egypt, both to throw light upon the internal and external condition of Egypt at the time, and also upon the geography of Palestine and Syria.

Prof. Petrie is an eminently judicious and painstaking writer, as well as a learned and accurate explorer and archæologist. In this series he is giving to English readers the best history of Egypt that we have in the language, and in fact in any tongue. Numerous illustrations accompany the text, and the printing of the names of kings and princes in hieroglyphic type at the head of the various chapters will be welcomed by advanced readers. The amount of detail embodied in the work is immense, and it would be difficult to find many facts of interest in the history which are not mentioned. Indeed, the series promises to be a thesaurus, and yet the volumes are readable, interesting, and at times even fascinating. It is brought down to date, and cannot but prove valuable to a large circle of readers, both special and general.

The Ecclesiastical Architecture of Scotland, from the Earliest Christian Times to the Seventeenth Century. By David Macgibbon and Thomas Ross. Volume II. Edinburgh: David Douglas. 1896. Pages xx, 564.

THE first volume of this excellent book has been already reviewed in these columns. The present deals with the earlier complete Gothic architecture of Scotland, or that which corresponds to the so-called "Early English," and also with the later architecture which was founded upon English "Decorated" and English "Perpendicular." The epoch represented covers the thirteenth century and the fourteenth century, during which the savage wars with England prevented architectural development, and that part of the fifteenth century during which work began again, much in the spirit of an earlier time. The names given in this book to the styles considered are the sufficiently accurate ones, "First Pointed" and "Middle Pointed."

It is, of course, true that Gothic architecture did not originate in Scotland, nor even in England; and if it is true that the English Gothic is not always perfectly consistent as a style, but shows in many cases a reminiscence of the earlier or pre-Gothic period which it cannot shake off, it is still more evidently true that in Scotland the style never reached a very magnificent development. The buildings were small, the means at the command of the builders were not great. In spite of the intimate political intercourse between France and Scotland during the Middle Ages, the presence of French design seems doubtful, or, at least, rare; and, in short, it is not to Scotland that one would go to study Gothic architecture of the highest type. But as a thorough study of an outlying school of buildings which are full of spirit and sincerity, and which, by great good fortune, have not been ruined by destructive restoration, this volume is to be confidently recommended. It is with the greatest pleasure that one finds in the critical remarks scattered through the book, in the preface and the introductory essays, at pages 1 and 331, a perfectly just and equable tone of historical treatment, as well as a profound familiarity with the subject in hand. It is as evident here as in the earlier volume that our authors know the architecture of the Continent and of England admirably well, and feel with entire rightness the connection between the minor schools of Scotland and those greater and wider developments of the styles.

It appears from the general title that at least one volume is still to be looked for. The ecclesiastical architecture of the Scottish styles contemporaneous with the Tudor, the Elizabethan, and the Jacobean of England will be extremely interesting. We shall hope to learn from that volume how far the Continental architecture of the Renaissance had weight in Scotland; in England such influence is hardly noticeable except in tombs and doorways and similar large details. As to the general design of buildings, the Gothic influence is never absent until, after the civil wars, the sudden classical revival under Inigo Jones and Wren appears, and that ought not to be called Renaissance at all.

Bird Land Echoes. By Charles Conrad Abbott, M.D. With illustrations by William Everett Cram. Philadelphia: J. B. Lippincott Co. 1896. 8vo, pp. 270.

IN telling one of his stories Dr. Abbott remarks (p. 158): "I needed tact, which I am not blessed with, and was lucky to-day in not blundering." Lack of tact may be one reason why so clever and prolific a writer as Dr. Abbott has never been fortunate enough to secure any very general recognition, either in archæology or in ornithology. He certainly blunders throughout the present volume in bumptiousness toward ornithologists, whom he affects to despise, as if the attempts of these "bird-men," as he calls them by way of a sneer, to be technically accurate, were a reflection upon his own methods. Perhaps the comparison is odious to him; but it is not tactful to apologize for himself by slurring others who prefer to be more scientific than he cares to be. Pride of amateurishness can never hope to justify itself by flinging out at professional work; the trick is easy enough, but never successful. We could name a dozen agreeable writers on birds, of considerable attainments in ornithology (yet content to leave the technicalities in abler hands), whose influence and usefulness are directly proportionate to their tactfulness in the single particular we find so offensive in Dr. Abbott's case. We have no quarrel with the amateurs; we leave them to their own devices, wishing them the joy and peace we have no desire to disturb. Dr. Abbott rides his hobby with ease, invests his birds with imaginary attributes from the depths of his own consciousness, and dreams about them pleasantly in print; he turns phrases effectively, and makes good reading-matter for those who find such reading-matter good. But many of his statements of fact are widely at variance with the experiences of other observers. There is an unreality in Dr. Abbott's writing, even where his verisimilitude is obvious, that almost raises a question of veraciousness.

Some of Mr. Cram's slight sketches are much better than others; they have merit, as a whole, and the best ones lead us to believe he could do better still with a little practice in art technique. We are also sure that the author could write a better book than this one if he would take our friendly criticism to heart.

BOOKS OF THE WEEK.

A Library of the World's Best Literature. Vols. 1 and 2. New York: The International Society.
Boutell, L. H. The Life of Roger Sherman. Chicago: A. C. McClurg & Co.
Cyr, Ellen M. The Children's Third Reader. Boston: Ginn & Co. 60c.
Dix, Rev. Morgan. Harriet Starr Cannon, First Mother Superior of the Sisterhood of St. Mary. Longmans, Green & Co. $1.25.
George, A. J. Tennyson's Princess. Boston: D. C. Heath & Co. 90c.
Hoy, Dr. A. H. Eating and Drinking. Chicago: A. C. McClurg & Co. $1.50.
Littell's Living Age. Oct.-Dec., 1896. Boston: *Living Age* Co.
Nestle, Eberhard. Novi Testamenti Graeci Supplementum Editionibus De-Gebhardt-Tischendorfianis. Leipzig: Tauchnitz; New York: Lemcke & Buechner.
Poems and Ballads. By "Q." London: Methuen & Co.
Read, Opie. An Arkansas Planter. Rand, McNally & Co.
Shannon, C. H., and White, J. W. G. The Pageant. 1897. London: Henry & Co.
Tinseau, Léon de. La Lampe de Psyché. W. R. Jenkins. 85c.
Wheeler, E. P. The Duty of the United States to American Citizens in Turkey. F. H. Revell Co.
White, W. A. The Real Issue. Chicago: Way & Williams. $1.25.

The Nation.

NEW YORK, THURSDAY, JANUARY 14, 1897.

The Week.

THE precipitate flight of the Jingo Senators at Secretary Olney's first fire suggests how delightfully they would manage a real war, if they ever happen to blunder into one. But the fact that their performances are ludicrous ought not to blind us to the fact that they are also menacing. We do not mean simply the threat to business and to the national reputation which is involved, but the great shock to our whole fabric of government which their action, if tolerated, portends. This is the view of the matter which the philosophic Paris *Temps* takes. It considers the Cuban resolutions not so much a danger to Spain, or a hope for Cuba, as a peril to our own government. They mark one step more in the usurpation of power by Congress, and the practical reducing of our country to the parliamentary régime, where all power is vested in a single assembly subject to every gust of popular passion. The *Temps* points out how, with a radically different written constitution, we are rapidly approaching the French practice. Our cabinet has no voice, theoretically, yet, in very self-defence, its members are compelled to speak out before committees and in newspaper interviews. What greater effect would Mr. Olney's recent defiance of the Senate and House have had if delivered from the Vice-President's or the Speaker's desk? A French Minister of Foreign Affairs on the tribune could have done no more. And in the eager grasping of the Senate for control of executive functions, what have we but the spirit of the French Chamber greedily absorbing into itself all the powers of the state?

There is a great deal of solemn warning for Americans in these comparisons made by a cool and impartial French critic. We are undoubtedly seeing a temper astir in Congress which leads straight to the obliteration of executive and courts, and, especially in the conduct of foreign affairs, to the destruction of all method or consistency or decency. A large part of the ferocious hostility of Congress to Mr. Cleveland is due to the fact that he has sturdily withstood its overweening pretensions. It does not add cheer to the outlook to be told, even by the warmest friends of his successor, that McKinley is not the man to lift a finger against a majority vote in party or Congress.

The Pacific Railroads funding bill, defeated in the House on Monday, was a complicated financial measure, and it is no great wonder, therefore, that it was beaten. The chances of any complicated financial measure being understood or accepted by Congress seem to be lessening every day. But the motives which were apparently strongest in bringing about the rejection of this bill had little to do with the merits of the question. There was, first, a strong desire to get even with Oakes Ames and a lot of other dead men who made a good deal of money out of the building of the road. Then there was the chance to appear in public as an implacable enemy of corporations and blood-suckers. It was not at all clear how the blood-suckers were to be cut to the heart by the defeat of this bill, but that only made the duty of voting against it more imperative. Blood-suckers are so notoriously sly that you must vote against them even in the dark. Add the general inertia and cowardice of a short session of Congress on the eve of a new administration, and the main reasons for the defeat of the bill will have been enumerated.

Meanwhile the real crisis in the relations of the Government to the roads is left more acute than ever. The debt of the road to the Government is $112,000,000, and is secured only by a second mortgage on the main line. Ahead of this comes a first mortgage on the main line and branches. If the proposition to fund is not accepted, foreclosure would appear to be the only alternative. But this would imply, in the first place, a large issue of bonds—$60,000,000, Congressman Grosvenor said—to pay off the first mortgage, and, in the second place, Government ownership and operation of the road. But we all know how very bad it is to issue bonds, and we can guess how bad it would be for the Government to run a railroad. It is perfectly certain that every prominent constituent would have to have a pass and a position on the road for his son and get his freight carried free. Congress can seriously contemplate neither bond issues on account of the road nor its operation by the Government. The only inference is that it has shirked, and means to go on shirking, its duty to settle the question one way or another. It is the same old policy of drift. Drifting is good fun and very easy, but in the end the ship goes to smash on the rocks. However, you may always hope to be dead and well out of it first.

The speech made by Mr. Brosius of Pennsylvania in favor of the merit system in the civil service of the United States before the holiday recess is published in the *Congressional Record* of January 5. It is one of the best that have ever been made on the subject. It gives Mr. Brosius a high rank both as a statesman and a debater. Naturally such a speech could not be made without provoking controversy and calling up some past wranglings on the practical execution of the law. Thus, the merits and demerits of the first Cleveland administration and of the Harrison administration were pretty fully discussed by Mr. McMillin, Mr. Henderson, Mr. Baker, and others, including Mr. Brosius himself. In the running debate, certain members took occasion to insinuate that, in their belief, the civil-service examinations were conducted in an unfair way. Mr. Anderson of Tennessee wanted to know what was the use of having the special agents of the Land Office examined in arithmetic, algebra, and geometry. Mr. Brosius replied that the examinations were in every case prepared with reference to the work to be done and were not scholastic, technical, or bookish. Mr. Anderson then asked if the Commissioner of the General Land Office could not "talk to these gentlemen in his office, and in a few minutes find out their qualifications much better than through one of these examinations—I will not say one of these absurd examinations—one of these civil-service examinations? In other words, he knows the kind of work in which they are to be engaged." It is evident that Mr. Anderson's idea of "civil service" is as hazy as that of our Gov. Black.

Gov. Black's message is on most subjects sensible, if a little youthful. What he says about prisons, banking, insurance, labor, agriculture, the insane, education, and the excise law would be denied by none but the recreant and the vile. He is equally sound about the forests, and Greater New York, and biennial sessions. The only subject on which the old Adam appears to rise within him is the reform of the civil service. On this subject he falls into the comic error, not uncommon among politicians, of saying "civil service" when he means civil-service reform, or appointment by examination. The Governor of a great State acknowledging "the value of practical civil service" sounds very like saying that a man without hands makes a poor watchmaker. What he means is that competitive examinations for appointment to the civil service may be valuable. But in what way the civil service of the State "provides capital for many who would otherwise be bankrupt" is to us unknown. It is probably one of the Governor's state secrets. He evidently knows no more about the system now in operation than the Progressive Gruber or the Trojan Van Allen. He is evidently possessed by the Gruber idea that the examinations now made are literary, and have little or no reference to the duties of the office. Nor do we understand how "civil service" works with or without "starch."

This appears to be a bit of slang of a Troy politician, and should not have found place in a state paper. The only remedy for these obscure passages is information. The Governor should have examined the present system before writing his message, which he evidently has not done.

He calls on the Legislature to make the civil service "secure for the public; at a reasonable cost, unquestioned integrity and approved skill," etc., which is simply the usual politician's way of saying that he wishes the Legislature to let men in office "have the men they want." But we must warn him that the Legislature cannot do what it pleases in the matter. The constitutional amendment has put the "civil service" under the protection of the courts, which have decided that appointments must be made by examination, and that the examination must be competitive "so far as practicable," and it appears all but certain that the courts, and not any executive officer, will decide whether in any given case a competitive examination is practicable or not. One of the delusions under which politicians labored, at first, was that they could say themselves when an examination of any kind was necessary, and whether any examination needed to be competitive. If they had this discretion, of course, the constitutional amendment would seldom or never be put in force, and would be practically worthless. They were waked up from this by the Court of Appeals in the Aldridge case, and have ever since been rubbing their eyes and yawning, and wondering to each other whether there was no way out of this wretched business. Gov. Black seems to be still in bed on this subject.

A very striking demonstration of the real sentiment of the Republicans of the State upon the senatorship question has been made by the Buffalo *Express*. It published on Saturday about two solid pages of names of Republican voters of Erie County, over 4,000 in all, who voluntarily declared their preference for Mr. Choate for Senator. These were sent to the newspaper on postal cards within a single week, and without special effort to attract them. Gov. Black had in Erie County only 8,000 majority, so that these 4,000 voters, if they were to change to the opposite party, would completely wipe out that majority. They give their names fearlessly, and their conduct may possibly have some effect upon the Senators and Assemblymen of the county who are proposing to vote for Platt. Unquestionably they represent the views of many other Republicans who do not make public protest, and who will be heard from when the time comes to choose new Senators and Assemblymen again. There is probably no county in the State in which a canvass would not reveal a similar condition of affairs. Does anybody doubt that a canvass of this city, for example, would show an overwhelming majority of Republicans in favor of Mr. Choate? Would Mr. Platt consent to go before the people of the State as a candidate for any elective office? His dummies wished to nominate him for Governor last fall, but he would not listen to the proposition for a moment. His strength consists entirely in his ownership of the machine and of the men whom he has bought, and nobody knows this better than he.

It is the confident expectation of the Platt Republicans who are proposing to "jam through" the Legislature at this session the proposed charter for Greater New York, that they will be able to elect the first Mayor and first Municipal Assembly of the enlarged city and get possession of all the offices and patronage. They base this expectation on the vote of the various sections of the enlarged city at the election in November, which showed a plurality of 59,000 for McKinley. Taking these sections separately, and contrasting the plurality which each gave for McKinley with the plurality which each gave for Cleveland four years earlier, the following striking exhibit is made:

1896.		1892.	
New York.....	20,700	New York.....	76,000
Brooklyn.....	32,000	Brooklyn..... ...	30,000
Queens Co. towns..	3,500	Queens Co. towns .	3,300
Staten Island	1,700	Staten Island	2 000
Westchester towns	1,100	Westchester towns	1,600
Total Rep. plu...	59,000	Total Dem. plu..	112 900

This is far from being a "sure Republican" basis upon which to claim the new city. It should be borne in mind that McKinley's vote in this territory was much larger than Black's; the latter's total plurality within it being only 34,000, or 26,000 less than McKinley's. If now the Republicans put through the Legislature a charter which provides a thoroughly partisan scheme of government for the new city, what will be the first effect? Will it not be to drive back into the Democratic party all those sound-money Democrats who voted for McKinley last year? What would become of the 59,000 McKinley plurality then? It would be all lost in the present New York city if the Democrats here were to combine upon a harmony ticket. The 32,000 in Brooklyn would disappear there instantly if the Shepard Democrats were to unite with the regulars. There is in both these cities a natural Democratic majority which has never been overcome except either when the Democrats were divided, or when thousands of them consented to support an independent or citizens' ticket.

The Ohio wool-growers are again in Washington, headed by the same spokesman and making demands even more exorbitant than before. They say distinctly that the McKinley tariff was not high enough for them. That tariff gave them twelve cents a pound on clothing wool. Now they want fifteen. They want double this rate on Australian wools, to be brought about by classing all such wools as washed whether they are actually washed or not. They want other cunning provisions in reference to "skirted" wools which amount to prohibition of certain kinds of wool. Chairman Dingley asked Judge Lawrence whether any Australian wool would be brought into the country at the rates of duty proposed by him. The Judge thought there would be some, but he considered Australian wool a luxury, and thought that it ought to be subjected to a luxurious rate of duty. Even if it were wholly excluded, he said that that would be a good thing, because we paid gold for Australian wool, whereas we paid for South American wool with our products. He was asked how we should get any revenue from the duties on wool if wool were excluded, and he replied naïvely: "Why should we want any—I mean from wool? The country will be prosperous and we can get revenue from other sources." This is a conception of tariff theory which every class and interest is equally entitled to advance. If it were carried into effect, all foreign trade would be prohibited except in articles which cannot be produced in this country, such as coffee, spices, raw silk, etc., which might be made to yield $50,000,000, all the rest of the revenue being raised by internal taxation.

Senator Proctor of Vermont made a long speech on Monday in support of two amendments to the Constitution, one of which would extend the term of the President to six years and prohibit his reëlection, and the other would make the term of Representatives three years. There is one fatal objection to extending the tenure of the Executive. It is always possible that a man who was never thought of for President, and who would never have been nominated for President, may as Vice-President succeed to the office. This has happened four times within the last fifty-six years, and in three of the cases during the first few months of the term. Extend the term to six years, and we may have the White House filled for five years and eleven months of the period by a man whom the country would never have elected as President. The risks of the present system are too great to be further increased. Senator Proctor's chief argument for a change in the Representatives' term is that we now have one long session and one short, and that the first is hardly concluded before members come up for reëlection. This is a great evil, but the way to end it is not by extending the term of the Representatives. The change that is needed is one which will convene Congress in the January following an election of Representatives, and enable two long sessions to be held before the next election.

No two authorities yet agree as to the vote received by the various candidates for President at the November election. The *Tribune Almanac* makes McKinley's total 7,105,729, and the aggregate for Bryan and Sewall and Bryan and Watson 6,491,977. The *Herald* on Monday published figures from the various Secretaries of State, which make the respective totals 7,121,342 and 6,502,600. Only thirteen of the forty-five States had a Bryan and Watson ticket, and in only three of these thirteen did it secure any considerable part of the anti-McKinley strength—namely, Massachusetts, where there were 90,530 Sewall votes and 15,181 for Watson; Alabama, 107,137 for Sewall, and 24,089 for Watson; and Texas, where the "Middle-of-the-Road" men polled 76,926 for Watson as Bryan's associate, against 284,298 for Bryan and Sewall. In all, the *Herald* figures up 144,928 votes for the Watson ticket, 123,428 for the regular Prohibitionist candidate, 13,535 for the "National" party started by a faction of Prohibitionists, and 35,306 for the Socialist-Labor ticket.

The plurality for McKinley over Bryan's total on his two tickets is 618,742. In comparing the last election with previous ones, however, the fact should not be overlooked that women voted for President in November for the first time in both Colorado and Utah, and contributed nearly half of the 134,990 plurality for Bryan in Colorado and 50,986 in Utah; the excess of males in each State being slight. On the basis of previous contests, therefore, McKinley's plurality would be about 700,000. This is not so much as was claimed by Republicans immediately after the election, but it is really more impressive than the larger plurality of 763,007 for Grant over Greeley in 1872. In that year the Republicans still controlled the count in most of the Southern States, and gave Grant such majorities as 50,000 in South Carolina and 35,000 in Mississippi. In the great Northern States between the Hudson River and the Mississippi, Bryan as a rule was beaten far more badly than Greeley—by 268,325 in New York, for example, as against 53,455 in 1872; 295,072 in Pennsylvania, as compared with 137,548; 141,517 in Illinois, against 57,006; and 102,612 in Wisconsin, against 18,520. Indiana and Michigan are the only States in all this section which fell behind the record of 1872.

An extraordinary complaint comes from New Hampshire—that the Legislature which has just assembled has not lawyers enough to fill the places on committees that require the services of members of the bar. There are but three lawyers among the twenty-four members of the Senate and only nine among the 357 Representatives, whereas it has been customary to place ten or eleven lawyers upon the judiciary committee of the House, and they have also been thought necessary upon the committee on revision of the statutes and as chairmen of the elections committee. Except in the cases of two or three Populist Legislatures, where the prejudice of that party against the legal profession found expression, we do not recall an instance where a complaint of the dearth of lawyers in such a body has been heard. The usual complaint of the farmer is that there are too many lawyers. It seems that the present situation in New Hampshire is only the culmination of a tendency which has been observed for some years. One reason is that the sessions come at a time when courts are held in some counties, and work must be prepared for courts that sit later in other counties, so that lawyers with plenty of business are not inclined to give the time to legislative service that is required. Constituencies are also less disposed now than formerly to reëlect a member, and the average lawyer is less tempted to go to the Legislature when he can generally expect to serve only a single term.

Sir William Harcourt's last budget revealed great national prosperity, but it is thought that Sir Michael Hicks-Beach's first budget will surpass it. From the returns now in for nine months of the fiscal year, it is figured that the revenue will exceed the estimates by from $10,000,000 to $12,500,000. Almost every item outruns anticipations—customs, excise, stamps, death duties, income tax—which is the surest proof of widespread prosperity. The Board of Trade returns for 1896 and the accounts of Christmas shopping have the same tale to tell. As usual, the thick-headed English are rejoicing that their imports so largely outstrip their exports. It is really painful to see a great nation, in an age that has produced a McKinley and a Méline, given over to the strong delusion that having and enjoying the good things of life is better than selling them to somebody else to enjoy. No wonder that such a belated and benighted people cling to the gold standard and free trade.

The agitation in Ireland over the report of the Commissioners on Taxation, showing that Ireland is overtaxed, in comparison with England and Scotland, about $12,500,000, promises to make Irish questions stand in the way of all other legislation in the next session of Parliament. The *Times* and some other English newspapers meet the matter in rather a savage anti-Irish spirit which only adds fuel to the flame, while even the high Tory Irish papers, such as the *Evening Mail* in Dublin, have gone over to the enemy. The Unionists and Home-Rulers have, in fact, joined forces, and stand together on platforms all over the country, as laborers in a common cause; such men as Smith Barry, the demon landlord, standing shoulder to shoulder with the demon Home-Ruler, "Tim" Healy. The English answer is simply that the Irish are overtaxed because they drink too much whiskey; to which the Irish reply that they will drink as much whiskey as they please, and that if they drink more whiskey than the English, they drink less beer, and that even if their taxes were equal, it is unfair to make them, a poor people, pay the expense of keeping up a gorgeous empire which they neither desire nor admire. The English reply that Ireland cannot be treated as a "separate entity"; to which the Irish rejoin with a large number of cases in which Ireland is treated as a separate entity by the imperial Parliament, notably in the matter of coercion. None of the coercion bills have applied to England or Scotland, and Ireland is not allowed, as other parts of the kingdom are, to have her say regarding her local legislation. To this the English rejoin that the Irish never unite till they see a chance of getting hold of some of John Bull's money; so that general recrimination is not far off. The difficulty of the situation for the Government is that "the English garrison," on whose behalf mainly the Conservatives said they opposed home rule, has turned against them—something which has not occurred since the Union. This alliance is undoubtedly an excellent thing for Ireland, but is full of embarrassment for the Ministry, and they may easily aggravate its consequences by too acrid or contemptuous a tone. On this subject the Irish will command 105 votes, the like of which has never been seen. The last time the English garrison revolted was in 1782, but there were no Catholic voters or representatives.

A recent trial in France brought to light some curious details of the capital that may be made in attacking capital, and of the good things that even a corrupt and bourgeois society may afford to its fiercest denouncer and enemy. It was a suit in which the profits of Rochefort from the *Intransigeant*, in the seven years 1889-1896, were put in evidence. When he went to Belgium with Boulanger in 1889, he left his paper in charge of M. Vaughan, with whom he has since quarrelled, and who has sued him for services rendered. An accounting was demanded, and from it it appears that Rochefort in the seven years mentioned received a salary of $20,000 a year, besides dividends amounting all told to $200,000 more—or nearly $50,000 a year. This was not bad for a paper black in the face every day over the injustice and oppression of a bourgeois society. However, Rochefort will have more reason than ever to think badly of a bourgeois society since a bourgeois tribunal has condemned him to pay a good round sum to the employees whom he was proposing to cheat.

THE ARBITRATION TREATY.

THE fact that a treaty of general arbitration between this country and Great Britain had been negotiated and was nearly ready for final signature, was made known some weeks since, and was received with lively satisfaction by the press and public on both sides of the water, and without a single dissenting voice, so far as our observation goes. The text of the treaty, which is now published, confirms all that was expected of it, and encourages the belief that it will soon be ratified. The only note of discord that has been heard thus far is that of an ultra-Tory organ of small circulation in London. The English press generally gives hearty approval to the treaty, and in this respect is in entire accord with that of the United States so far as it has been heard from. The next question is whether our Senate will ratify it by the requisite two-thirds majority. We do not share the doubts that have been expressed on this point, for although the present Senate has shown itself extremely nervous on the subject of foreign relations, it has always been in reference to some particular thing, not to things in general. It is true that, as to Cuba and Venezuela, it has been more touchy than was needful, but that does not imply that it is opposed to arbitration, either in the abstract or in the concrete. This is the same Senate in the main that agreed to the Bering Sea arbitration, and this fact carries a good deal of assurance to the friends of the treaty. It was discovered, moreover, when the great arbitration conference was held in Washington last April, that the Senators were then favorably impressed with the project, and many of those whose attitude had been considered doubtful were inclined to give it their support. It is safe to assume that if public opinion throughout the country is as favorable to the treaty now as it was at the time when the conference was held, ratification will speedily follow.

Whether the treaty be ratified or not, the moral effect of it cannot be lost, and it is moral effect mostly that is sought for in the effort to bring it about. It puts off the motives leading to war. It accustoms the public mind to forbearance, moderation, discussion, negotiation. It causes waiting, and waiting is almost always promotive of peace. It teaches the public to expect peace rather than war, and to exhaust peaceful methods before resorting to war. When we look back upon all the bloodshed that has smeared the pages of history, at the misery and destruction that have checked the march of civilization and put a stigma upon religion itself, we must welcome as a priceless blessing the very smallest gain to the cause of peace. So we are bound to consider this treaty, even if we can imagine its rejection by the Senate, as one of the greatest triumphs of the century that is now closing—a triumph which ought to immortalize every man who has had, or shall yet have, a hand in bringing it about. If it should be rejected now, the work of resuscitation would begin again at once, and the only difference would be that the honor of carrying it into effect would belong to others.

The details of the treaty are not substantially different from those heretofore published. The fixed term of the treaty is five years. At the expiration of that time either party may withdraw by giving twelve months' notice. The promoters of the treaty did not contemplate so short a term of duration, but they will undoubtedly conclude that it is a great gain to secure any treaty which provides for arbitration before the case for arbitration arises. The greatest difficulty they had to meet was the opposition of those who said that the whole scheme was impracticable. These opposers on both sides of the water were good men and good lawyers. They were men of experience in political science, and as patriotic as anybody, and if they had not been met by those of equal learning and experience, the movement could not have succeeded at all. The result shows once more that where there is a will there is a way. It is true that the treaty has yet to be subjected to the test of experience, but it is now proved that a working plan can be put on paper that gives every promise of satisfactory results. And here it may be observed again that the main object in view is the determination of the public mind towards arbitration. This is an end in itself much more important than any single adjustment, since, as Mr. Lincoln once said, "without public opinion nothing can succeed; with it nothing can fail."

Whatever else may be said for or against the work in hand, the highest praise must be awarded to Mr. Olney and Sir Julian Pauncefote for their admirable grasp of the subject they had to deal with, and for the concise and lucid embodiment of the ideas which they had to express. Not even our Declaration of Independence, Jefferson's masterpiece in composition, surpasses the treaty in clearness of diction. To this achievement must have contributed the fortunate elimination of "national honor" as an obstructive proviso.

SPREAD OF THE MACHINE.

NEW YORK, Pennsylvania, and Illinois are the three largest States in the Union. All three were carried by the Republicans in the November election by overwhelming majorities. All three are to elect United States Senators this month, and the Republican legislators, who have the choice, held caucuses last week which either settled or clearly foreshadowed the result. In all three cases it was demonstrated that a machine absolutely controls the dominant party, and so rules the State.

The Republican caucus at Albany was nothing more than a meeting to record the decisions, as to the speakership and other offices, reached by Boss Platt in this city. Platt's organ in the press, the *Sun*, openly proclaims this fact. "The places at the disposal of the caucus," says its Albany dispatch, "had been portioned out weeks and months ago, and the session to-night was a mere formality to register the decrees already made."

The Republican caucus at Harrisburg settled the question of the senatorship by nominating as Quay's colleague Quay's man, a young Philadelphia lawyer, by a vote of nearly two to one. The business men of Philadelphia, who so often have raised corruption funds for Quay to handle in political campaigns, turned against him this time and supported Wanamaker; but they had made the monarch of the commonwealth too strong to be dethroned. The situation was clearly portrayed by Mr. Wanamaker on the eve of his defeat, when he said: "It seems as if a lease to Pennsylvania had been handed over by some one, as if it were a lease to a farm that carried with it a million of voters as if they were Irish tenants."

At Springfield the one question was whether what is known as "the State machine" can control the Legislature and elect Madden, the "boodle Alderman" of Chicago, as United States Senator. The test was to come over the nomination of Speaker in the Republican caucus. The machine devised a very shrewd scheme. Schubert, a German member from Chicago, was put forward as its nominal choice, with Curtis, a rural Representative, as its real man, whom it could bring to the front after the expected and inevitable revolt of the countrymen against letting Chicago "hog everything." The plan worked exactly as had been arranged. Governor-elect Tanner threw all his influence in favor of Curtis, and easily carried the caucus. The new Governor will now use the State patronage in behalf of the machine candidate for Senator, and no doubt of Madden's election is any longer entertained.

The Platt and Quay machines are familiar to the country. The Illinois machine is a new product in a State which has never before been thus ruled, and is consequently a subject worthy of national study. It had its origin in the city of Chicago. Something over two years ago several ward politicians, who had been active but never prominent workers in the Republican party, conceived the idea of forming an offensive and defensive office-getting "combine," to seize and parcel out all the local offices worth having, without fighting over them and struggling to snatch them from one another. This close corporation came to be known as "the 12:45 club," from the agreement of its members to meet at the lunch hour and work up their schemes. The "combine" was formed at a peculiarly favora-

ble time, when a Republican tidal wave was seen to be sweeping over the country. It consequently had little difficulty in electing the "slate" which it carried through the county convention of 1894. The next year the 12:45 club secured control of the Republican county central committee, which meant the power to boss the primaries, select delegates, dominate conventions, and dictate candidates. This put the combination in a position where it could lay hands on all the county offices, members of the Legislature, and other places to be filled in 1896, although, to prevent possibility of any trouble, the county convention was called early in the spring, when nobody was prepared for it, instead of being postponed until autumn, according to all the precedents.

Meanwhile, the Chicago managers had been cementing an alliance with various prominent Republican politicians in other parts of Illinois, by which State offices were to be disposed of for the common interest. Tanner was picked out as the candidate for Governor—a man so bad that the Chicago *Times-Herald*, which supported McKinley, could not urge its readers to vote for him, even in preference to Altgeld. Other choice positions, local and State, were apportioned among the members of the ring, until only the United States senatorship remained to be disposed of. This was assigned to an illiterate and corrupt ward politician of Chicago, on the ground that he "must have something," and that this was the only thing left to give him!

Many of the nominations made by the machine were unsatisfactory to the better class of Republicans, but the overshadowing issue of Bryanism carried them through. During the canvass nothing was said openly about the senatorship, but soon after the election the machine announced Madden as its choice. An earnest protest was at once raised by self-respecting Republicans, but the ring has not seemed much disturbed. It had nominated and elected its men; it believed that it could depend upon them, and last week's caucus justified its confidence. With a delicate consideration for sensitive members, it has been arranged that the vote for Senator in the Republican caucus for that officer shall be taken secretly, so that any rural member who dreads the condemnation of his constituents for carrying out his bargain with the ring may conceal his action.

The now apparently assured election of Madden to the Senate means the instalment in absolute power in Chicago and Illinois of a Republican machine as bad as anything ever known in New York city and State. The Chicago *Tribune*, which has been exposing the development of the plot, says of its success:

"The election of Madden for United States Senator will signify the creation of a Chicago Tammany to boss the city and State with Republican leaders and Democratic auxiliaries, which will dictate the Legislature as absolutely and before long as corruptly as a dishonest combination of Republican and Democratic Aldermen has bossed the Council and despoiled the city."

The machine is thus supreme in the three greatest States of the Union. It is exhibiting alarming power in many other States. It gives the country Platt as Senator from New York; Quay's man from Pennsylvania; a Chicago "boodle Alderman" from Illinois. Having done this, it asks the people, "What are you going to do about it?" Unless that question shall be effectively answered, democratic government as it was conceived by the framers of the Constitution will have ceased to exist in the United States.

THE CHARTER.

THE action of the Chamber of Commerce on Thursday in regard to the proposed charter for Greater New York is a welcome sign that the people of this city are awaking to the great importance of this question. It would be an astonishing thing if Platt and Lauterbach and Lexow and O'Grady were to be permitted to have their way in this matter, while the genuine citizens of the metropolis remained in too great indifference even to utter a request for reasonable consideration. That such consideration has not been granted, and was not intended from the first to be granted, we have pointed out many times. Mr. Hewitt's excellent statement of the case in his speech before the Chamber made this point more clear than ever. He showed, in words which ought to sting the self-respect of the people of the city into a vigorous and effective assertion of itself, how abject our condition is. We are given no voice in the adoption of a new government for our city. We are informed that the charter will be "jammed through" in the form in which it suits Platt, and that protests from any other source will not be heeded.

What need is there of passing a charter this winter? Does anybody know of any one except the Platt politicians who favors such speedy passage? Why can we not have more time for its consideration, and why can we not be allowed to have it submitted to the people for adoption after its completion? There is only one reason, and that is because Platt has decided that we must have a new government adopted before the election this fall. It was Platt who decided that we must have a charter prepared by a commission, rather than by a convention, and it was Platt who decided that the work must be done within a few months. From first to last the people of the city have been permitted to have no voice in the matter. It is entirely consistent, therefore, that they are to be permitted no voice in its final adoption, but are to take whatever Platt orders his Legislature to give them. The hearings, with their limitation of twenty minutes for each speaker, and a total of only twelve days, for all branches of the subject, begun before the full charter has been laid before the public, are, as Mr. Hewitt says, an absurdity. This is not discussion or consideration, and it is not surprising that so few persons consent to dignify the proceedings by taking part in them.

We had a speedy confirmation of Mr. Hewitt's view in the announcement that, at a secret session on Thursday, the Commission decided to cut down the number of its proposed Municipal Assembly from 141 to 89, and to change the method of electing the 60 members of the lower house by going back to the present system of choosing them from Assembly districts. So far as they reduce the numbers of the proposed Legislature the changes are an improvement, but the reversion to the present district method cuts off all hope of change for the better in the character of the Aldermen. The new lower house would simply be the present Boards of Aldermen of New York and Brooklyn consolidated, and what kind of a body that would give us we can all imagine. The idea that better government could be looked for from such a body is absurd. As it stands, the proposed Municipal Assembly is not a particle less objectionable than it was before. It is still large enough to be irresponsible, there is nothing gained by having it divided into two houses, and the district method of election cuts off all hope of improvement in its personnel. In view of its present composition, the plea that it would be a useful school for education in the science of government becomes positively grotesque. Who ever heard of a useful public servant coming up through our Board of Aldermen? Occasionally some respectable man has got in there, but he has been an educated man before he entered. No uneducated man has ever obtained there any training except in political trickery and crime. As a Chicago Alderman said recently of his associates, "The only learning a Chicago Alderman has needed, of late, is to know where the man is who had the 'stuff.'" That is the kind of school in the science of government which the district system of electing local legislators collects for us.

There are two ways of criticising the charter scheme. One is to look at it as a piece of abstract constitution-making like those in which the Abbé Sieyès used to indulge, or under which such communities as Spanish-American republics live to-day—that is, a charter for a model city like Glasgow or Birmingham, in which the more intelligent classes still rule, in which offices exist for the public service only, in which the tenure is permanent, and popular attention is confined at municipal elections to municipal affairs, and in which bosses, in our sense of the term, have never been heard of, and are indeed hardly conceivable. The other is to consider first of all the special needs, dangers, and necessities of the community for which the constitution is framed, as indicated by the character of the popula-

tion, by its established political manners, and by its political experience, if it has any experience.

Judged in the first way, there is really very little to be said against the charter. Messrs. Dillon, Low, Tracy, and De Witt have produced a very creditable piece of work. The ideal city ought to have just such an Assembly, such a Mayor, and such a Board of Improvements as these gentlemen propose. No lawgiver of modern times could have done much better if he had labored as these gentlemen have labored, *in vacuo*—that is, without reference to the existing conditions or requirements of any particular city. Approaching the charter in the other way, one reads the report of the committee almost with astonishment. We hold it to be the first virtue and first necessity of a constitution, framed for a particular community, to take into account the peculiarities or weaknesses of that community, as revealed by its past history. The organic law is meant to supply the special needs, not of any collection of good and wise men, but of that particular city. Accordingly, in looking into the history of New York for the last thirty years—that is, ever since it began to assume a metropolitan character—we find that what it has suffered from most of all, over and above the ignorance and shortsightedness of large numbers of its people, is, first, the fact that the city has been a football between the two great federal parties; the fact that the Mayors, Comptrollers, and Aldermen have been elected, not because of their fitness, but because of their opinions about reconstruction, the tariff, or Hawaii; the fact that the State Legislature at Albany has interfered frequently to make its franchises, offices and property useful in federal contests to the party commanding a majority; the fact that the voters have had a tendency to consider public places, not as instruments of public comfort and convenience, but as rewards for political activity to which men of the lowest character and most sordid motives may fairly become entitled.

These things were fully described in the report of the Tilden Commission in 1877, drawn in the main by Mr. James C. Carter. That Commission sought in its way, possibly a futile way, to provide for them. Since then a large number of enlightened citizens have labored with more experience and greater light, aided powerfully by the revelations of the Lexow committee, to turn the thoughts of the New York people to the true remedy for their woes and shortcomings—the resolute exclusion of all federal questions from the administration of their municipal affairs; the election of all officers on purely municipal grounds; and steady resistance to the interference of the Albany Legislature with their concerns for federal party purposes, and to the control of their government in any degree by outside politicians under the name of "bosses."

We have looked through the report of the committee in vain for any allusion to the evils from which the city is suffering and has suffered, or to the probability that these evils will reproduce themselves, on a still larger scale and with more mischief, in the Greater New York. The community is treated as virgin soil which simply needs cultivation in his own fashion by a Solon or a Minos. Nay, more; far from discouraging the party spirit in the conduct of city affairs, which has given us a succession of bosses, a foul and debauched police, an ignorant and corrupt Board of Education, a degraded magisterial bench, and dirty streets, it actually makes provision for its preservation and even promotion. The following passage is, in view of the facts of our case, very surprising:

> "The sentiment is indeed growing which tends to persuade the population of our American cities to vote at municipal elections on city issues, rather than on State or national issues. Nevertheless, the great body of the American people still go to the polls in cities on election day animated by partisan sentiments. Habits are slowly changed, whether by individuals or by communities, and it must be inferred that the political habits of the American electors in this particular will yield only slowly to the discipline and instruction of events."

So, in order to change the habits of the "American elector" and give him "the discipline and instruction of events," the commission provides for the election of an Assembly first of 141 salaried members and now of 89, to hold office for two years without the slightest protection against change or abolition (for political reasons) at the hands of the Albany Legislature, armed with no powers for which there is any apparent necessity, or which can have any effect but to furnish more places for the reigning boss to fill, to stimulate the unhappy feeling of the importance of federal opinions in city affairs, and to make every district a focus of low and debasing intrigue for purely federal-party purposes. "It ought to attract men of the highest character and intelligence," says the report. "Ought" is good. Will it? is the question which every man of sense and intelligence will ask himself, and which the committee ought to have asked themselves and answered. This remarkable supposition, too, is produced at a moment when the Legislature at Albany, the superior body, is absolutely "owned" by the boss for the time being, when he can by a wave of his hand prohibit or promote any species of legislation, can send any one he pleases to the United States Senate, and is at this moment rejecting for that office one of our foremost citizens in favor of a silent, corrupt, and ignorant demagogue. No wonder Tammany is in favor of a charter; no wonder that Croker has gone over to Brooklyn to lay his plans for the future with McLaughlin; no wonder Lauterbach has appeared as a "machine man" at the "hearing" to support it; and no wonder that Platt proposes to "jam it through." But where are the old-fashioned Americans?

THE ARMENIAN HORROR.

Mr. James Bryce has annexed to the new edition of his volume, 'Transcaucasia and Ararat,' just published by Macmillan, a supplementary chapter entitled "Twenty Years of the Armenian Question." This is an historical sketch of the relations of the Armenians of Asia Minor to the Turkish Government, and of their treatment by it since his last visit to their country in 1877. It has the great merit of containing as correct a narrative as we can procure of the recent troubles, largely compiled from official sources, by one who was a member of the British cabinet during some of these years.

His story is that the Armenians, barring more or less robbery by the Kurds, the wild tribes who live on their frontier, enjoyed as much piece and security as any other Christians in Turkey until the Russian war in 1877 consequent on the "Bulgarian atrocities," and the interference of England for the protection of Turkey against Russia. This intervention of England, followed by the Anglo-Turkish treaty, in which she constituted herself the special protector of the Christians, and the loss of the greater part of his European dominions, made the Sultan uneasy, and excited great hopes among the Armenians of a change in their condition. These feelings were increased by the appointment of military British consuls in many parts of Asia Minor. England was expected to occupy herself seriously with the sufferings and disabilities of the Christians. She for a time appeared to do so, and made a good many protests and remonstrances on their behalf. These protests and remonstrances produced, after a while, no effect, and finally ceased. The Sultan, finding they had ceased, and hearing more and more of the formation of revolutionary Armenian committees abroad, became sterner and more determined in his attitude towards his Armenian subjects. The Kurds were allowed to rob with more impunity, and the judges in all cases became more hostile. It was well known in Mussulman official circles that the Sultan was in this state of mind and had resolved on severe measures. The saying of a Turkish Minister, that "the way to get rid of the Armenian question was to get rid of the Armenians," was said to have been adopted as the policy of the Government. But all the British consuls reported that the Christian population in Armenia was quiet and patient, and that there was no sign among them of revolutionary purposes, though more and more persons were accused of such purposes, thrown into prison, and even tortured.

To make a long story short, in 1894, on the pretence that some districts were resisting the payment of their taxes, a large body of regular Turkish troops was sent to punish them for insubordination in the usual Turkish fashion—by wholesale massacre of men, women, and children. The British Consul estimated

the number of those who were killed at 900. Other well-informed persons put it at 1,500. There were, as usual, fruitless British remonstrances, and for a year nothing happened. Finding he had nothing to fear from the European Powers, the Sultan resumed the massacres in September, 1895, and sixteen in different places occurred before the end of the year. All Armenians of all sexes and ages were slaughtered or burnt alive in their dwellings, and the women frequently violated. That these massacres were executed by superior order and were not outbursts of religious fanaticism, Mr. Bryce concludes from the fact that regular troops were engaged in them, that they ceased immediately on the receipt of orders to that effect, and that all foreigners were scrupulously respected wherever known. The evidence connecting the Government with them is summed up in a powerful volume by Dr. Lepsius of Berlin, entitled 'Armenien und Europa.' The British Ambassador, writing in January, 1896, put the known number of the slain down at 25,000, excluding massacres of which no details had reached him. Dr. Lepsius estimated the whole number up to June, 1896, at 85,000.

Mr. Bryce, speaking in a recent address at Aberdeen of what Great Britain might have done, said:

"The apologists of the Government tell us, by way of excuse for the submissive inaction of Britain, that her independent action would provoke a European war. No person of weight or experience has, so far as I know, yet suggested that we should do anything which would provoke a European war. Such a war would be a dire calamity, and it would not save the Armenians, who would be the first to perish if a European war broke out. But it has never yet been shown that a European war need have followed independent action by Britain. What I have recently learned, from sources at Constantinople quite as well informed as any one here can be, convinces me that the British fleet might with safety to itself, and without risk of war, have been sent to Constantinople in November, 1895, just after the first massacre, and that its appearance then would have stopped the massacres which in fact followed. The Turkish forts, such as they are, were not then prepared, nor would any other Power have deemed our action, when its disinterested motives had been explained, a *casus belli*."

He further pointed out that Lord Salisbury paid no attention to the suggestions made to him that there were places outside the Dardanelles in which the Sultan might be coerced, and that the American Minister might very well have made the loss and sufferings of the American missionaries a reason for threatening the Sultan in a way that would have incidentally helped the Christians generally; but he proved "unequal to the occasion." In other words, he was more interested in being a *persona grata* at the Yildiz Kiosk than in helping Christians. To the American missionaries themselves Mr. Bryce pays the following tribute, which is worth quoting:

"I cannot mention the American missionaries without a tribute to the admirable work they have done. They have been the only good influence that has worked from abroad upon the Turkish Empire. They have shown great judgment and tact in their relations with the ancient churches of the land, Orthodox, Gregorian, Jacobite, Nestorian, and Catholic. They have lived cheerfully in the midst, not only of hardships, but latterly of serious dangers also. They have been the first to bring the light of education and learning into these dark places, and have rightly judged that it was far better to diffuse that light through their schools than to aim at a swollen roll of converts. From them alone, if we except the British consuls, has it been possible during the last thirty years to obtain trustworthy information regarding what passes in the interior."

We need hardly add that the missionaries have fully confirmed nearly all the accounts of the atrocities.

The general summing up of Mr. Bryce's narrative is, that the massacres were deliberately planned as a political measure; that either England alone or the great Powers might have stopped them in a very early stage; that the discredit of non-interference falls more heavily on England than on any other, as she alone had a separate treaty with the Porte, providing for Christian protection, and, indeed, guaranteeing it, and had prevented Russia in 1877 from reducing the Porte to helplessness; that the responsibility of this hesitation or timidity must be borne by Lord Salisbury, who himself, in 1877, formulated the policy which made England in a certain sense an ex-officio patron of the Christians. There are some plain inferences to be drawn from this, though Mr. Bryce does not draw them. The principal one is, that, contrary to the general expectation, Lord Salisbury has not proved to be a man of action at all; that his epigrammatic and caustic speech really gives no idea of his real character, which at crises is apparently one of great irresolution; that at Berlin he was probably dominated completely by Disraeli, and that the Irish are the only people who have any reason to be afraid of him.

MORE SAVANTS IN CONVENTION.

JANUARY 3, 1897.

ON the last three days of the year just passed, the Modern Language Association of America and the Central Division of the Association held their annual meetings — the National Society at Cleveland, as the guests of Western Reserve University, and the Central Division at St. Louis, as the guests of Washington University. The National Society has usually met in the East, most often at Washington, last year at New Haven. Western members thus found it difficult and expensive to attend the meetings, and, as Western Reserve University had for some years invited the Society to its halls, the invitation was accepted, and, for the second time since its organization, the Society crossed the Alleghanies and made it possible for a larger number of Western men to attend its sessions. In fact, it was generally understood that the Central Division would reciprocate and meet with the National Society. The step taken by the national body was, however, misunderstood, and the committee with whom the final decision rested called the meeting of the Central Division at St. Louis, and for the same days on which the National Society was to meet at Cleveland. For a time it seemed as though the two bodies would drift quite apart, but better counsels prevailed, and supplementary resolutions defining terms of coörganization were adopted.

Under the circumstances, it is of much interest to observe what parts of the country were represented at each meeting. The National Society listened to papers from Rhode Island, New York, Ohio, Michigan, and Maryland—really a very restricted territory. With one exception, the New England people found Cleveland too far west, while the only representatives of the South came from Johns Hopkins, the birthplace of the society and the home of its secretary and treasurer. There were no papers from west of Ann Arbor and none from Canada. Of members not reading papers there were representatives from all parts of the North as far west as Iowa; but the Ohio colleges furnished the larger number. On the other hand, neglecting the two papers sent on from Stanford University, the St. Louis meeting listened to papers from Missouri, Illinois, Indiana, Tennessee, Alabama, Mississippi, and Louisiana; that is, from States bordering on or very near the Mississippi. Not counting the delegation from Chicago, the birthplace of the Central Division and the home of its secretary, readers of papers at St. Louis were almost exclusively from the middle South. It is thus evident that the two bodies are representative of the North and the South at least as much as they are of the East and the West. The point of nearest approach is in the Northwest, where the two leading institutions part company, Chicago sending a large delegation and three papers to St. Louis, and Michigan doing the same by Cleveland.

The representation at either convention naturally depends somewhat on the place where the meeting is held. Thus, when the National Society met at New Haven a year ago, nine papers were brought from New England colleges, and five from the University of Pennsylvania; but this year Pennsylvania sent no papers at all to Cleveland, and all New England sent but one. The institutions that are well represented, regardless of the place of meeting, are Michigan and Johns Hopkins; the former sending three papers to both New Haven and Cleveland, the latter sending two to New Haven and three to Cleveland. Such facts as these had to be considered when choice was made of the place of the next meeting, and Philadelphia was decided upon —in spite of hearty invitations from Toronto and Virginia—in order that the meeting might not so soon again be far from New England and the eastern Southern States.

The opening paper at Cleveland was by Prof. Hempl of Ann Arbor, and explained the difference between such words as learnèd —learn'd, blessèd—bless'd, etc., as due to the different rhythmical conditions under which the adjective and the participle respectively occur. In the absence of Prof. Wood of Johns Hopkins, his paper on Goethe's sonnets was read by his assistant, Dr. Baker, and aroused considerable interest. Prof. Scott of Ann Arbor presented a suggestive point of view from which to study the development of power in the command of language, but his title, "Diseases of English Prose: A Study in Rhetorical Pathology," did not find favor. Dr. McKnight of Cornell gave a résumé of his studies in the order of words in primitive Teutonic. In a paper on *b* after *r* and *l* in Gothic, Prof. Hench of Michigan showed the invalidity of the grounds on which this *b* has hitherto been regarded as a stop consonant.

The method pursued by Dr. Charles Davidson in his paper on "The So-called Eye-Rimes in *o* in Modern English," subjected the paper to criticism. There were two papers on comparative literature—one by Dr. Meyer of Western Reserve University, on "Machiavelli and the Elizabethan Drama," and one by Mr. R. E Neil Dodge of Brown University on "Spenser's Debt to Ariosto." And Dr. Marden of Johns Hopkins read a paper on the "Crónica de los rimos antiquos." The boundaries of the *ka-* and *che-* districts in the north of France were traced by Dr. Bonnotte, also of Johns Hopkins. Dr. Woodward of Columbia made an interesting report of the work of the Rumanian Academy, and read a paper sent by Prof. Todd, giving an account of the life and work of Gaston Paris.

The address delivered on Tuesday evening by Prof. Thomas of Columbia, President of the Association, on "Literature and Personality," not only was a very satisfactory presidential address, but was at the same time preeminently the most valuable paper of the session; reminding one of the address delivered some years ago at the meeting at Cambridge by the Society's distinguished President, James Russell Lowell. Among the papers read at St. Louis, one by Prof. Fluegel of Stanford, presenting some new interpretations of certain passages in Chaucer's Prologue, and one by Prof. Weeks of the University of Missouri, on experimental physics, demand special mention.

JANUARY 3, 1897.

At the twelfth annual meeting of the American Historical Association, which was held in this city on December 29-31, an important step towards future prosperity was taken, some interesting papers were read and discussed, the first report of a commission destined to do great things for the future of the study of American history was presented, and a committee was appointed which may materially assist in the needed work of regularizing education in history in the secondary schools. The large attendance of members from all parts of the country testified to the wisdom of the council in fixing New York as the place of meeting, and the arrangements made by the local committee were generally commended. At the Tuesday morning session, President Warfield of Lafayette College read a paper on Melanchthon, with special reference to the celebration of the quater-centenary of his birth, and among the other papers to be noted was a vigorous declaration by Mr. C. H. Hart of Philadelphia that Peale's celebrated original portrait of Washington was only defaced and not destroyed by the Tories in the days of the Revolution. In the evening Dr. Storrs of Brooklyn gave his address as President of the Association, in which he emphasized the services to the country of men hardly mentioned by the historians.

The most interesting feature of the Wednesday morning session was a brilliant paper by Prof. J. W. Burgess of Columbia University on "Political Science and History," which was followed by a lively discussion; and in the evening session there took place a conference on the teaching of history in which Profs. Herbert B. Adams of Johns Hopkins University, Emerton of Harvard, Andrews of Bryn Mawr, McMaster of the University of Pennsylvania, and Robinson of Columbia were the speakers. The lateness of the hour prevented the discussion from being as fruitful as had been hoped, and it was generally desired that the subject might be further discussed at the next annual meeting.

At the Thursday morning session, Prof. Jameson of Brown University presented the first report of the Historical Manuscripts Commission, which was constituted by the Association last year. This Commission has set out in workmanlike fashion to do for the United States what the Royal Historical Manuscripts Commission has for some years been doing for Great Britain. Its first task has been to discover what manuscript material exists for American history in public or private hands. The first part of the report, which will in due time be issued to the members of the Association, deals with this question, and the Commission will next proceed to print, in full and not in the form of calendars, series of the most important documents it has brought to light. Prof. Jameson's report was listened to with deep interest, and was followed by a paper by Prof. F. J. Turner of Wisconsin, on "The West as a Field for Historical Study." This paper was read by Mr. Reuben G. Thwaites, and was favorably commented upon in effective speeches by Professors McLaughlin of Michigan and Woodrow Wilson of Princeton.

At the last session, on Thursday evening, it was recommended that the next meeting of the Association should be held at Cleveland on the last three days of 1897, and the names of the officers for the year were announced. Mr. James Schouler was chosen president, Dr. George P. Fisher and Mr. J. F. Rhodes, vice-presidents, and the other officers of the Association were reëlected, with the addition of Dr. E. M. Gallaudet of Washington in the place of the late Dr. G. Brown Goode. At this concluding session a letter was read from the National Educational Association, requesting that a committee should be deputed from the Historical Association to draw up a scheme of historical instruction for secondary schools in conjunction with a committee of its own. The request was favorably received, for one of the great needs in historical teaching is better coördination between the secondary schools and the colleges, and a committee was appointed to deal with the question consisting of Professors George B. Adams, Lucy M. Salmon, Herbert B. Adams, Charles H. Haskins, and H. Morse Stephens, with power to add two to their number.

No account of the recent meeting would be complete without some mention of its social success. It was feared that the change from Washington, where the kindly hospitality of the Cosmos Club had always been so much appreciated, to New York, would cause the cessation of that friendly intercourse between the older and younger historians and teachers of history, and between former colleagues and former masters and pupils, which had been such an attractive feature of the gatherings of the Association. To prevent the scattering of the members, a room was hired in the Windsor Hotel as the headquarters of the Association, in which the friendly intercourse of the Cosmos Club was renewed upon a larger scale. The local committee went a step further, and organized an Association breakfast, which was held at the Windsor Hotel on Wednesday, December 30. Dr. Storrs presided, and over a hundred members sat down to the breakfast. The speeches which followed were brief, but effective, especially those of the genial chairman, of Mr. Justin Winsor, of Mr. Edward Eggleston, and of President Gates of Amherst. This brief mention of the social features of the meeting should not conclude without a word of recognition for the kindness of the Authors' Club, which invited members of the Association to be present at their unique watch-night celebration; and a cordial mention of the untiring labors of the local committee, Mr. C. W. Bowen and Prof. W. A. Dunning, to which the success of the meeting was mainly due.

It should be added that the annual meeting of the guarantors of the *American Historical Review* was held in connection with the meeting of the Association. The Hon. Peter White of Marquette, Mich., was elected chairman of the meeting, Prof. W. M. Sloane was reëlected an editor of the *Review*, and a vote of thanks was passed to the board for its successful labors during the past year.

JANUARY 3, 1897.

The fifth annual meeting of the American Psychological Association was held in Boston and Cambridge in connection with the American Naturalists and the Affiliated Societies on December 29 and 30. The programme was very crowded, and was made more so by the setting apart of the whole of Tuesday afternoon for the Naturalists' discussion of Heredity. The business meetings were agreeably broken by the luncheon given by the President and Fellows of Harvard College on Wednesday, and by the lecture and reception by Professor Agassiz on Tuesday evening. The two tributes to the memory of Louis Agassiz, made respectively by President Eliot and Prof. W. James, were heard and appreciated by the members of all the societies. In the programme of the Psychologists there was little that lends itself to popular statement. Perhaps most of the members would agree that the most interesting experimental communication was made by Prof. G. A. Tawney, formerly of Princeton, now of Beloit College, Wisconsin, who showed the extraordinary influence which suggestion has in the discrimination of two points in contact with the skin. He found that the reduction of the "double-point threshold"—the smallest distance apart at which two points are apprehended as two—is reduced by practice not alone for the region directly stimulated, and not alone for the homologous points on the opposite side of the body, but also for the whole surface. The variations which he was able to introduce in the results both for simultaneous and for successive two-point stimulations, led him to the conclusion that suggestion directly influenced the so-called "threshold." His paper is to appear in an early number of Wundt's *Philosophische Studien*. Mr. J. E. Lough of Harvard reported an apparatus whereby he demonstrates that a given intensity of light stimulation may be matched by a longer or shorter duration of stimulation of a light of a different intensity; and made some generalizations regarding the theory of sensation intensities.

The more philosophical papers were put together on Wednesday morning, but the time was too short for the proper reading and discussion of them. One discussion was precipitated by two papers on "Mind and Body," but that was cut short. The council of the Association is charged to reconsider (for the next meeting) the question of admitting and dividing off the more unpsychological papers. In the afternoon session on the same day the President, Prof. Fullerton, saw fit to challenge the members of the Association — or some of them—who have had the temerity to hold positive views regarding the "Knower in Psychology." His address appears in full

in the January number of the *Psychological Review;* and the proceedings will appear in the same journal for March.

Besides the regular programme of the Association, two other matters occupied the attention of members—one, the preliminary report of the committee appointed last year to consider the subject of Physical and Mental Tests, and the other the discussion of the Naturalists on the "Inheritance of Acquired Characteristics." In the latter very little that was new came out, in spite of the inordinate length of the discussion. In this a poor example was set to the philosophers. The committee on tests reported a provisional list which is to be printed and considered for another year. The new officers for next year are: President, Prof. Mark Baldwin of Princeton; Councillors, Prof. Josiah Royce of Harvard and Prof. Joseph Jastrow of Wisconsin University.

THINGS GRECIAN.

LONDON, December 26, 1896.

ON Christmas eve the authorities of the British Museum made public, with a promptness in giving that is in harmony with the season, a summary description of the new treasure from Egypt which came into the Museum late in the second week of December. The papyrus MS. consists of thirty columns of writing, half of which contain the full number of thirty-three complete lines, while the remaining fifteen columns have been variously broken and torn. To piece out what they lack, there are fortunately numbers of small fragments, some of which have already found their place, while there is reason to hope that, with time, patience, and skill, others will eventually be so fitted in as to make good in some measure the mutilation which is due to rough handling by the first discoverers. The MS. is well written in large uncials, and appears to belong to the first century B. C. The date of its proposed publication by the Trustees cannot, for reasons suggested above, be definitely fixed.

Nothing in the way of a general heading to indicate the authorship appears upon the papyrus, though there are titles for special poems, such as "Theseus," "Io," "Idas." It is not clear, apparently, whether the poems bearing these titles are epinician or not, though they and all the others appear in some sort to celebrate victories, and a certain number of them are easily identified as containing known fragments of Bacchylides. To readers of Pindar's first Olympian ode it will be interesting to know that, when the Trustees of the British Museum shall have published this MS., we shall be able to read the rival ode written to commemorate the same event by Bacchylides; a composition which, as beseemed the occasion and competition with so great a fellow-poet, was of considerable length. In addition to Hiero of Syracuse, Lachon of Ceos (Bacchylides, like his maternal uncle, Simonides, was of Ceos), Alexidamus of Metapontum, Tisias of Ægina, and Automedes of Phlius are among the victors named. The victories celebrated, like those of Pindar's odes, are in all the principal games, Olympian, Pythian, Isthmian, and Nemean. It is too early as yet to say how many poems are contained in the new MS., but there are not fewer than fifteen, and probably not more than twenty, varying in length from fourteen to two hundred lines.

It has become the fashion, especially of late, to visit Bacchylides with a certain amount of scorn, discoverable by the microscopic eye in various passages of Pindar. However, the definiteness of Pindar's reference often leaves a great deal to be desired, and the estimates of his rival's literary merits based upon so very shifting a foundation may have to be reconsidered. For now, though we are not to have a complete Bacchylides, there will be enough to form a sound opinion of his poetical power. It appears that he is easier than Pindar, has a graceful and pleasant style, and a picturesque, poetical vocabulary, but little or none of Pindar's strength and splendor, and nothing of Pindar's forced and strained diction. There is a well-known passage of intense obscurity at the close of Pindar's second Pythian ode, where, as in a far plainer passage of his second Olympian ode, the Theban bard mocks at poetical skill that is acquired and not inborn. Here and elsewhere in Pindar Bacchylides is supposed to have been satirized, and Bacchylides is supposed to have answered Pindar in lines preserved by Clement of Alexandria, wherein he declares substantially that absolute originality in song is a thing that never was and never will be. The poetical workmanship of the newly discovered epinician odes of Bacchylides would seem to agree with this point of view, and to indicate that the lesser bard of Ceos was distinguished rather for the Sophoclean quality of sweetness and serenity than for the boldness of a Pindar or an Æschylus. His originality, such as it is, shows rather in the convivial strains preserved under the title of love-songs among Bergk's fragments. Of these lighter songs, in which Bacchylides shows qualities not possessed by Pindar—a superior nimbleness of wit and a real sense of humor—the newly found papyrus unfortunately gives us nothing.

These newly recovered epinician odes will be published for all to read as soon as may be, probably in the course of a few months. In looking forward to their perusal, it will probably be well to forget the somewhat scornful attitude adopted of late toward the nephew of Simonides, notably by Flach, and to remember the high place among lyric poets assigned to Bacchylides by the unknown authors of two well-known numbers (184 and 571) in the ninth book of the Palatine anthology. The first begins, "Pindar, thou holy mouthpiece of the Muses, and Bacchylides, thou Siren of smoothe and specious tongue," while in the other epigram we read that "Alcman was sweet, but Bacchylides distilled from his lips speech that was delicious to the ear." We may well rejoice at the prospect of knowing at first hand a lyric poet in whom Sophocles delighted, and who was the inspirer of some of Horace's most memorable strains.

The second instalment of the programme or album (λεύκωμα) of the Olympic games of 1896 contains a complete account of the Panathenaic stadium (where the recent games were held), written by Prof. N. G. Politis, who lectures at the University of Athens on mythology and Greek archæology, and is well known among anthropologists as a careful student of Greek folk-lore, ancient and modern. This monograph is published in modern Greek, with a French translation in parallel columns. It follows the history of festal games, especially of horse-races, in Attica from the mythical days of Theseus, and the epoch of those chariot races pictured upon the Dipylon vases, to the recent restoration for athletic purposes of the ancient Athenian stadium. From the heroic days of Theseus to the modern munificence of M. Avérof is a far cry, but the broad view of the unity of history implied by such a continuous account is one which would assuredly have rejoiced the soul of the late Prof. Freeman.

The Panathenaic stadium was not built until after the battle of Chæroneia, when the great Athenian administrator Lycurgus took it in hand. Before this, during all the most glorious days of Athenian power, the Panathenaic games were held in an open space half way between Athens and the Peiræus. There were apparently no special seats for the spectators; only a wooden stand for the presiding magistrates is likely to have been provided. When Lycurgus chose the site for the stadium, Dinias, its proprietor, presented it to the city out of regard for his friend Lycurgus. The mere preparation of the ground required vast expense, and Eudemus, a Platæan domiciled at Athens, is formally thanked by a vote passed in 329 B.C. for contributing generously to the expenses. Only a few seats of honor were provided by Lycurgus's scheme, and the spectators had to sit on the ground for the most part, as indeed was the case in 1875, when there was an Olympic celebration which attracted no great notice outside of Greece. It may be that the recorded work done on the stadium in the second century after Christ provided seats of some kind, but the sumptuous renovations and decorations undertaken by Herodes Atticus eclipsed all that had gone before. In the space of four years he made over the whole stadium with marble, and, as Pausanias enthusiastically exclaims, "He nearly exhausted the quarries of Mt. Pentelicus." That was an age when mere bigness riveted popular attention, and excited such admiration for the stadium that its fame eclipsed for the moment everything else at Athens, even the Parthenon. Indeed, this new stadium was built so as to accommodate gladiatorial shows and vast numbers of wild beasts hunted down for the amusement of the crowd. After this we are prepared to hear that in mediæval times the stadium was altered so as to serve as an arena for knightly tournaments, and we feel, with some satisfaction, that its recent reconstruction at the expense of M. Avérof has restored it to uses far more in harmony with those contemplated by Lycurgus, Dinias, and Eudemus than any of the shows for which it was used in Hadrian's and Herod's day.

LOUIS DYER.

TAINE'S PROVINCIAL NOTE-BOOKS.—I.

PARIS, December 31, 1896.

FEW men have had as much influence as Taine on the present generation in France. Renan may be compared to him in this respect, but the influence of Renan will perhaps be more ephemeral, as he applied his extraordinary powers of mind to subjects which have little to do with what might be called the common life of a nation. Taine attempted, and partly succeeded in the great task, to explain the origins of contemporary France. His three volumes on the Old Régime, the Revolution, the Modern Régime, have been read with avidity by all politicians as well as by all philosophers; they will be read for a long time by all who try to understand the enigmas of the troubled history of France during the present century.

Taine had to accept in his youth places which yielded him a small salary, before he achieved a complete independence. From 1863 to 1866 he was examiner for the military

school of Saint-Cyr, a very tedious work, which obliged him to travel all over France and to examine on literature and history a number of ignorant youths. He fortunately had the habit of keeping diaries and of taking notes wherever he was. The notes he took in England helped him to write his 'History of English Literature'; his notes taken in his wanderings in Paris were used in various books. Those taken in the French province in 1863–1865 were never revised, and he himself thought them too fragmentary to form the foundation of a book. His heirs have recently published them in a volume, without any alteration. They have been blamed for it by some critics; some others say that these 'Carnets de Voyage: Notes sur la Province,' are unworthy of the author of so many important works. I cannot agree with these critics. The intelligent reader can perfectly well make allowance for the rapidity, the disorder of the impressions noted in this posthumous publication; he will not regret to see the mind of Taine, so to speak, at work in such an interesting field as the province and cities of France; and he will discern in these sincere and spontaneous impressions the germs of many of the ideas which found their definite form in the 'Origines de la France Contemporaine.'

In some respects, what we call "la province" is to many a terra incognita. It was so to Taine, who had received in his youth a classical education at the École Normale, and whose mind was associated chiefly with all that is represented in the short word "Paris." For centuries, France was subdivided into provinces, well defined by geographical, ethnographical, and geological differences; these divisions were consolidated and perpetuated under the feudal régime. The process of centralization lasted for four centuries; it was the work of the monarchy and of its great ministers. It became complete only when the Revolution broke down all the barriers of the past, abolished all feudal rights and privileges, destroyed the powers of the local parlements, and substituted artificial departments for the old provinces. Since that time, it may be said that there have been no provinces, only "la province." The Empire continued the work of the Revolution; the various governments which have in turn administered France, alike found it convenient to use the all-powerful machinery prepared by the absolute monarchy and completed by the Revolution.

In his wanderings through France, Taine came chiefly in contact with the humbler instruments of French centralization, the professors in the University of France, the colony of office-holders which is found in every departmental and arrondissemental *chef-lieu*, the officers of the army. At Douai he meets an old comrade married to a Bordelaise:

"She receives me in a colored apron coming out of the kitchen. 'I occupy myself,' she says, 'with my kitchen; my husband scolds me, but I answer that he likes a good dish. He wants me to go out into the world; I have not been once in three years—it bores me. One has so much to do at home with two children. . . . Oh, he will not go to Paris—I don't want him to go; we will remain here.' There are many such women in the province; they have not much to say and are ill at ease at the dinner-table. Society embarrasses them. . . . My friends tell me that the majority of these women are *pot-au-feu* to excess; only a few pretend to be fashionable, to be Parisiennes. A woman in the province most frequently finds her employment and the complete use of her faculties in needlework, clothes-mending, and the management of the household."

Taine finds the official society at Douai correct and agreeable. The Dean of the Faculty gives soothing lectures on history, to which ladies take their daughters; no serious professors nor pupils. Good society — magistrates, officers, retired functionaries—comes to these Faculty lectures to occupy an hour. A Faculty is a literary casino.

At Le Mans, Taine writes:

"How one feels, in a single walk, the social state of France. How low still is the body of the nation, how near the serfs and burghers of the Middle Ages, with functionaries instead of noblemen. These functionaries, without consulting them, provide them with markets, courts, schools. On the whole, the masses have what they want—the narrow bourgeois life and the privilege of selling as they like their grain, their fruit. . . . Equality is practised; there is no favor, even for the very noble or very rich; the judges judge abstractly, without knowing names. The most salient trait, one which produces much good as well as much evil, is this: The constructor of France seems to have said to himself that there is a certain amount of good things, and that each ought to have a bit; that nobody ought to have a very large bit, but almost all a small or a moderate-sized bit. The generals of division, bishops, heads of colleges, rectors, directors, etc., attain to 15,000 francs or the like; the small salaries of 1,200 to 3,000 francs are innumerable. Each advances a little every three or six years—an increase of 100 to 500 francs, a cross of Knight of the Legion of Honor, afterwards of Officer. These officials are cared for in their old age; they have a pension, their widows also; in life, with this gradual advancement, every one knows nearly where he will be in twenty years. Great injustices are nearly impossible; many small discontents, annoyances, jealousies, hopes, expenses, economies—no great despair. Such is life made rational."

It is impossible to give a clearer account of our great set of functionaries, a true nation within the nation. Hear, again, this:

"Society is like a great garden: it is cultivated either for peaches and oranges or for carrots and cabbages. Our garden is prepared wholly for carrots and cabbages. The ideal is that the peasant should have meat to eat, and that my shoemaker, having saved three thousand a year, should be able to send his son to the Law School. The distinguished men attain no eminence—at the utmost a meagre pension; their salary just helps them not to starve. Colonel L., who entered the Polytechnic School at the age of sixteen, and came out of it second on the list after forty-four years of service, has a pension of four thousand a year."

Taine, at the time an examiner, condemns the system of examinations, and calls it Chinese, yet admits the necessity of a test when there is so much competition for office. Memory has too great a part in examinations. At the examination for admission to the title of *agrégé* in history, a candidate gave the ancient and modern history of a hundred and fifty islands in the Mediterranean Sea, etc.

Taine consoles himself with the beauties of nature and with the masterpieces of art; his descriptions are charming. He tries also to study the popular types; he describes admirably the Bretons and the Bretonnes. But what curious contrasts in his notes. Speaking of the young Bretonnes, he says: "No regular beauty, no air of health, something weak, suffering, pale, a little crushed; but in some it produces an admirable expression—perfect virginity, the virginity of body and soul, an exquisite sensibility, a charming delicacy, a strange suavity. I think of the Indian saying, 'Don't strike a woman, even with a flower.'" "Certainly the pure heroines of ancient chivalry, the mystic lover of the novels of the Holy Grail, Elaine, Yolande, come from there. . . ." And on the next page you may read this: "The soldier who takes me to the barrack tells me that no country has such loose morals. In the daytime, they don't look at you; in the evening you have but to speak." Here we can point to one of the great defects of Taine—his love of generalization, on insufficient data. It is hard to condemn a whole race on the testimony of a soldier. This passage reminded me of a well-known story of the man who, having found a red-haired servant in an inn, writes in his diary, "Here, all servants are red-haired."

The ideal formed by Taine in his studies and in his Parisian life is offended everywhere in the province. He finds everywhere an inferior view of life, and French democratic society appears to him flat and monotonous. "To be complete," he says, "a man ought to have leisure, to have no forced and daily work; he ought not to be always thinking of his own interests; he ought to be preoccupied with general views, like the British aristocrat of the present day, like the Romans and Athenians of antiquity. An aristocracy, in order to last, must employ its strength and its time for the public." He feels at the same time that a country is like a garden, that all soils are not alike. "It is absurd to try to grow bananas on the chalk of Champagne; in short, France produces now the sort of vegetables which it is able to produce. For elevated minds, the remedy consists in not falling into the bourgeois life, in living alone like a Buddhist."

Taine becomes at times severe to injustice; he is haunted by the English ideal of the gentleman, and pretends not to find it in France:

"The gentleman is not found in France. See all these great personages, functionaries or proprietors, who come to solicit us for their sons, asking us to deprive somebody else of a place in order to give it to them. Whether impudently or delicately asked, it remains, nevertheless, an injustice. They consider favor, even improbity, as quite a natural thing; . . . it is a tradition in France. Under the former monarchy it was necessary to solicit the judges. . . . At the present moment you cannot get an article in the press except by favoritism. On the contrary, C. told me that in England you never thanked a paper for an article; it would be an insult. See in Carlyle's Life of John Sterling the letter of Sir Robert Peel to the editor of the *Times*, and the answer. Here it is the kingdom of grace, and there the kingdom of justice."

Correspondence.

PENNSYLVANIA.

To the Editor of The Nation:

Sir: There never has been a time since 1860 when Pennsylvania had a Democratic party in full accord with the party which went by that name in the rest of the Union. No sooner had the war begun than Samrandallism took possession of the Pennsylvania Democracy (such as it was) and perverted it to the purposes of the Republican party. The whole struggle of the Democratic party in the State since the close of the war has been an internecine one, in which the party in the rest of the Union has had no sympathy and little interest. Sound Democratic doctrine, good government either State or Federal, has cut no figure in Pennsylvania. No appeal has been made to the people to uphold tariff reform and sound money as Democratic doctrine. The party has been contented with an occasional success wrought out by Republican Mugwumps upon local and personal issues; and

the long habit of accepting any proposition which seemed novel and popular at the time, had its logical conclusion in the last Democratic convention which met at Harrisburg in September and declared for free silver, in the face of the declaration of the same convention at Allentown, in April, that it was "absolutely opposed to the free coinage of silver."

The "regular" party has gone to pieces. It is a total wreck so far as its usefulness as a part of any national organization is concerned. It is in the hands of the Populists, who have no knowledge of nor care for the inherent principles which have made its glorious history. It cannot hope to elect anybody to anything. It has no claim to any consideration from the masses of the voters of the Commonwealth, and it gets no such consideration. It is not taken into the account in any State or county election where any important issue is involved. It is not a factor in the equation of any public question, and it does not intend to be. It officially declares its desire that all who believe in tariff reform, sound money, and the policy of the only Democratic administration since the war, shall keep away from its primaries and keep out of its conventions. Bryanism and Gormanism are its creed and it has no future. It is too dead to skin.

But nowhere in the Union is there a State where the real Democratic party of Jefferson and Jackson and Madison and Benton and Tilden and Cleveland has a more splendid opportunity than in Pennsylvania. No prominent Democrat in the State who has any standing for courage and brains will take any part in the folly which has led the "regular" organization to destruction. Every sturdy Democrat who has heretofore guided the councils of the party, until it surrendered to Populism, has definitely cut loose from that error, and, by a most natural gravitation, has allied himself with the National organization which adopted the Indianapolis platform and nominated Palmer and Buckner. The Republican party in the State is ready for disintegration so soon as the Jeffersonians make the issue of good government plain to the people. Its willingness to make Quay its candidate for President, its present limitation of choice for United States Senator to Penrose (!) and Wanamaker (!!), its complete possession by the "combine," the very attitude of its worst elements as advocates of Reform (!!!), the compulsory retirement of its intelligence to make room for its cunning—would work its immediate downfall if the Sound-Money, Tariff-Reform Democratic organization were as fully established as it will be a year hence. Whether Quay wins by electing Penrose, or Martin wins by electing Wanamaker, or Cameron succeeds himself, as a person no better than he should be, but no worse than the others, it is all the same. There is no help for Pennsylvania save in a return to first principles through an active, aggressive, continuous campaign by the National Democracy; and its efforts in this State ought to have the encouragement of all who desire good government. The Democratic party of the future can go into power at the next Presidential election. It is on the cards to make Pennsylvania contribute to that result thirty-two members of the electoral college; and Pennsylvania, Democratic, means Sound Money, Tariff Reform, a healthy and adequate banking system, wise fiscal and currency legislation, and a firm and dignified foreign policy.

The principles set out in the Indianapolis platform are the only reliable foundations upon which any party can build a policy that will have or ought to have the support of patriotic Americans, and they have the sanction of all Democratic precedent. They will have, because they will deserve to have, the patriotic endorsement of the people throughout the Union, as they would have had it if the Chicago convention had not been stampeded to silverism. A large majority of the Bryan people who were Democrats in June last now see the egregious blunder of the Chicago platform. They are already cursing their blind leaders who have led them into the pit; and they will repudiate that platform and adopt that of Indianapolis as soon as they have a reasonable opportunity. Vast numbers of intelligent Republicans have been entirely satisfied with Mr. Cleveland's administration, and are ready to support the Indianapolis platform as better than anything they can expect from the Republican party. When these see the lines formed upon the true doctrines which the National Democrats have reasserted, and which Mr. Cleveland has practised with such admirable vigor, the end of anarchy and misrule will be in sight.

B. C. Potts.

Media, Pa., January 5, 1897.

THE DEPARTMENT OF AGRICULTURE.

To the Editor of The Nation:

Sir: In his last admirable report, Secretary J. Sterling Morton, in his usual terse language, recommends active measures for the purpose of opening up new markets for our farm products. It is to be hoped that his successor will follow up this timely suggestion by sending commercial agents to places abroad where there is prospect of establishing or extending such markets. There is great need of such agents to keep the farmers advised of the demands of the markets, the quality of goods and the style of packages desired by the consumers, etc. The farmers cannot be content with the reports obtained through the export merchants only, as their interests do not always agree with those of the producers.

But there is another class of agents who might be even more useful to the farmers, and by the appointment of whom the Department of Agriculture would make itself appreciated. I refer to scientifically and practically educated farmers, or, rather, specialists in the various branches of agriculture, who should be sent abroad to agricultural centres to study improvements and report on progress made in farming and industries connected with farming. Most governments have military attachés employed in their embassies and legations. The United States is not a military country, but a farming and industrial country. Why not have highly educated agriculturists attached to our legations abroad?

Some years ago a voluminous book was published by the Government, containing reports from our consuls, especially on cattle and dairying. Among a lot of rubbish the book did give some valuable information, but most of the contents bore witness to the not very surprising fact that the writers knew little or nothing of what they were talking about. How should they know? Farming, cattle-raising, dairying, etc., are no longer simple things that any practical man can master without special education. Science has entered the field, and it is now necessary to make the profession a life study in order to be a successful farmer, or dairyman, or fruit-grower, or expert in any other branch.

The Department of Agriculture has been, and is partly yet, the subject of ridicule, and is by many regarded as an almost useless institution. It is comparatively new, and its scope of usefulness must gradually be found and developed. If properly employed, it will in time prove invaluable, and we shall wonder how the country could ever get along without it. Secretary Morton has done great work in purifying the department, abolishing abuses and spoils, and saving some millions of dollars which may be turned to better account. His exposure of the ridiculous and scandalous seed-distributing business will bear fruit in time, and the congressional seed-peddling will have to go. A splendid system of report and coöperation between the excellent experiment stations all over the country and the department has been instituted. A dairy department has been established which has already done good work under the direction of its efficient chief, Major Henry E. Alvord, and forms a valuable basis for further development of useful measures in the interest of the great dairy industry. Mr. Morton's successor will have a clear track to follow, and must rejoice that the purifying work has been done, and that he can devote his energy more fully to the introduction of new, useful measures such as the development of our markets, and educational work.

Thousands of dairymen all over the country hope that Mr. McKinley's Secretary of Agriculture will be a representative dairyman like ex-Governor W. D. Hoard of Wisconsin, and that the just claims of the great dairy industry will be considered by the incoming Administration. In no branch of farming is competition keener, and, if we are to hold our own in foreign markets, we must know what is being done abroad. J. D. Frederiksen.

Little Falls, N. Y., January 8, 1897.

CONCERNING ACCREDITED SCHOOLS.

To the Editor of The Nation:

Sir: The system of admitting students to college on certificates and without examination may or may not be the best; your Californian correspondent, however, shows quite plainly that no real test has been made in that State. Assuming him well informed as to the facts, what are we to expect from any system in which faculty examiners and school principals certify that things are when they are not?

Here in Michigan the system of diploma schools has been given its fullest and longest trial. The current calendar of the University shows that 152 schools possess the complete or partial right of admitting their students by certificate; the list includes all the principal schools of Michigan and many of those in surrounding States. Those interested are, I think, agreed as to the efficiency of the system when reference is made to the matters touched upon by your correspondent. There is abundant evidence that the University exercises due caution, and that the schools honorably meet the responsibility placed upon them. There can be no question that, as between an entrance examination fairly conducted and a certificate honestly earned, the fairer test is found in the latter; but, like all systems, the practical working depends altogether upon the character of those who apply it.

For other reasons the whole question is of the greatest interest, and, like all educational

problems, opens the whole field. It may be permitted me to touch briefly on the chief arguments both for and against the system of admission by certificate.

The chief advantage of the plan is that other elements than knowledge of set topics may have weight in determining a candidate's right to enter college. To say nothing of the facts that an entrance examination is a very partial and very incomplete test, and that passing it proves generally the lucky candidate to be possessed of some mental lumber rather than of some mental power, it is patent that the system of entrance by examination takes no account of individuals. I am not one of those who regard college opportunities as the privilege of any sort of intellectual aristocracy; rather, I am deeply convinced that every boy who faithfully applies himself in his preparatory studies, and with diligence accomplishes according to his abilities, should feel that he has an inalienable right to go to college if he desires so to do. This is a debatable question; but those who feel with me must have a very friendly feeling for a plan of admitting students to college which concerns itself rather with what the boy is, than with what he happens to have.

On the other hand, an equally great difficulty stands on the other side, although the whole entrance system shares in it. The tendency of the diploma system is to make the high school a mere fitting school for college. No school should be that, and the public high school peculiarly should not. The suggestion implied in this last principle shows where the peculiar danger of the diploma system lies. State universities very generally employ this plan of admitting students, and thus the danger is greatest at precisely the point where it ought to be most guarded against. It may be said that no school ought ever to be a fitting school for any other, while every school ought to be fitted to some lower one. Half the young men of this country to-day regard their secondary studies as mere stepping-stones into college arbitrarily selected and arbitrarily placed. Dr. Mendenhall recently emphasized this same idea, and pointed out that secondary courses should be planned as if colleges did not exist. When we begin to plan our curricula from the top down, we follow bad pedagogy and a bad public policy. In this view of the case, the relation between college and school should consist simply in the determination by the one of the character and efficiency of the other.

FREDERICK WHITTON.

DETROIT, January 6, 1897.

SCHOOL AND HOME.

TO THE EDITOR OF THE NATION:

SIR: For five or six years I have entertained the idea that mothers and teachers should coöperate directly in educational methods, or that parents should be in closer touch with schools and school work. In other words, I have thought that if more of the home could be taken into the school, and more of the school carried into the home, prevailing educational ideas and methods might be greatly improved, and far-reaching results brought about.

Although various plans for carrying on this work had from time to time suggested themselves to my mind, until recently no definite course of action had been formulated. Finally, however, in September last, I communicated to Miss Mathilde Coffin, Assistant Superintendent of Schools in Detroit, the idea of attempting to interest the mothers of the city in the cause of education, and suggested that, so far as possible, we induce them to organize for this purpose. To this suggestion Miss Coffin, who, by the way, is among the foremost educators of the country, and the one to whom the Detroit educational system is principally due, replied that she was quite ready to begin the work—that for some time she herself had been thinking along the same line. Accordingly we conferred with about a dozen or fifteen women, who at once signified their willingness to join in the movement. After a series of meetings a plan was formulated which was as follows: It was proposed to organize a league in each school district of the city, of which every woman within it, regardless of creed, color, nationality, or environment, should be asked to become a member. It was decided to have the meetings of these leagues held in the school buildings once every month, after the regular school work for the day was over. At each of these meetings, which were to be presided over by a regularly elected President (usually the principal of the school), there were to be free discussions among the mothers and teachers upon topics best suited to aid in the proper development of the child. Although the work of the local leagues was to be determined by the neighborhood needs and peculiarities, each having the largest freedom, still the central Union prepared a syllabus in which an outline of work was laid out for those desiring to use it. In these syllabi, which were printed and distributed among the mothers, were suggested such topics as the following:

Proper food and clothing for children; care of the body, cleanliness, the way to prevent the formation of injurious habits; the rights of children; proper reading in the home; how to teach the children self-control and to have a proper regard for the rights of others; the duties of true citizenship; and various other subjects intended more especially to be taken up by the mothers in the home. The next syllabus was to deal more directly with the child in the school.

In about two months 37 of the 65 school districts were organized, the president and secretary of each becoming ex-officio members of the central Union. In addition to these leagues, which represent probably 4,000 women, a league was also organized in the Detroit Seminary.

Scarcely were these organizations formed when a movement was started to canvass each district for the purpose of enlisting all the mothers in the work. In fact, at every one of these meetings the willing voices of mothers and teachers reëchoed the sentiments of the originators of this movement, namely, that this is the next step in educational methods. I doubt not, if these sixty-five district leagues could be continued and conducted after the original plan, that, in the course of three or four months, the average membership would reach 300 mothers, each and every one of whom would be actively engaged in practical educational work. These 19,000 or 20,000 women would be enlisted in a movement which has not so much to do with books and regularly formulated methods of instruction as with actual experimental processes of child-culture or character-building. Were such a unified plan of education carried out in every city of this country; were mothers and teachers generally enlisted in a movement involving practical principles of ethics, of true citizenship, and a higher standard of living and thinking, the results for good can scarcely be estimated.

Just here the following question suggests itself: Has society reached that stage where such results are desired? A system like the one which I have described presupposes the coöperation of all those who have a voice in regulating or formulating educational methods; especially is it necessary to have the sympathy, aid, and encouragement of those in authority. Unfortunately, however, in Detroit at this time we have not such aid and encouragement. On the contrary, at the very outset it was observed that petty jealousies and a fear of the growing influence of women would make it difficult for the work to continue. In other words, the unified influence of the mothers of the city might lead to a state of society which at the present time is simply not desired. Hence the untiring efforts which have been put forward to break up these leagues and to check this work.

I have no doubt that in other cities the above plan would from the first prove successful. Even in Detroit, although the Educational Union has for the present been obliged to disband, the attention of the entire city has, through the controversy brought about by this movement, been directed towards the inefficiency of our school management and the necessity for placing upon our Board of Education intelligent and broad-minded men. Although in no other town has there been an attempt to organize on so large a scale, still this movement is by no means confined to Detroit. In New York, Buffalo, Chicago, and various other cities the idea among women of enlisting in a far-reaching educational movement is rapidly spreading. Already a national convention of mothers has been called to meet in Washington, D. C., in February, 1897, the object being to discuss and formulate plans to carry on a campaign in the interest of education. The leading periodicals, journals, and magazines are just now dealing largely with topics relative to schools and educational methods. Indeed, from all directions comes the information that the education of children is the leading question of the day. The hope is that every woman in the country will find interest in this movement, and that she will give to it her hearty coöperation and support.

ELIZA BURT GAMBLE,
President of the Detroit Educational Union.

DETROIT, MICH., January 2, 1897.

Notes.

THE second volume of the translation of Dr. Adolph Harnack's 'History of Dogma' is ready for publication by Roberts Bros., Boston, who announce also the 'Life and Speeches of Governor Greenhalge [of Massachusetts],' edited by James E. Nesmith of Lowell.

Charles Scribner's Sons have in press, in their "American History Series," 'The Middle Period,' by Prof. John W. Burgess of Columbia; also, in a new series, "Periods of English Literature," 'The Later Nineteenth Century,' by Prof. George Saintsbury; in the Gadshill Edition of Dickens, 'The Pickwick Papers,' with all the original illustrations by Cruikshank, Seymour, and H. K. Browne, chiefly from unused duplicate plates in the possession of Chapman & Hall, the London publishers of this edition; and 'Contemporary Theology and Theism,' by Prof. R. M. Wenley of the University of Michigan.

Harper & Brothers will soon issue 'Literary Landmarks of Rome' and of Florence, by Laurence Hutton.

'Geography of the Middle Ages,' by C. Raymond Beazley, is to be issued by Macmillan Co.

The February issue of J. M. Dent & Co.'s "Temple Classics," under the general editorship of Mr. Israel Gollancz, will comprise the first volume of an entirely new edition of Florio's Montaigne, to be completed in six volumes, which will appear at intervals during the present year. The immediate editor is Mr. A. R. Waller, who, besides supervising the text, contributes a glossary and brief notes to each volume.

Henry Holt & Co. announce Gavard's 'A Diplomat in London (1871–72)'; and 'Telepathy and the Subliminal Self,' by Dr. R. Osgood Mason.

The *Book-buyer* states that Mrs. James T. Fields will compose for Houghton, Mifflin & Co. the new Life of Mrs. Stowe, and that Joel Chandler Harris will give them a sequel to his 'Story of Aaron.'

Another work from a Southern hand, 'Diomed: An Autobiography of a Dog,' by John Sergeant Wise, son of the late Gov. Henry A. Wise of Virginia, will be brought out by Lamson, Wolffe & Co., Boston.

Stone & Kimball have in press 'Mlle. Blanche,' by John D. Barry; 'Grip,' by John Strange Winter; 'Ziska,' by Marie Corelli; and "John Gabriel Borkman," Ibsen's new play.

Mr. Francis Darwin makes the interesting announcement that he is preparing a supplementary volume of his father's letters. These will comprise many of purely scientific interest which could not be used in the 'Life and Letters,' together with some fresh material that has come to his hands. He appeals also to correspondents of Charles Darwin's, who may still possess unused letters of the great naturalist, to allow him to make copies of them for the projected new series.

Charles Scribner's Sons have brought out Archibald Forbes's history of 'The Black Watch,' the famous British Regiment also known as the Royal Highlanders. Beginning as a local force to keep the peace in the Scotch Highlands in the early part of the last century, when the adherents of the Stuart Pretender were preparing for the uprising which came in '45, it was soon incorporated into the regular army and showed its brilliant valor in every quarter of the globe. Egypt, Salamanca, Vittoria, Waterloo, Sebastopol, Lucknow are among the "honors" inscribed on the regimental colors. The barest outline of its career is a romance of soldierly adventure, and Forbes has known how to make attractive even the brief chronicles of its battles and its voyages.

Few more worthless specimens of book-making come before us than Mr. John Ashton's 'The Devil in Britain and America' (Scribners). The author has merely extracted from various works of antiquarian research such accounts of demoniacal possession and witchcraft as have suited his fancy, and set them down without order or reason, adding a number of coarse cuts remarkable chiefly for their insignificance. So far as this country is concerned, he has had the good judgment to rely principally on Mr. Upham's well-known work, 'Salem Witchcraft.' An appendix contains the titles of many books on witchcraft and kindred superstitions.

We cannot speak much more favorably of Mrs. Alice Morse Earle's 'Curious Punishments of Bygone Days,' although it is daintily printed with much elegant affectation of the archaic (Chicago: Herbert S. Stone & Co.). Mrs. Earle offers a sort of half-apology for her subject in saying that, although it is not pleasant, yet obsolete punishments have interest and dignity from their antiquity, and their history becomes endurable because they have a past only and no future. It is doubtful if descriptions of the bilboes and the ducking-stool, the stocks, the pillory, and the whipping-post, and their applications, give ordinary readers correct views of the criminal jurisprudence of our ancestors; nor is it certain that this generation requires to "gain from acts of the past a delight in the present days of virtue, wisdom, and the humanities," when we consider the outrageous prison legislation of the State of New York. But we must give Mrs. Earle's work the credit of being in great part the result of original investigation.

Although the report of the First International Coöperative Congress, which was held in London in 1895, is somewhat belated in its appearance (London: P. S. King & Son), it contains a good deal of permanently valuable matter. This is to be found especially in the reports from foreign countries, even Spain and Servia furnishing long lists of coöperative enterprises. The case of Servia is especially interesting as showing how the primitive customs of collective ownership which still prevail among the Slav races, may be used as a basis for modern forms of partnership. Nothing, however, is more encouraging than the success of coöperative methods among the Irish dairymen; success in a small way hitherto, but which may be significant of revolutionary industrial changes. In Germany we have the melancholy spectacle of "The State" thrusting itself as a patron and director upon the voluntary associations formed for mutual aid by its subjects—associations which prospered under the frown of the Government, but which are now suffering from its officious favors.

One can understand why there may be, as there has been, an American Text-Book of the Practice of Medicine, as there might be an American Practice of Law, because climatic and sociological conditions differentiate American life in some degree from that of other countries. But just why, in the interest of pure science, there should be an 'American Text-Book of Physiology' is a puzzle. Nevertheless, there is. It is edited by Wm. H. Howell, Ph.D., M.D. (Philadelphia: W. B. Saunders), and is the product of collaboration by a number of American teachers. True, most of the numerous citations as to the recent progress of this science are foreign, and the only distinct omission we have observed that is important is reference to the investigations of Bergey, under the direction of Billings and Mitchell, upon the effect of rebreathing expired air, published by the Smithsonian about a year ago. But no editor is infallible. The presumed and probably the actual advantage of this method of constructing a class-book is the discussion of the same general subject from several points of view. Incidentally reflected light as well as that which is direct is cast upon it from the different outlooks of the confederated writers. This great volume, intended for pupils, is also useful for graduates who have not ceased from study; but carefully and intelligently as it is constructed, its thousand large octavo pages still leave unsettled some of the secrets of that organism which is so fearfully and wonderfully made.

The Hakluyt Society has published for its ninety-fifth volume the first part of Azurara's 'Chronicle of the Discovery and Conquest of Guinea.' The manuscript original was discovered in the Paris National Library in 1837, and is now first given in an English translation in commemoration of the fifth centenary of the birth of Prince Henry the Navigator, the promoter of the voyages narrated. These voyages, though nominally for discovery, were in reality little else than expeditions to procure slaves, and the success of a voyage was measured by the number of captives brought to Portugal. Though the chronicler is zealous in extolling the pious motives of the Prince in bringing these heathen under Christian influences, he is at times filled with a sense of the infinite pity of it. In a graphic description of the division of some slaves by the Prince among his friends, he says: "What heart could be so hard as not to be pierced with piteous feeling to see that company? For some kept their heads low and their faces bathed in tears, looking one upon another; others stood groaning very dolorously, looking up to the height of heaven, fixing their eyes upon it, crying out loudly, as if asking help of the Father of Nature; others struck their faces with the palms of their hands, throwing themselves at full length upon the ground; others made their lamentations in the manner of a dirge, after the custom of their country." The work of translating and editing has been done by Messrs. C. R. Beazley and E. Prestage, who have also added an account of the life and writings of Azurara. As an illustration of the ideas prevalent at that time regarding the geography of Africa, four maps are reproduced, of dates ranging from 1351 to 1436.

'Cow-boy,' by Auzias-Turenne (Paris: Calmann Lévy; New York: Brentano's), is a weak and insipid production, a sort of dime novel *ad usum Gallorum;* but one may fairly doubt whether any reader, native or foreign, will voluntarily proceed beyond the first page.

'Un Divorce,' by Th. Bentzon, a pseudonym that no longer conceals the identity of the writer, is the early work of Mme. Blanc. It is a pity, one cannot help thinking, to bring out, even in the case of great writers, their youthful works, or, at least, their first attempts at literature. In the case of writers of lesser rank (and it is not doing Mme. Blanc injustice to reckon her among these), there is no reason for it. The book, published by the above firm, is by no means up to the level of the author's later productions. Subject and treatment are alike commonplace, and the romanesque tone of the story does not suffice to make it interesting.

Very different is 'Idylle Nuptiale,' by Mme. Caro, from the same publishers. This is a well-written work, with interest enough in it to satisfy the average novel-reader and even the critical reader. Although the story begins suspiciously like the novels of the late G. P. R. James, it does not develop in the same fashion. Reality, as we understand it nowadays, since Flaubert and his disciples taught us, is pretty closely reproduced by Mme. Caro. There is an ample amount of suffering provided for the various characters, and a fair amount of verisimilitude for the reader. The characters themselves are well wrought out; they recall other and greater ones, but that is no fault—we can stand a remembrance of Grandet, in M. de Galesnes, and a vaguer one of Polyeucte, the *amant incompris*, in Gilbert Arradon. The common sense and cleanliness of the story are advantages not

always met with in the contemporary French novel.

A report on the "Philosophical Seminaries and the Present Condition of Philosophical Studies at the Universities of Berlin and Leipzig," by M. Élie Halévy, in the *Revue Internationale de l'Enseignement* for December, 1896, treats but briefly of the work of Profs. Stumpf, Dilthey, Paulsen, and Simmel, of Berlin, and Wundt, Heinze, Barth, Wolff, and Volkelt, of Leipzig. None of these is occupied with philosophy, taking the word in its full meaning—a symptom of the discredit into which philosophical, *i.e.*, metaphysical, studies have fallen in Germany ("Povera e nuda vai, Filosofia)." To this latter phenomenon, which has been discussed ere now by German as well as French scholars, the writer devotes the greater portion of his article. Its beginning dates back to the year 1816, when philology gained the ascendancy over philosophy in consequence of the new programme for the gymnasia. Aside from this lack of preparatory training, it is claimed, the prevailing idea that teaching philosophy in its widest sense—metaphysical theories—would be a violation of academical courtesy, inasmuch as metaphysics is a matter of private concern, has contributed to the decline of philosophy as a university study. This statement is attributed to E. von Hartmann. There are several points of interest in the article which we must refrain from touching upon.

In 1891 Jules Simon published a paper in the *Temps* on the population of France from a military point of view, in which he said: "We boast that we can send five million soldiers into the field. But how will it be in twenty years? We are losing a battle every year." The patriotic anxiety for the future of his country, so tersely expressed by the venerable French statesman, is fully justified by the latest tables of statistics, according to which the present population of France is 38,228,962, showing an increase of only 133,800 during the past five years. The annual increase from 1881 to 1886 was 113,000, from 1886 to 1891, 40,000, and from 1891 to 1896 only 26,760. This increase, small as it is, is due entirely to the growth of Paris and a few industrial cities in the provinces. In the agricultural districts there has been a considerable diminution of the population. But even in Paris the increase has been only 85,000 during the past five years, whereas in Berlin it has been 240,000 during the same period. In France the population has increased, in round numbers, from thirty six millions in 1872 to thirty-eight millions in 1896, and in Germany during the same time from forty-one to fifty-two millions; and this, too, notwithstanding the much larger emigration of Germans than of Frenchmen to foreign countries. During the past five years the population in the German Empire has increased 2,817,000; and in France, as already stated, only 133,800. At this rate Germany will have in 1910 a population of sixty and France a population of forty millions.

"Greater New York" is described in the last number of *Petermann's Mitteilungen* by the editor, Dr. Supan. The area and estimated number of inhabitants in 1898 are compared with those of London, Paris, and Berlin. The article is accompanied by a map giving the city and the country within a radius of 30 kilometres of the City Hall. In the same number are to be found the scientific results, with a map and meteorological observations, of the recent expedition of Prince Comanesti in Somaliland, and a paper upon the methods by which the geographical positions of places can be determined without the aid of astronomical instruments. Announcement is made that the subject of the annual prize of 25,000 francs, given by the King of Belgium for the most successful solution of some scientific problem, is: the conditions essential for the preservation of the health of Europeans in equatorial Africa, particularly in the Congo Basin.

The *Scottish Geographical Magazine* for December opens with a curious collection of nearly two hundred and fifty Gaelic place-names found in a single parish in Scotland. This is followed by a valuable summary of observations on bird migration in the British Isles, its geographical and meteorological aspects, by Mr. W. Eagle Clarke. There is also a description of the country of the Yakuts, taken from a recently published Russian work.

One of the most potent foreign influences exerted upon the intellectual and moral life of India is shown by a report of a year's work of the Christian Literature Society for that country. During the year, 149 new books and 89 new editions of books previously issued were published in thirteen different languages, including Persian. Most of the new editions and a few of the new works were school-books; the others were stories, biographies, scientific and religious books; fifty-two were treatises upon Hindu teaching and customs, social questions and duties. Of all these works more than one million copies were issued in the year, besides 130,500 copies of six vernacular periodicals. In addition to this work, the Society maintains a training institution for native teachers and 201 vernacular schools.

Mr. John Gifford now edits from Princeton, N. J., his monthly *Forester*, a pioneer in its class, with obvious claims for support in every part of the Union. It is the official organ of the New Jersey Forestry Association and is published at seventy-five cents a year. A characteristic view of the remorseless sand-dunes on the southern New Jersey coast is a frontispiece of the present number, which gives evidence of Mr. Gifford's late tour abroad.

By way of celebrating the hundredth anniversary of the building of that long-lived ship, if not longest-lived of ships still afloat, the *Constitution*, or "Old Ironsides," A. W. Elson & Co., Boston, have produced a large photogravure copy of Marshall Johnson, jr.'s painting of this frigate under full sail. The remarque is, we believe, a portrait of her second commander, Commodore Bainbridge. As Boston, in the person of Dr. Holmes, had a potent hand in preventing this historic war-vessel from being broken up years ago, it is fitting that a memorial like this plate should proceed from that city.

—An article which gives especial value to the January *Scribner's* is "Thackeray's Haunts and Homes," illustrated by sketches "worked out *in situ*," by Eyre Crowe. Five successive London homes exhibit the rising tide of Thackeray's literary success, and afford characteristic glimpses of the domestic architecture of the great city, while a familiar friendship, of early date and long continuance, supplies Mr. Crowe's pen with material as acceptable as that his pencil has found in scattered habitations on two sides of the Channel. A second article which has the merit of conveying distinct personal impressions—in this case of recent date and tinged with pity and indignation—is Yvan Troshine's "Bystander's Notes of a Massacre"—that of the Armenians in Constantinople in the closing days of August last. There is no war-cry here, however, to work author and attitude into favor with the tender-hearted and compassionate. The thorough organization, the business accuracy brought to a fine point, the application of talent and industry, composing the hidden and noiseless wheels upon which revolves in orderly fashion that apparent modern Bedlam, "The Department Store," are made clear to the comprehension of the multitude in an interesting illustrated description by Samuel Hopkins Adams. At the same time, there has not been overlooked, in considering the advantages of the great shops, a certain loss which the buying public suffers from the gradual disappearance of the retail dealer especially educated in his own line, and having a pride in his business to give it a distinction beyond that of mere trading. The store book-department furnishes the best illustration of this loss of a possible educational influence for the shopper.

—Time was when good Americans when they died went to Paris. Nowadays they ascend into English society, of which the final pinnacles are drawing-rooms, house-parties, and "the Marlborough House set." For this reason there is a chance that G. W. Smalley's article on "English Society" in this month's *Harper's* may do a good turn practically to departing or departed fellow-countrymen, by dropping the needful word to the wise in regard to nice points of behavior. Among the mere lookers-on in Vienna who find a spice in the ripened observations of a social philosopher, this paper will be sure to meet with consideration, notwithstanding the faint suspicion of snobbishness which it seems to be next to impossible for the writer who has nothing damaging or damnatory to say of social functions to avoid. But Mr. Smalley's article comes off with the merest possible suspicion, and preserves so well an upright poise on slippery ground that the most sensitive patriot might be trusted to read it and not feel moved to double up his fists at an effete monarchy. Most conspicuously clever of the remaining completed articles is a lively little comedy of lies, "Indian Giver." Here Mr. Howells, who is a past master of this side of feminine psychology, shows once more how witty a thing it is for a pretty woman to prevaricate recklessly, and, having precipitated a series of exciting *contretemps* by her prevarications, at last, like an early friend, the man in the bramble-bush, to retrieve herself by still more reckless prevarication.

—A suggestion is tentatively thrown out in the current *Atlantic*, in the article on "Park-Making as a National Art," by Mary Caroline Robbins, that there may yet be seen a park-way from the Atlantic to the Pacific, "leading from one beautiful pleasure-ground to another, and passing through great tracts of woodland patrolled by Government foresters." Far as we are from this, Mrs. Robbins is able to point to enough that has been begun in this country, by means of grants, gifts and purchases, to justify liberal hopes for the future. As a matter of fact, however, we must still look for achievement to the cities of Great Britain, and in particular to London, where an American authority finds there are already 209 football spaces in use. Joseph Edgar Chamberlin's "Memorials of American Authors" is written in a spirit of a praiseworthy aspiration for a country through which, without finding castles and

cathedrals, a Ruskin of the future may still travel and not feel his vital spirits wither; but the present showing which this paper is able to make, both as to quantity and quality of existing memorials, is discouragingly meagre. More forcible in thought and expression than anything else in this number is W. P. Trent's "Dominant Forces in Southern Life."

—Mr. Gilder's graceful poem in the *Century*, "The Parthenon by Moonlight," is coupled with a paper written with exceptionally intimate knowledge of what it deals with, by D. Bikélas, on "Public Spirit in Modern Athens." The wonder of this paper is the command of English displayed by a Greek, and not its least recommendation is the modesty of its statement and the common sense with which it invests the discussion of its subject. In Julian Hawthorne's "Summer at Christmas-Tide" it is necessary to pardon the raptures of a traveller new to the fascination of the coloring and climate of Jamaica, but this is readily done in view of the combined attractiveness of his theme and of his manner of writing about it. John Dutton Wright's admirably illustrated article on "Speech and Speech-Reading for the Deaf" marks a milestone in the progress of human intelligence and care for the afflicted. In considering the remarkable net result that there are to-day more than 2,500 deaf children in this country who "are taught as wholly by means of speech as the children of our public schools," no one should overlook the patience and genius of the teachers who have devoted themselves to this cause. Hamlin Garland's short story, "A Girl of Modern Tyre," is written in the vernacular which makes speech offensive to ears that are fortunate enough not to be accustomed to it, and which is no more attractive on the printed page than it is in the utterance. It may serve, moreover, as a warning against the excessive flatness into which indiscriminate realism may finally lead a story-teller.

—M. Léon Marillier, of the École Pratique des Hautes Études, has prefixed to his recently published translation of Mr. Andrew Lang's 'Myth, Ritual, and Religion' a noteworthy Introduction. The anthropological school, having driven others from the field, is now, he maintains, called upon for positive and constructive work in the history of religion. To account for the uniformity of savage myths and rites, he falls back upon something scarcely distinguishable from innate ideas. Why, he asks, are certain ideas savage and primitive? Why do primitive traditions too widely scattered to have a common derivation agree in reflecting identical conceptions and modes of feeling? What accounts for the startling monotony of all accounts of ultimate causes given by primitive peoples? There are certain traits inherent in the intellectual and emotional conformation of the primitive mind. There is, according to M. Marillier, a common religion belonging to human-kind, and it is based upon primitive modes of consciousness. Accordingly, the eighteenth century was not wrong in occupying itself with the "human mind," with an abstract man underlying all those picturesque local and individual traits that have so exclusively preoccupied the modern historical school. Yet M. Marillier does not allow of religion, what some assert of language, that it must necessarily be the involuntary and anonymous product of popular consciousness. A rôle remains for great religious innovators, and here again he is in agreement with the eighteenth century, but with a difference all in favor of recognizing as sincere many whom Voltaire and Volney called charlatans.

—M. Marillier contrasts religion and mythology, much as Robertson Smith has done, and agrees with Comte in making out theology and metaphysics to be later phases of thought, developed to cover the original ground of mythology. Comte forgot that all three phases might coexist, and he ignored religion as a mode of emotionalism, the impulse to worship, to seek union with the divine principle. Here, again, we are not far from the innate idea of God. This impulse towards worship, which M. Marillier regards as a mode of sensibility, is, according to him, the one thing in man's nature—whether he be primitive or civilized man—that requires mythology and ritual for its expression and satisfaction. Savage myths, identical the world over, were invented to satisfy this impulse, when with it were associated all the problems of the universe as presented to primitive man. For the savage, mythology was theology, metaphysics, science, and religion, all in one; but it had nothing to do with morality. This last point is rather startling, as some would say that savage morality centred in "taboos," which had a close connection with primitive myths and primitive rites. At all events, M. Marillier outlines the history of mythology as one of continuous differentiation. First, it parted company with theology, and took refuge from metaphysics and science in a close association with ethics. This last association has in these latter days been dissolved, our writer affirms, but the old myths survive. Indeed, they persist in men's minds, not, as of yore, because they answer our questions of doubt concerning the world and ourselves, but because, transformed, as they now are, into symbols, they are the indispensable word-counters required for our own interpretation to our own selves of our own religious emotions.

—The annual public celebration of the Higher Courses for Women, connected with the University of St. Petersburg, took place on December 13, and the reports from all departments showed that the cause of higher education is constantly making progress in Russia. Two new chairs have been established during the past year, viz., zoölogy and the history of pedagogy. At the beginning of the year there were 695 regular and outside students: in the historic-philological department, 506 students, and 56 outside attendants; in the physico-mathematical department, 122 students and 11 outsiders. 101 dropped out, for various reasons, and only 80 graduated in both departments. The applications for entrance for the current year were made in August and September last, and far exceeded the available vacancies, as has regularly been the case every year; 550 applied, but only 226 could be received, and most of these were students who had finished the courses in the middle-class educational institutions with the gold or silver medal, and with the certificate allowing them to give private lessons. It was necessary to refuse the rest, although many of them came from distant parts of the country, Eastern Siberia, Bulgaria, and so forth. At the present time there are 673 students and 68 outsiders, of which number 596 are in the historic-philological department, 101 in the mathematical, and 44 in the chemical. The students of the different departments made excursions that they might study on the spot distant historical monuments; and to places in Finland which offered opportunity for original investigation of physical subjects. The library of the Courses contains 14,758 volumes, under 6,262 heads. In order to facilitate the study of astronomy, the guardians suggested that a small revolving observatory be built, and instruments for making observations be bought, and such an observatory is nearly completed. The Courses also possess the nucleus of a Museum of Fine Arts, in the form of several hundred photographs from architectural subjects and from sculptures, chiefly Italian. The financial part of the report announces that the receipts for the year were 105,985 rubles (about one-half that sum in dollars), of which 54,152 rubles was expended on the educational part, and 33,275 on the support of the students who live in the three houses maintained by the Courses, and in which all women who cannot reside with their parents or relatives are compelled to live. Of such women there are now 168. The limitations of these dormitories are the chief cause of disappointment in candidates from distant places. That is gradually being remedied since the experiment, begun with one house a few years ago, proved so successful with its very moderate charges for comfort and the indispensable protection afforded. At the end of this annual commencement the graduates received their diplomas.

MAHAFFY'S PTOLEMIES.

The Empire of the Ptolemies. By J. P. Mahaffy. Macmillan Co.

PAUSANIAS, writing in the second century of our era, gives as a reason for his brief digression on the Ptolemies that the popular report of them had vanished, and that the contemporary records of their reign were neglected. He could write this only two centuries after the death of the famous Cleopatra. It is no wonder, therefore, that our sources are now meagre and fragmentary. The episodes of Polybius, of Diodorus, of Plutarch and Pausanias must be supplemented with the inscriptions and the fragments of papyri which modern discovery is constantly contributing; and in this flux of isolated facts and documents it is hard to find beginning or end. Mr. Mahaffy does not profess to find an end; yet his treatise must certainly hold the field for a long time, so far as the English language is concerned. He has pieced out his mosaic with great special learning and pains, and has added many new touches to the picture. A good instance of these recent additions to our knowledge, which are confirmed by the evidence of the latest papyri, is, that we now reckon a Ptolemy VI. (Eupator) and a Ptolemy VIII. (Philopator Neos), who were divined but hardly proved by the acute and learned Lepsius.

Mr. Mahaffy begins his work with the conquest of Alexander, which did in fact open a new era for Egypt and its history. He points out the combination of good fortune and good judgment with which the great conqueror propitiated and won over to a certain extent the stubborn and disaffected element in Egyptian society. The Persians, beginning with Cambyses, had outraged the Egyptian priesthood, a powerful and ambitious body, and had incurred their unceasing enmity; Alexander, on the contrary, won their support and their sentimental influence with the populace, just as he had won, by judicious concessions, the priesthood at Jerusalem and the important services of the migratory and commercial Jews. Ptolemy Soter inherited the outlines of Alexander's policy in Egypt, as he had managed to secure for the nascent Alexandria the prestige and sanctity of retaining

in the Sema those magic relics in their golden sarcophagus for the possession of which Perdiccas had disputed. He contributed magnificently to the burial of Apis, which Cambyses had insulted and desecrated; he granted lands to the domain of the gods Pe and Tep; he built temples at Edfu, at Esneh, and at Denderah, so purely Egyptian in their symbols and architecture that they were long supposed to belong to the older Pharaonic dynasties. By such concessions he gained the active support of the national hierarchy, and their vast influence over the fellahs, whose lot, then as now, was unceasing labor under the kurbash of the tax-gatherer. He even seems to have invented, with the aid of Greek and Egyptian priests, a new guardian deity for his new capital—a mongrel fusion of Sarapis with the Greek Hades, which suited well the mixed elements of that growing population.

In the government of the city, which became the Paris of the Hellenistic world, this ruler made a novel departure from the conceptions of Alexander and from the Greek ideas of polity. It was not self-governing, according to the Greek idea of the *polis*. Its citizens had, indeed, certain exemptions and privileges; but they remained subject, under military control, to a centralized empire which Ptolemy had the original genius to devise and establish. His statesmanship, like that of the other Diadochi, was Machiavellian, but tempered and prospered by a combination of prudence, moderation, courtesy, and bonhomie, which was purely personal and individual. To this remarkable group of qualities his successors owed the stability of the empire. The debt which the modern world owes him is of a different kind, and far more important. With the aid and counsel of Demetrius of Phaleron, he founded the Museum, that earliest university of learning, and made a beginning of the famous library. To his patronage we owe the corps of bookworms and critics and grammarians who preserved for us the Greek classics; to him, probably, more than to his son Philadelphus, we are indebted for the names and the works of Theocritus and Aratus, of Euclid and Herophilus.

The city itself was the earliest great and gay capital of the civilized world—the model of Rome in after times, replete with luxury and magnificence, with architectural adornment and artistic beauty. Mr. Mahaffy maintains, and we must agree with him, that the treasures of art collected in that wealthy capital were second only to those of Athens and its Acropolis. In later days, its architecture and painting set the fashions to Rome and Pompeii and Herculaneum. A unique sample of the best art of that period has come down to us in the magnificent polychrome sarcophagus now preserved in the new museum of Constantinople. It is the greatest of pities that we must apparently renounce the hope of recovering such treasures. If not plundered and carried away, they lie buried ten feet below the present water-level, in consequence of a general subsidence of the soil which was revealed by the recent excavations undertaken for the Hellenic Society.

We have spoken of Alexandria as a sort of Paris, visited for its splendid fêtes by the rustic world of Greece and the Ægean islands, such as those lively ladies whose chatter Theocritus immortalized in his fifteenth idyl. It bore a curious resemblance to the modern Paris in another respect. The Alexandrian mob was as capricious, as brutal in its outbreaks, as powerful in swaying the destinies of the Empire, as the supporters of the Commune. The pétroleuses were not more outrageous than the troop of young girls who, Polybius informs us, tore in pieces the wife and infant child of Philammon.

The policy of centralization which was invented by the first Ptolemy was continued by his son Philadelphus. The Revenue Papyrus of the twenty-seventh year of his reign, discovered by Mr. Petrie, contains the most minute regulations as to the taxing of vineyards and wine and oils and fish. The prices, the number of acres to be cultivated, the number of retailers, were all fixed by the State; the seed was distributed by the State sixty days before the harvest. The minute detail of these regulations, borrowed from the Pharaohs, reminds us of that crushing system of restriction which prevailed in the Byzantine Empire and is disclosed in the "Book of the Prefect," the municipal code of Leo, "the Wise." There were tithes and twentieths and sixths—there was a salt-tax, a police-tax, a dyke-tax, an orphan-tax. Inheritance-tax, apparently, there was none; but this might well be omitted, since every field and every plant was catalogued and assessed during a man's lifetime. There was a swarm of officials and a deal of red tape under this complicated bureaucracy; but there were no outrages or horrors of the type which introduced the French Revolution. The papyri prove that, in the main, justice was done by the crown magistrates, and life and property were secure. The State regulations did not preclude a considerable measure of freedom in commerce, in the transfer of property, and in the provisions of wills. The Grenfell papyri, published since Mr. Mahaffy's book was printed, give remarkable confirmation of this fact. Within our own day, under the Khedive Ismail, the fellahs were more oppressed than were the subjects of the Lagidæ or the Seleucidæ.

Early in his reign the second Ptolemy took the extraordinary step of marrying his own sister, Arsinoe, called from that fact Philadelphus, "the lover of her brother." This incest offended Greek sentiment, but was entirely in accord with Egyptian ideas and with the Oriental expressions of the Song of Songs, which was probably composed in the Alexandrian epoch. Droysen ascribes the choice to motives of policy; Mr. Mahaffy assumes also more potent influences. It is quite likely that Ptolemy was in love with his sister. Arsinoe was ambitious, she was strongly intellectual, and probably a woman of great personal charm. "She wanted only another Plutarch and a Roman lover to make her another Cleopatra." She won great popularity, and, before her death, had received the tribute of deification in all the Egyptian temples. This deification was no barren honor. The Revenue Papyrus lets us into the secret of what it really meant. It contains a royal order by which the tithes (or rather the sixths) due to the temples were made over to the patron goddess, Arsinoe Philadelphus. In compensation for this ingenious form of confiscation some moderate allowances were made to the priesthood.

The latest successor of Arsinoe was the Cleopatra of Plutarch and of Shakspere, no gypsy "with Phœbus' amorous pinches black," but heir of the purest Macedonian blood and features—heir, apparently, of all its force and graces, without diminution or deterioration; yet four of her direct ancestors had married full sisters. Many years ago Mr. G. H. Lewes cited this remarkable woman as a disproof of the common belief that intermarriage of near relations necessarily produces physical degeneration. The Arsinoes and the Cleopatras were, in general, stronger than their husbands intellectually, but quite as unscrupulous, as destitute of the ordinary feeling and decencies of humanity. It is not easy to guess what flesh and blood these women were made of who were ready to sacrifice everything to ambition, to whom a Manon Lescaut might be a type of modesty—one of whom, it is asserted, lived and bore children to a husband who was at once her own brother, the murderer of her son, and the husband of her daughter. The myth of Œdipus hardly embraced such a catalogue of monstrosities. Mr. Mahaffy speaks of the mimes of Herondas as probably overdrawn in their realism—overdrawn *à la* Zola. That may possibly be. But the tone of the mimes strikes us as exactly fitting the court of the Ptolemies. The high moralities which Pindar administered to his princely patrons have disappeared from this literature. By Theocritus such matters are gracefully ignored; for Herondas they hardly exist. He sketches his rather sordid types with undeniable art, but with a hard and cynical humor which is truly Mephistophelian. This Mephistophelian cynicism is the keynote to the court of the Ptolemies.

It would be a great mistake, however, to believe all that we are told of these sovereigns, or to imagine that the country suffered in proportion to their scandalous reputation. The evidence of the papyri proves this to a demonstration. The historians have served up the name of Ptolemy Physkon (Euergetes II.) with a *sauce piquante* of incredible crimes and cruelties, among which is the murder and mutilation of his own son as well as his sister's. Yet this "Tamburlaine" reigned nearly thirty years over a fairly prosperous people, and contributed a curious emendation to the 'Odyssey.' There is, in fact, neither rhyme nor reason in the chapter of horrors that is narrated of him; the contemporary documents do not bear them out, and Mr. Mahaffy does not accept them. He believes, with great probability, that they were partly invented by the Jews and Greeks whom Euergetes banished in pursuing a national or Egyptianizing policy, and who took this literary revenge upon his memory. As to the character of his government, we have the remarkable testimony of the Turin papyrus, which records, in nine columns, the evidence and the decision *in re* Hermias vs. the Choachytæ, a litigation over a piece of real estate in the fifty-third year of Physkon's life. The evidence goes back for eighty-eight years—the public records for that period are cited; "the arguments and the decision are such as would now be used in an English court." The decision, we may add, was rendered within a month of the hearing. A single case of this kind goes far to countervail the verdict even of Strabo and Polybius.

The steady growth of an Egyptianizing policy can be traced in the ample citations which Mr. Mahaffy makes from papyri and inscriptions, a feature most welcome to the scholarly reader who is not a specialist. Chief of these are the decree of Canopus under Ptolemy III. (238 B.C.), and the decree of Memphis in the Rosetta Stone (196 B.C.). Every one has heard of the Rosetta Stone and its relation to Champollion's discovery. Many have seen it in the British Museum; very few know what it is all about. Mr. Mahaffy here gives the Greek text in full with annotations, in order to show the relations of the Government to the priests and the native population. Like the decree

of Canopus, it contains a complimentary vote of the Egyptian priests to the reigning King, recording certain conquests and public works, acknowledging certain favors received and conferring certain honors. But the language of the later decree reveals the progress which the stubborn Egyptian element had made in conquering its conquerors. It is thoroughly Egyptian in its long-winded titles and phrases and whimsical formulas of flattery.

BANKS'S JOURNAL.

Journal of the Right Hon. Sir Joseph Banks, Bart., K.B., P.R.S. Edited by Sir Joseph D. Hooker. Macmillan Co. 1896.

It is probable that many of our readers are already acquainted with parts of this journal, although they may not be aware of the fact. Those who have perused the account of Capt. James Cook's voyage to the South Seas in the ship *Endeavour* remember how much of the interest was plainly due to the vivid descriptions of natural scenery, of the natives and their ways, and of the plants. A good measure of this interest came, not from what Cook himself wrote, although Cook's style is graphic and full of vigor, but from material which his editor appropriated, under authority, from the journals of Cook's scientific companions. This material was inextricably blended with Cook's own words and with the editor's fine writing.

This blending of incongruous matters happened in the following way. On Cook's return, his journals, together with those of his scientific associates, Banks and Solander, were intrusted to Dr. Hawkesworth for publication. A note in Prior's Life of Malone says: "Hawkesworth, the writer, was introduced by Garrick to Lord Sandwich, who, thinking to put a few hundred pounds into his pocket, appointed him to revise and publish Cook's voyages. He scarcely did anything to the MS., yet sold it to Cadell and Strahan, the printer and bookseller, for £6,000. . . ." But Hawkesworth, instead of doing scarcely anything, as this note would lead us to believe, did really too much; he brought rather too much of his own heaviness into the narrative, and, after the common fashion of that day, took here a little and there a little of just what served him best, without providing the student of his pages any sufficient data for determining exactly what was Cook, what was Banks or Solander, and what was Hawkesworth. With the means now at command, it is possible to ascertain at least what were the respective contributions of Cook and Banks. Cook's Journal, freed from extraneous matter, was carefully edited, in 1893, by Capt. W. J. L. Wharton, R.N., Hydrographer to the Admiralty, and now we have before us the Journal which was kept by Banks.

This has likewise received careful editing, also at the hands of competent authority. Captain Wharton was admirably fitted to consider Cook's Journal from the point of view of modern navigation and of hydrography; Sir Joseph Hooker, the most eminent living botanist, an all-around naturalist, interested in everything which can fall under the eye of a scientific traveller, and familiar with much of the ground visited by Banks, is the one to whom the task of editing this Journal would naturally be committed by common consent of the learned world. But there is an added felicity in Sir Joseph's acceptance of this task in the fact that it is to one of his relatives that we are indebted for the preservation of the Journal itself. Sir Joseph states in the preface that:

"On Sir J. Banks's death without issue in 1820, his property and effects passed to the Hugessen [his wife's] family, with the exception of the library, herbarium, and the lease of the house in Soho Square. These were left to his librarian, the late eminent botanist Robert Brown, F.R.S., with the proviso that after that gentleman's death the library and herbarium were to go to the British Museum. Banks's papers and correspondence, including the Journal of the voyage of the *Endeavour*, were then placed by the trustees in Mr. Brown's hands, with the object of his writing a Life of Banks, which he had agreed to do. Age and infirmities, however, interfered with his prosecution of this work, and at his suggestion the materials were transferred with the same object to my maternal grandfather, Dawson Turner, F.R.S., an eminent botanist and antiquarian, who had been a friend of Banks. Mr. Turner at once had the whole faithfully transcribed, but for which precaution the Journal would as a whole have been irretrievably lost."

It appears that when the manuscripts had been copied, they were placed, after one or two transfers, in the manuscript department of the British Museum. Mr. Carruthers, F.R.S., late keeper of the botanical collections at the British Museum, says, in a letter to Sir Joseph Hooker, dated July 14, 1893:

"The story of the originals, after I parted with them, is a distressing one. Some seven or eight years ago Lord Brabourne claimed the letters as his property. Mr. Maunde Thompson remonstrated, and told him that they were to remain in the Museum till the death of Lady Knatchbull, and then they were to become the property of the trustees. Lord Brabourne would not accept this view, but claimed them as his own, and carried off the box and its contents. They were afterwards offered to the Museum for sale, but the price offered by the keeper of the manuscripts was not satisfactory, and the whole collection was broken up into lots, 207, and sold by auction at Sotheby's on 14th April, 1886. The Journal of Cook's voyage was lot 176, and was described in the catalogue as 'Banks's (Sir Joseph) Journal of a Voyage to the Sandwich Islands and New Zealand, from March, 1769, to July, 1771, in the autograph of Banks.' It was purchased by an autograph dealer, John Waller, for £7:2:6. . . . I have since ascertained that the Journal came into the possession of J. Henniker Heaton, Esq., M. P., who informs me that he disposed of it to a gentleman in Sydney, N. S. W. The result is that the Journal and letters transcribed for Dawson Turner, and now here, are the only ones available."

Thus, by the happiest chance, the editing of an authentic transcript falls to the grandson of the thoughtful man whose foresight saved the Journal to science.

The Journal is well worth saving. It is the graphic account of daily adventures and explorations by a naturalist who engaged with his whole might in his work. His companion, Daniel Carl Solander, a Swede and a pupil of Linnæus, entered heartily into all the plans of Cook and Banks, and, after his return, became the secretary and librarian of Banks. The voyage carried these three well-equipped explorers first to Madeira and thence to Rio de Janeiro, at which port the authorities gave them much trouble. The Viceroy was suspicious that the Whitby-built bark of three hundred and seventy tons was not really a king's ship of war, but a smuggler, and the crew was forbidden to land. Remonstrances were of no avail. On the 21st of November, 1768, Banks was informed by the Viceroy that it was not in his power to permit him to go ashore. The entry on the 26th is very characteristic of the man:

"I myself went ashore this morning before daybreak, and stayed till dark night. While I was ashore I met several of the inhabitants, who were very civil to me, taking me to their houses, where I bought stock for the ship tolerably cheap."

Banks then proceeds to give a clear sketch of the natural features of the place, together with some account of the gardens and fields, the government, religion, and manners. Yet he did not once set foot in the city. His diligence during his clandestine examination of the suburbs may be partially realized when we note that he made a list of 316 plants near Rio.

From this inhospitable reception by the Portuguese, the ship sailed to the even more inhospitable region of the Cape. At Tierra del Fuego, an exploring party from the ship had a terrible experience in the birch-scrub. Banks, Solander, and a few others tried to ascend a mountain some miles from the shore, but they became benumbed by cold, weakened by hunger, and finally lost in the snow. Two of the servants were frozen to death, but the rest of the party came back enfeebled. In a couple of days Banks was again at work with his plants and with his studies of the natives. So that, from the first, we see this wealthy Englishman, who might have led a life of elegant leisure in his library, entering with keen zest into every phase of adventure, taking risks, suffering hardship, apparently with the single aim of adding to the sum of human knowledge. In these days of accumulating wealth we have here the lesson of Banks's Journal. Banks made his fortune fruitful.

From Cape Horn the ship sailed to Tahiti, where Banks employed his time assiduously in collecting illustrations of natural history and in a careful study of the natives. The descriptions are uncommonly spirited, and the conclusions drawn from his observations are generally just. The modest accounts given by him of his part in the daily toil convince the reader that he must have been an admirable companion for such a perilous voyage. There is a vein of humor running through the narrative which lends a great charm to the whole.

New Zealand and the east coast of Australia were next visited, almost every point and bay and river referred to taking its name from some adventure. Banks brings the narrowly escaped dangers, the shipwreck and the partial repair, the drifting in the Coral Sea, and the overhanging cloud of illness, almost too vividly before us. Then comes the voyage of the disheartened to Batavia, the recital of discouragements, and finally the return. Through all the Journal there is kept a sense of proportion which makes it stand as a marvel of sound readable record.

To Wharton, who has rescued Cook's Journal, and to Sir Joseph Hooker, who has rehabilitated Banks's Journal, the sincere gratitude of all who like the true story of maritime discovery is due. There are two other journals which keep coming constantly to the mind while reading the Journal of Banks and the Journal by Cook — namely, that by Darwin, and the notes by Sir Joseph himself in his great treatises on the plants of the South Seas. A spirit of truthfulness and of self-sacrifice in the highest cause pervades them all.

Totem Tales. By W. S. Phillips. Chicago: Star Publishing Co. 1895.

A worth considerably beyond any promise of its illustration or of its English inheres in this collection by simple merit of its genuine-

ness. These are mostly real Indian stories, and, with a few easily detected exceptions, antedate the missionaries. But emphatically they are not "Indian stories, Indian told," as the author fancies. With his sincere if untrained feeling, he might have come near to a real eloquence if he had had precisely the Indian genius of restraint. The aborigine, whatever his other failures, never gets drunk with the sound of his own voice. Mr. Phillips has properly told and retold to his own civilized babies versions of these tales picked up by him among the tribes of the North Pacific Coast, and very lamentably has retained in his book the knee-high attitude of narration. For this, quite as much as for its slack grammar, his literary vehicle is most unsatisfactory. A sustained falsetto is the last tone fit to be used in any putative rehearsal of Indian speech. The nomenclature is shockingly mixed and undigested. How entirely the Indian names are *not* "pronounced just as they are written" here is conclusively shown by the author's own appendix. Most of the illustration is equally grievous to the judicial, and suggestive of the chopping-block. Yet the artist (who is the author) has sometimes an actual inspiration in a tailpiece or touch which is at once Indian and decorative, fairly suggesting the one venture (and success) of George Wharton Edwards in a comparable field.

Yet, despite its verbiage, its sorry grammar, its prevalent scragginess of illustration, and total lack of phonetic system, we could better have spared a better book. The vital fact is that Mr. Phillips has caught and with reasonable accuracy transcribed for us a number of "Chinook" folk-tales; rescuing them none too soon from the disintegration which is so fast destroying primitive folk-lore in all the Americas. It is the first step that costs, now. Time and the men abound for giving the salvage its due literary form and its appraisement in science.

Driving for Pleasure; or, The Harness-Stable and its Appointments. By Francis T. Underhill. D. Appleton & Co. 1896.

THIS is a sumptuous book bound in kid and "suede," printed on thick paper with wide margins and double leads. It is studded with illustrations, to the extent of 124 full page plates. Many of these would grace the catalogue of a wagon-shop. In turning the leaves of this volume, one is reminded of a burlesque Venetian sketch which, on large tinted paper, with an excellent silhouette of the city of St. Mark and an artist's gondola in the foreground, bears this legend:

> "You can bet your bottom dollar
> We are onto this Venice caper:
> A little paint, a little work,
> And lots of empty paper."

But this is only one side of the case; for, while the forty odd thousand words could go easily into a vest pocket volume, and while there is a superabundance of the photographs of vehicles, the text is sensible and good. The real pictures are admirable, and the sumptuosity well befits a book intended mainly for those who make the driving of "correct" turn-outs a high purpose of their lives. A man who goes about the streets with a ton of coach, four fine horses, and a couple of stalwart grooms, ought not to read a book that would go into any pocket. Unless he has had a groom's training, he can hardly be sure that his appointments are like every one else's in the absence of illustrations like these to guide him.

To the observer of social customs nothing is more curious than the dead level of uniformity to which all horsey things have been brought by those who use the show drive-ways of American towns and summer resorts. There is one right way in which everything is to be done, in any particular year, from the head-stalls of the leaders to the hind boot of the coach. Correct style is simply a close adherence to the prescription of the moment. Unless we know the coaching man personally, it is impossible to determine whether he is a gentleman or only a rich man. However, this is the fashion of the hour in this land of independence and liberty, and we have no fault to find with it.

There are men among the owners of modern turnouts who are good horsemen, and who are wise lovers of good horses, and Mr. Underhill is one of them. Those of us who cannot indulge in all the elegance he dangles before our wistful eyes, may still find stimulus for our imaginations in what he shows us, and especially in much that he tells us. This, for example, is his account of a good coachman:

"A head coachman becomes such after years of hard training under a master (either professional or amateur) who is thoroughly posted, and then only when he possesses a suitable temperament, hands, receptive faculties, application, and appearance, together with the ability to manage men, and the education necessary to the keeping of his accounts, etc. While, of course, those needing a servant so well qualified as a head coachman should be are not numerous, they are sufficiently so to warrant a sketch of some of the training which such a man must undergo.

"Beginning in his boyhood as exerciser, and later as a breaker of colts to saddle, he goes through a hard and somewhat rough school, his instructor probably being considerable of a martinet. Then, selected from among several others of his kind, he is advanced to the harness stable, where for some time he is made generally useful, and is familiarized with the minor details of stable duties; he is taught how to walk smartly, and not with the slouchy step of the plowboy, and how to put a certain snap into his way of doing his work. By degrees, as a strapper, the cleaning of horses, harness, carriages, saddles, bridles, leathers, and all the incidental and additional duties are mastered, and he commences his career as a groom in livery. In this capacity he has to learn a great many little niceties as to the proper way of filling the positions of tiger, carriage, and pad groom. These qualifications mastered, he is passed to the degree of under-coachman, and then, if he is to be further advanced, he must be sufficiently interested in his work to learn the practical care of a horse, his feeding, treatment, etc., in case of sudden sickness (and before a veterinarian can be summoned); he must look into horse-shoeing from an intelligent standpoint, so that he can advise with the farrier as to the correction of some defect in balance or in action; he must be well posted in mouthing and bitting as applied to horses of different temperaments; he must know how to harness his horses properly, and how to drive a single horse, a pair, a tandem, or a four, in a finished and workmanlike manner, and, finally, he must not use liquor to excess. How true the maxim is, that 'a coachman is born, not made'; for with all the requisite making here outlined, the number of men with the keenness and ability to profit by such training is extremely small."

Concerning tandem driving our author says:

"Tandem driving is a most delightful sport, and productive of a great deal of skill on the part of the man who practises it constantly and with a variety of horses. It seems to be somewhat of a fad with coaching and four-in-hand men generally to affect to despise a tandem as beneath their dignity. Such an affectation is absurd, for tandem driving requires the consideration of many points which do not exist in the driving of four; and although the latter sport demands more finished horsemanship as a whole, tandem driving furnishes a field for practice, and the use of hand and whip, which are most valuable to a coachman.

"When one has, for example, two highly strung horses with sensitive mouths which are new to tandem work, he has really one of the prettiest opportunities for the display of finished workmanship and hands, if he would bring these horses to their work properly without the constant assistance of his groom."

There is an old English saying that the seat on horseback makes some men look like gentlemen and others like grooms. The groom-act is thoroughly well done by the rider on the cockhorse—to Banbury Cross—in the frontispiece.

Studies in Ancient History. Second Series. Comprising an Inquiry into the Origin of Exogamy. By the late John Ferguson McLennan. Edited by his widow and Arthur Platt. Macmillan Co. 1896. Pp. xiv, 505.

UNDER any precise terminology this title suggests a paraphrase of the somewhat famous schoolboy composition: "It is hard to study ancient history, because there isn't any." A definition of "history" which might justify this sincere and laborious volume would have to blink the last twenty years and their enlightenments. Dr. McLennan's researches along the lines of human accretion and crystallization are long known. His 'Origin of Marriage' was published in 1876 and again in 1886; a scholarly treatise, as is this "second series," and with the same generic weakness—complete lack of schooling in the field. Such treatises nowadays are measured beside Lewis H. Morgan's demonstration of the classificatory system of aboriginal relationships, the broad conclusions of which have been proved inexpugnable in every field scientifically tested. As all who followed the old controversy know, Dr. McLennan was never able to understand that system; and even in this posthumous volume he continues to protest against the inevitable.

It is again the irrepressible conflict between the closet student and the graduate from the same curriculum plus field-knowledge. There is much curious reading here for such as are aware of the direct work, in the American field, by a small but devoted band of scholars from Bandelier and Matthews down, in the last fifteen years. It would be ungenerous to lay specific blame at Dr. McLennan's door. He had no personal touch with any human remnant from ancient history; and, so far as he is concerned, the present work is seriously fragmentary. The editors frequently confess how unfinished he left the material; had his life been spared he might have made radical changes.

The "ancient history" he had to be content with was of course—and almost without exception—modern accounts of peoples who more or less remain of primitive habit. Nearly all the testimony upon which his theories are based is the inexpert observation of sailors, travellers, and missionaries. Lafitau and other Jesuits, the Franciscan frailes, the Langs, Livingstons, and Calverts—these were honest men. Probably Garcilaso de la Vega, the Inca Pretender, is the only authority quoted who had a specific inducement to falsify, and did falsify. But not one had the ethnologic equipment, and not one was on an ethnologic mission. Curiously enough, the only scientific authority of first rank quoted in this work is the only source the author has seen fit to ridicule. He clearly aims to be judicial, and of many witnesses he detects the incompetency; but his is the fate of his environment, and while he can digest Lafitau and Schoolcraft, he strains at Morgan. As

one lists and ponders the cloud of witnesses, the wonder grows that so serious a structure should have been raised upon the like sands. If exogamy had awaited establishment at such hands, it would be guesswork still.

The exact value of unaimed observation could hardly have more graphic demonstration. Not to follow the author through all the aboriginal kingdoms of the earth, his divisions relative to the Americas are (when we remember the toil that has gone to this volume) barely short of pitiful. On the authority of H. H. Bancroft's consensus of reporters, and of less culpable (because earlier) conjecturers, he has assembled perhaps the most remarkable mass of error as to Western and Southwestern tribes that has found place in so serious a volume. Nothing could well be less on a level with our present knowledge than his statements as to the Moquis, the Navajos, the Southern Californians, and the Zuñis (who seem to be classed as of Mexico). That "the New Mexicans are polygamous; they acquire their wives by purchase"; that "the Pueblos also get wives by purchase"; and equally generic blunders touching Mexico, Central America, and Peru—these would be in themselves enough to discredit his witnesses in mass.

For so conscientious a student there can be but one feeling, however much astray Dr. McLennan's conclusions are. But there may fairly be doubt if his literary executors have dealt wisely or fairly with his memory in publishing these unfinished notes of a work which the times have outstripped.

Introduction to Public Finance. By Carl C. Plehn. Macmillan. 1896.

PUBLIC finance, according to the author of this treatise, is properly called a science for a number of reasons, the last of which is that "it is generally, if not universally, so regarded." Perhaps this should settle the question, and if a body of customs that have grown up without reference to any consistent principles can be called a science, the methods by which governments obtain revenue are no doubt scientific. However this may be, it is certainly possible to describe these methods, and this is attempted by Prof. Plehn with a considerable degree of success. He considers it important to begin with an account of public expenditure, which he divides into expenditure for the common benefit and expenditure for the benefit of individuals. It is somewhat paradoxical to find that the expense of maintaining the House of Representatives in the Fifty-second Congress, some $5,000,000, falls under the head of expenditure for the common benefit, although it would not be easy to prove that the expenditure of this money did good to any one except those who received it. But the paradox may be explained if we remember that, according to political theory, the House of Representatives exists for the common good, and that for the purposes of classification the truth of this theory must be conclusively presumed.

The sources of public revenue are of course chiefly taxes. Fees bring in no inconsiderable sum, and the income from the business operations of government is in modern times of increasing importance. Prof. Plehn is careful in his distinctions; but they are after all of merely technical importance. They have been painfully worked out by German writers, and introduced by some American professors into their lectures and essays, but they have no relation to the proceedings of our legislators. The science of finance as constructed by these students is purely esoteric, and we might almost say that it is constructed to suit their own political ideals. It would be easy to show that it has but the slightest economic basis, and that it ignores the existence of the most formidable dangers to society. Prof. Plehn, it is true, declares that he concerns himself only with what is, and not with what ought to be; he attempts to maintain a position on "the high plane of scientific impartiality." But the attempt is futile, and it would be futile whoever made it. In this writer's case we see at once that he has been captivated by the system elaborated by the Prussian theorists, and that he, to some extent unconsciously, estimates schemes of taxation according to their relation to his ideal. He complacently observes, for instance, that "the hopes of reformers all centre in the income tax"—a statement that could scarcely be made by any one thoroughly familiar with American sentiment.

A considerable part of this treatise is devoted to an account of the growth and forms of public debt, and to an explanation of some of the methods of fiscal administration. We observe nothing here, however, that calls for particular mention. It should be said that the author declares his intention to produce only an elementary text-book, so that we may not justly complain of its lack of completeness. On the whole, if we regard it as a brief dictionary of fiscal institutions, it is not without value; but in this point of view much of it could have been omitted. The style is generally clear, but occasionally marred by defective English.

Genealogical Record of the Hodges Family of New England, ending Dec. 31, 1894. 3d ed. Compiled by Almon D. Hodges, jr. Boston: Frank H. Hodges. 1896.

WE are inclined to regard this work as almost a unique example of reëlaboration in genealogical literature. One edition commonly suffices to exhaust the strength, zeal, and purse of the unrequited author of a family history, but here we have a third, based by a son upon his father's continuation of the original "small duodecimo of 22 finely printed pages" published in 1837 by Rufus Hodges in Cincinnati. This pioneer was linked to his immediate successor as a some-time instructor, and as a kinsman in the Taunton branch—much the larger of the two grand divisions of the family; the Salem branch being the other. Another singular and (to the searcher) by no means encouraging circumstance is the appearance in our early annals of a number of persons who, in the mixed spelling of the age, were confounded with each other as Hedge, Hedges, Hodge, Hodges, Hogge, Hogg, and even Hodgkins, with an occasional deliberate change on the owner's part from one of these names to another. The clearing up of this tangle, so far as it was possible, was the first task of the present editor.

In respect of allied families there is no comparison between the Salem and the Taunton branches. The historic fame of Essex County, Mass, is here supremely represented by Derby, Ward, Ingersoll, Bowditch, Crowninshield, Choate, Manning, with a loan of Quincy and Russell from Boston. On the other hand, numbers tell in favor of Taunton when Mr. Hodges musters, in an appendix, the participants in the Colonial, Revolutionary, and Civil wars. To this list he admits both Hodges and non-Hodges, and the genealogy as a whole is remarkable for the fulness with which it portrays those who do not, as well as those who do, bear the family name. Women, again, who marry and become parents, enter into the numbered scheme and have their separate biographies. There is often a noticeable particularity in personal description which does much to make this record readable. Finally, the indications of generation and direct ascent are in accordance with the most approved method, while the index is a marvel of completeness and intelligent painstaking. Mr. Hodges even goes so far as to star the pages in which a given name figures more than once.

The Puritan in England and New England. By Ezra Hoyt Byington, D.D. With an Introduction by Alexander McKenzie, D.D. Boston: Roberts Brothers. 1896. Pp. xl, 406.

IN this handsomely printed volume Dr. Byington has gathered together, after having rewritten and brought them into close relationship, a number of papers designed, in their original form, for publication in a monthly periodical or for presentation before historical societies. Though knit together into a fair degree of unity, they bear evident traces of their original purpose. The opening chapter, entitled "The Puritan in England," is a rapid survey of Puritanism in the mother country to the era of the settlement of New England; but the collection, as a whole, forms not so much a history of Puritanism as a series of glances at various aspects of Puritan life and character, under such captions as "The Pilgrim and the Puritan: Which?"—an answer to the question as to whether the settlers of Plymouth or Massachusetts Bay "had most to do in moulding the people of New England"; "The Early Ministers of New England"; "The Family and Social Life of the Puritans"; and "The Religious Opinions of the Fathers of New England." If little is here presented that is unfamiliar to the student of New England beginnings, all is attractively told, with much geniality of temper and vivacity of style.

A more distinctively local flavor is possessed by three papers which Dr. Byington has included in his volume. Two of these have to do with Springfield, Massachusetts. One is the story of "William Pynchon, Gent.," whose portrait forms the frontispiece of the work under review, and whose experiences, as a theological writer suffering the disapproval of the Massachusetts General Court, Dr. Byington interestingly recounts. The second treats of the difficulties that beset the ordination of Rev. Robert Breck. In his concluding paper Dr. Byington makes an address at the one hundred and fiftieth anniversary of a church at Brunswick, Maine, the vehicle for a brief discussion of "Religious Life in the Eighteenth Century in Northern New England."

"The Good Gray Poet."

Whitman: A Study.

By JOHN BURROUGHS. 16mo, $1 25. Also, uniform with the limited Riverside Edition of Burroughs's writings, with fine portrait of Whitman. 12mo, gilt top, $1.50 *net;* uncut edges, paper label, $1.50 *net.*

Colonel ROBERT G. INGERSOLL, writing to Mr. Burroughs, says:

"You understand Whitman and his work perfectly. . . . You have written a great book, and have built a lasting monument to the memory of your friend. I read every page with delight. All are filled with thought, poetry, and philosophy. You have exhausted the subject, and have said the final word about Whitman and his work."

The New York *Times* says:

"Mr. Burroughs's book treats of the poet, personally and biographically, of his ruling ideas and aims, his self-reliance, his relation to art and literature, to life and morals, to culture, science, and religion, to his country and his times. . . . To Mr. Burroughs, Whitman is a bard, a seer, and a prophet—the first true poet of democracy. . . . His book is interesting and eloquent."

The Nation.

NEW YORK, THURSDAY, JANUARY 21, 1897.

The Week.

THE Senate is right to be deliberate in so momentous a matter as the arbitration treaty, but it ought not to forget its own precedent of December, 1895. Then it was ready to "stand behind the President" and go to war—why, no man knew—on two days' notice. Now war is the thing that really ought to make grave Senators pause. To sit down and count the cost thereof is a part of proverbial wisdom. Terrible consequences are wrapped up in any war, but in a treaty of peace there are no dangers whatever. This is so because you can break the treaty and go to war any day you wish. War can be had on demand, but a chance to make peace doubly sure does not come every day. Hence the duty of rational men to close eagerly with such a chance when offered. The Senate can scarcely afford to put itself in the position of being ready to fight at the drop of the handkerchief, but of demanding weeks to consider whether it is in favor of peace.

Private advices from Washington are to the effect that the opposition in the Senate to the arbitration treaty is founded upon personal opposition to President Cleveland, and in less degree to Secretary Olney, rather than to the treaty itself. This species of opposition does not prevail among the Republicans to any dangerous extent, although it may suit them best to postpone action till McKinley comes in. It is rife among the Bryan Democrats and their silver allies of the mining States. Such opposition is not amenable to arguments addressed to the merits of the treaty. It can be overcome only by public opinion. There is no prejudice against Mr. Cleveland among the plain people, and none worth mentioning against Mr. Olney. So far as the latter is concerned, it may be recalled that the negotiations for this treaty were begun by the late Secretary Gresham, and were pretty well advanced at the time of his death. Now if the plain people want to have the treaty ratified, they must take some pains about it. There is no reason why a man who believes in silver at 16 to 1, or one who believes in unlimited greenbacks and who is in favor of abolishing the national banks, should not be in favor of peace on earth and good will to men. We should like to believe that, on a question of this kind, affecting civilization and involving our repute as professed believers in the Christian religion, all Americans are alike—that Republicans, Democrats, Populists, Prohibitionists, Socialists, and people of every shade of political belief stand on a common platform. We believe that they do so stand. We believe that if this treaty were submitted to a plébiscite, the number of votes cast against it would not be worth counting. Yet it is possible for the Senate to reject it, if those persons who favor it do not take the trouble to let their Senators know how they stand. The movement of last spring, which resulted in the great conference at Washington, where more than forty States were represented by men of high character and influence, ought to be renewed without delay and continued until the question is disposed of. If by any means the treaty should fail of ratification, steps should be taken to begin again. Such an opportunity to take the lead in the world's progress has not presented itself since the abolition of slavery.

What was meant by Senator Hawley's saying, at the dinner of the Ohio Society on Saturday evening, that there is no provision in the arbitration treaty to put a stop to England's policy of territorial extension? If that policy touches territory in which we are concerned, in respect of which we choose to interfere, the treaty does not restrain us in any way. Take, for example, the case of the Hawaiian Islands. If England should seize them, we might consider our interests affected, and the treaty would not prevent us from interfering. What would be the outcome of such a step we need not inquire. Our point is that the pending treaty would not put us in any worse position than we are in now. It would not prevent us from fighting if we wanted to. Senator Hawley recognizes that fact by saying:

> "I am going to vote for the treaty. It is a good thing and a civilized thing to do. And it is only for five years, any way. But I say (and mark my words) that if there be any wrong, any serious insult, put upon our nation and our flag, the American people will fight, be there treaty or be there no treaty."

We can all agree to that. Whether we are Senators or cowboys, we can all "get up on our hind legs" and hurl defiance at the world after dinner, and then vote for the treaty when the time comes.

If there was an enemy of the movement for an arbitration treaty between the United States and Great Britain one year ago, it was the present Premier of the latter country. Lord Salisbury indicated in the plainest manner his objection to the principle in his correspondence with Secretary Olney on the Venezuelan question. It was well understood then that the articles in the London *Times* were in harmony with his views, if not inspired by him, and these articles were distinctly opposed to any scheme of general arbitration, or of agreement to arbitrate in advance of any particular dispute. There is not the least doubt that Lord Salisbury has been coerced by the public opinion of Great Britain to change his policy in this regard. He has been dragged reluctantly to the negotiation. And now, when the Jingoes in this country are in sore need of some means to prevent ratification by us, they invent the tale that the treaty is a deep game of Salisbury's to increase his own power in Europe. If ratification should be refused on this side of the water, Lord Salisbury would be the chief beneficiary of that uncivilized backward step. He may not desire that it should be defeated now, but if it is, he can say to those who pushed and dragged him along: "I knew all the time that it was impracticable. The Americans thought differently. They proposed the treaty, but now they see that it will not work and have abandoned it. I told you so."

The effect of the treaty on other nations is not the least consideration in its favor. Its advocates have from the beginning held out the hope that the adoption of such a treaty between the two English-speaking nations would tend to bring other nations into the paths of peace. The effect which it has already produced on the public opinion of Europe far exceeds these pleasing expectations. The favorable expressions of the press of Germany, France, and Austria have astonished even their own rulers. The gain in behalf of civilized methods of national intercourse has been enormous. It has led to serious talk in favor of reducing the armies and navies of Europe, those awful burdens and fearful menaces to the happiness of mankind. We are not anticipating too much when we express the conviction that the conclusion of this treaty will be followed by similar treaties between ourselves and other first-class Powers, and that every such treaty will carry the principle of arbitration further, until the nation that stands out and refuses to adopt it shall become the object of general opprobrium among civilized peoples.

Senator Sherman's acceptance of the State portfolio made it necessary for him at once publicly to recant on the Cuban question. Only a month ago he deliberately voted for a resolution recognizing the independence of the Cuban republic. Less than a year ago he was the most frantic man in the Senate in insisting that this Government should interfere in the Cuban war. Twenty-five years ago he was for interfering in the previous Cuban rebellion, and, as Hamilton Fish's diary records, when asked by the Secretary of State whether his proposal would not be in violation of our treaty with Spain, he replied that he did not know we had a treaty with Spain. The choice

of such a man, at the present juncture, as head of the State Department, would be most indecent and alarming unless he would consent to announce a thorough change of heart. Mr. Sherman has found no difficulty in altering his sentiments. He is now positively against any kind of interference in Cuba. If the Spanish Government grants reforms, "that is all that is necessary." Why, he sagely asks, should our Government interfere? The significance of this unparalleled conversion lies in the fact that it unmistakably arrays McKinley against the Jingoes. The Secretary that is to be must in this matter speak for the President that is to be. This is only to credit Mr. McKinley with common sense. Foreign complications leading to business disturbance would wreck his administration before it got out of harbor. If he is to have any chance at all, it must come through peace and business stability. It is certain, therefore, that he will do everything in his power to restrain the wrath of the Republican Jingoes. But can he do it? A party that has been for four years raging like a lion for a foreign war, may not find it so easy to reform and lead the sweet submissive life of a lamb, even in the green pastures of power and patronage.

The speech of Senator Mills of Texas on the recognition of the independence of Cuba furnished Senator Hale an opportunity to present a memorandum touching the right of Congress to make such recognition. This is a very strong argument against the existence of such a power. It is the document about which the debate will certainly revolve if the question comes up for debate. The continued torpor of Don Cameron makes this an improbable contingency. Meanwhile attention should be drawn to the first paragraph of Mr. Hale's memorandum, which is of a practical rather than a constitutional type. He calls attention to the fact that the Cameron resolution demands recognition of "the independence of the republic of Cuba," without specifying its boundaries. The boundaries of the island of Cuba are well known and need no definition, but the boundaries of the republic of Cuba are not coextensive with those of the island at present. "This," says the memorandum, "raises some doubt as to whether the intent of the resolution really is to acknowledge a present state of independence as distinguished from a hope of early future independence," etc. No such doubt exists in Wall Street. The only doubt there is as to how much money the shorts made on the decline when Cameron's resolution was agreed to by the committee.

The failure of the House to pass the Pacific Railroads funding bill, or any bill on the subject, leaves the Government in danger of losing its entire claim except the small amount covered by the sinking fund established by the Thurman act of 1878. The first-mortgagees have an undoubted right to foreclose. It has been contended in some quarters that a foreclosure could not cut out the Government's claim, because the Government cannot be made a party to the suit for foreclosure without its own consent. This would be a monstrous doctrine if it could be maintained—no less than a denial of justice between two classes of private citizens simply because the Government happens to have a collateral interest in the litigation. It is true that the Government cannot be brought into court without its own consent, but neither can the Government defeat the ends of justice by merely hanging back and doing nothing. In a much stronger case than this, the case of the United States vs. Lee, which was an ejectment suit brought by the son of Robert E. Lee against the Government for possession of the Arlington estate, the United States Supreme Court held this language:

> "Courts of justice are established not only to decide upon the controverted rights of the citizens as against each other, but also upon rights in controversy between them and the Government, and the docket of this court is crowded with controversies of the latter class. Shall it be said . . . that the courts cannot give a remedy when the citizen has been deprived of his property by force, his estate seized and converted to the use of the Government without lawful authority, without process of law, and without compensation, because the President has ordered it and his officers are in possession? If such be the law of this country, it sanctions a tyranny which has no existence in the monarchies of Europe, nor in any other government which has a just claim to well-regulated liberty and the protection of personal rights." (U. S. vs. Lee, Otto xvi, 196.)

The Arlington estate was restored to Custis Lee, and the Government then bought it from him for $150,000. The case is not identical with that of the Union Pacific first-mortgage bondholders, but the latter is a much stronger one as regards the principle involved—that the Government cannot defeat the rights of private parties by refusing to come into court when those rights are under review by the judicial tribunals. The case is now a very embarrassing one for the reason that it is very doubtful whether it would be an advantage to the Government, in a pecuniary sense, to pay off the first mortgage and take the property, which is merely the main line without branches or terminals.

Senator Wolcott's bill for an international bimetallic conference was introduced by Senator Chandler on Monday. It provides for the appointment of five or more delegates to any conference that may be called by this or any other country, and appropriates $100,000 to cover any expenses that may be incurred. This is all vague enough, and so is the aim of the conference as described. It is to be called "with a view to securing by international agreement a fixed relative value between gold and silver as money, with free mintage at such ratio." No ratio mentioned, no attempt to regulate bullion value, no specification of how many or what nations are to make the agreement, no details of any kind—everything left freely open "with a view." If a conference is called, there will certainly be no lack of views. Experience shows that on no subject can the human mind produce so many and such varied views as on free international bimetallic coinage. Three conferences of the kind have already died from a surfeit of views, but there are plenty left for a new one. Meanwhile Mr. Wolcott is "sounding" English bimetallists at a great rate. He has met Mr. Balfour, and has, we think, made a tactical blunder in going to dine with a Rothschild. It is true that this Rothschild is in favor of doing something for silver and, incidentally, for himself. This, however, will never be believed in the great bimetallic regions of our fair land. The simple yeomanry have been too often told of "the Rothschilds" as the great cornerers of gold, purchasers of railroads for the sole purpose of wrecking them, and gloaters over the calamity of the poor farmer deprived of his wonted silver. If the Rothschilds now come out for silver, it will show conclusively that we do not want it, and must go in for wood, hay, or stubble.

Senator Burrows, fresh from communings with the fountain-head at Canton, sadly gives it as his opinion that there will be no reciprocity arrangement in the next tariff. There cannot be if sugar is taxed. Free sugar was the one thing that led to Mr. Blaine's historic hat-smashing and the reciprocity treaties which came, like a conjurer's cabbages, out of the hat. But this year sugar must be taxed, and it is the reciprocity treaties that will have to undergo the smashing. Congressman Dolliver, it is true, has got up a brilliant little reciprocity scheme of his own. He would have the President generally empowered to put heavy duties on imports coming from countries which did not treat us "right" in the matter of our exports. If Germany thinks our meats are not wholesome, and gets up all sorts of vexatious regulations about inspection, etc., just let a smart sur-tax be clapped upon German imports, and the astonished Dutchmen will fairly clamor to be allowed to eat our pork, trichinæ and all. It was suggested to Mr. Dolliver that this would be in contravention of our treaty with Germany securing her the "most favored nation" treatment. It was enough for him to reply that he did not "think" so. That is the great way of meeting legal or economic or moral objections. If you only resolutely "hold" the contrary, or "maintain" that the objections are not well-founded, or "assert" that some way will be found to surmount

them—why, of course, everything becomes clear sailing at once.

Tariff-making is going to be a very different thing in 1897 from what it was in 1890—so different that it is no wonder the most faithful are a little staggered at the new doctrines now given out as orthodox. Higher duties, of the mysterious kind which are to keep out foreign goods and at the same time increase the revenue, are among the least of the novelties. The Wilson tariff has increased exports to a total never before reached; the new bill is to change all that. Imports under the Wilson bill have fallen off; under a properly protective tariff they will increase again. The balance of trade "in our favor" (to use the pet phrase of protectionists) was never greater. According to McKinley's own logic of 1890, we got more than $300,000,000 of gold out of Europe last year and added it to the wages of our workingmen. We know we did, for there are the figures which cannot lie. But this, too, is all to be changed. Surely times change and tariffs change in them.

The monthly statement of this country's foreign trade, issued Friday by the Bureau of Statistics, completes the very extraordinary record of 1896. For the month of December the excess of exports from the United States over imports was $59,271,093; for the twelve months this excess reached the enormous figure of $325,322,184. The two noteworthy facts embodied in this statement are the increase in December exports over any preceding month last year, and the rise of the year's entire export trade to the largest total in our history. Last year's exports from the United States foot up something over one billion dollars; the exact figures are $1,005,878,417. This is $35,000,000 larger than the total exports during the calendar year 1891, hitherto the highest. Since the export movement has been increasing month by month, there is little doubt that the amount for the fiscal year ending June 30, 1897, will also exceed even the billion-dollar exports for the fiscal year 1892. The meaning of such an export trade is illustrated best by comparison with previous years of trade activity. It will be remembered that our industrial prosperity during the period following 1879 was largely based on the immense expansion of the export trade. Yet the total exports during the fiscal year 1880 were only $835,638,658, and for 1881, $902,377,346.

While this continuous expansion of our export trade during the last twelve months has been in progress, the import trade has been as continuously contracting. It was very generally believed that, after the sound-money vote of last November, engagements of foreign merchandise for import would expand enormously. But the increase has been very slow; in the face of December's rising export trade, imports were $4,000,000 less than in the corresponding month of 1895, and $9,400,000 below the month's record in 1892. The result for the full year 1896, from this simultaneous rise in exports and fall in imports, is an excess of exports reaching the wholly unprecedented sum of $325,322,184. This balance in our favor is $173,000,000 larger than the similar export balance in the calendar year 1891; it exceeds by at least $20,000,000 the largest export balance in our history. It is scarcely a matter for surprise, in the face of such conditions, that Europe is borrowing heavily in our money markets in order to stave off what would otherwise be a rapid fall in foreign exchange and large gold imports to the United States. But such operations can in the nature of things be hardly more than temporary; they add to the already accumulated balance of trade indebtedness by Europe to the United States, and eventually they will press for settlement. Meantime the Treasury's gold reserve, which stood at $44,500,000 last February, and at $100,000,000 with the opening of September, has already passed the high level of $140,000,000.

The *Tribune* heads its article on the Indianapolis sound-money conference "A Bankers' Agitation"—which discloses an animus. It was not a bankers' conference. Bankers had nothing to do with calling it, and took very little part in its proceedings. No banker was elected as a delegate from New York, Boston, Philadelphia, or Baltimore, unless ex-Secretary Fairchild may be considered such; but officers of trust-companies are not bankers in the sense that the *Tribune* here wishes to be understood. No banker made a speech there. Banking influence was completely wanting. The next charge is that the conference had a political aspect. "It was a faint penumbra," says the *Tribune*, "of the worst beaten administration in American history — an administration which found not one-tenth of its party friends to uphold it." It is true that the conference came to the conclusions advanced by Mr. Cleveland and Mr. Carlisle. It is equally true, however, that those who started the Indianapolis movement were and are mostly Republicans of the McKinley type. Mr. H. H. Hanna, the chairman of the executive committee, and the prime mover in the whole affair, is a man of this political complexion. It is safe to say that every man in the conference, or concerned with it in any way, voted for McKinley and desires to support his administration. What is the object, then, of putting the conference in a false light, as though it were some kind of a political dodge, intended in some way to benefit the Cleveland administration. How can anybody have an interest in doing that? Why should several hundred busy men leave their homes in midwinter and travel thousands of miles to serve as a "faint penumbra of the worst beaten administration in American history"? This article of the *Tribune* and one on the same page tendering support to Platt on condition that he will reform and be good, must be taken as signs of mental decay.

Illinois has escaped from the threatened disgrace of absolute conquest by the Republican machine. The audacity of the managers has wrought their overthrow. The State has always maintained an exceptionally high standard for its United States senatorships from the time of Douglas and Trumbull forty years ago. It is not, therefore, as though it had grown accustomed to Quays and Camerons, Hills, Murphys, and Platts. To propose that such a commonwealth should send to Washington as Gen. Palmer's successor an illiterate "boodle Alderman" of Chicago, was consequently so terrible a shock that the outburst of public indignation frightened the managers, and at last caused them to drop the Madden candidacy. It seems strange that the nation should congratulate a State upon escaping a disgrace the very possibility of which ought to be incredible, but in these days of machine power even the success of Madden seemed, until the end of the contest, the most probable outcome.

Inquiries are being made of us whether we think the *Sun* is to get nothing for its support of Platt except a regentship of the university for its managing editor. We know nothing about the matter, except that nobody with our knowledge supports or has ever supported or admired Platt gratuitously. All his followers get something for thinking highly of him, which is only fair. It, of course, seems singular that the *Sun* should go out of its own party in search of its rascals, but there is no real difference between rascals. If you admire Croker or Paddy Divver, you can find no difficulty in admiring Platt, on the same terms. Besides, we do not believe people read the *Sun* for opinion or doctrine. They read it for entertainment. It amuses them to see the old editor throwing mud at somebody or eulogizing scoundrels. It is like listening to low comedy every night in the week. Undoubtedly the effect on the younger men is to develop cynicism and flippancy of tone about politics and everything else, and to make them think champagne and terrapin are the only real forces in modern society; but it does not change their views. We see some of the effects, however, in our machine politics, our feasts with "vaudevilles," and our general *insouciance* about public affairs. The whole country seems a "big dinner," with dancing-girls at the dessert.

THE NEW YORK SENATORSHIP.

THE Platt programme was carried out on Thursday at Albany to the letter in the Republican caucus. Mr. Choate received 7 votes, and Platt 142. Moreover, the Platt nomination was "jammed through," as everything concerning Platt has to be, without speeches. He gave orders that there should be no speeches about him or his qualifications, and the legislators obeyed humbly. When it was all over, Mr. Pavey, conscious of his fault as a supporter of Choate, in order to escape his merited chastisement moved that the nomination be made "unanimous"—an empty and rather silly form, wholly out of place in any proceeding supposed to have principle behind it. To make it "unanimous" means, if it means anything, that everybody in the caucus finally believed Platt to be better fitted to be Senator than Choate, which, as a matter of fact, we presume nobody did.

The transaction is now complete, and it is interesting and instructive as showing how far we have got in our departure from the early anticipations of the founders of the Government. It was their expectation, as set forth in the 'Federalist,' and measurably realized during the first eighty years, that Senators would be elected on account of their character and intelligence, and their prominence in the community as good citizens, so that the choice of the legislators would commend itself to the voters outside. Our Republican Legislature has unanimously rejected such a man in favor of a man probably the most despised in the community, secretly; who has neither character nor intelligence fit for legislative purposes. It has unanimously rejected a distinguished orator for a man who is never known to have made a serious speech. It has rejected a man of spotless life for a man who is popularly believed to be the most of his time engaged in bribery and corruption. It has rejected a man intimately acquainted with the whole system of our Government and laws for a man who has never given any proof of such knowledge, except as much as may be necessary for the purchase of officials.

It has, again, rejected a man whose life has been eminently public—that is, whose mental and moral qualities have been for forty years subjected daily to the estimation of his fellow-citizens—for a man who never appears in public, and is believed to show all his interest in public affairs by the secret and illicit use of money. It has rejected a man who handles no money but that which, in the opinion of all men, he has honestly earned, or of which he does not render a full account, for a man who handles a great deal of money believed to have been unlawfully and dishonestly obtained, who makes a bad use of it, and renders no account whatever. It has rejected a man who believes firmly in the American practice of legislation through open discussion for a man who is opposed to all discussion, who insists, like a thief, on silence in all his transactions, and has introduced into our system a new process of law-making called "jamming through." It has rejected a man who, before any assembly or tribunal in the world, whose language he spoke, would raise the fame of his country for wit and eloquence and reflection, for a man who is unable to appear before any assembly or tribunal without a humiliating display of ignorance and speechlessness. It has rejected a man who is careful in his career to do and say nothing calculated to degrade his own government, to bring its law into contempt, or shake popular confidence in its efficacy and durability, for a man who has passed nearly his whole mature life in practices calculated to bring American institutions into disrepute and falsify the predictions of their founders.

We are living in a time when, for one cause or another, the great Eastern States, rich and populous as they are, have lost their weight in the Senate, through several years of representation by voiceless men of small reputation, and the destinies of the Union have been largely committed to semi-barbarous communities in the extreme West. We have chosen at this time to send to it probably the most insignificant Senator who has ever entered it, for he has not even the wealth to which some of the worst Senators owe their prominence, and for legislative purposes he is more incapable than Hill and more mischievous than Murphy. We have, too, chosen a period when the popular excitement against moneyed corporations has put our government in danger and inspired deep alarm about the future, to send to the Senate a man who owes everything, probably even his livelihood and that of his children, to having for years been the agent through whom corporations purchase legislators to "jam" bills or block them, as they shall direct, who owes all his power and notoriety to the yearly receipt of corporation money, for corrupt purposes. After this performance our bankers, and presidents, and millionaires still expect to convince the enraged masses easily that they are useful to America!

We, therefore, if we are to see a change for the better, think this senatorial election at Albany extremely important, because it may be said to set before the eyes of the country, in the most conspicuous possible way, a confirmation of the views of intelligent and observing men for some years past, concerning the road on which we are travelling. Everything has turned out exactly as they predicted. We have something now more substantial than newspaper denunciation. We see that those who supposed in 1870 that the passage of a charter by the Legislature "owned" by a boss, could never be repeated, were mistaken; that the same situation has come about again, through exactly the same causes, and that as long as these causes are left untouched, declamation about the effects is idle. Politics is not a science, but neither is the conduct of individual life, and yet we can predict national ruin from unchecked corruption as certainly as we can predict individual ruin from reckless extravagance.

THE INDIANAPOLIS CONFERENCE.

THE monetary conference of commercial bodies at Indianapolis finished its immediate business on Wednesday of last week, and adjourned subject to the call of its executive committee. Altogether it may be considered a great success, exceeding the expectations of those who initiated it. So far as the declaration of principles is concerned, there was absolute unanimity, the expression of which was marked by the greatest enthusiasm. The maintenance of the gold standard, and the redemption and retirement of the Government's legal-tender notes, and their replacement by banknotes were the three points of doctrine which brought the delegates together on a common platform. This unanimity teaches the important lesson that the men of affairs in the United States have made up their minds on these subjects, that their conclusions have been the result of experience, and that they are now prepared to battle for the policy which they believe to be necessary to prosperity in business. Inasmuch as the conference was a spontaneous gathering, being as far as possible removed from a "put-up job," and having no conceivable object except the public weal, its action must have a wide and beneficent influence. It is a part of the programme also to push the work so happily begun, by means of a permanent organization embracing the whole country, and not to desist until the currency question is settled on a basis conformable to the experience of the civilized world.

The mode of procedure adopted in this important undertaking was evidently the result of a compromise between two opposing views of policy. One of these contemplated the immediate appointment of a commission by the conference itself to investigate and report a plan of currency reform. The other proposed to ask Congress to pass a bill for the appointment of such a commission by the President. The plan actually adopted provides for both—that is, Congress will be memorialized at the session which is expected to be called in March, to provide for the appointment of such a commission, failing which the executive committee of the conference is to appoint one consisting of eleven members, "to make a thorough investigation of the monetary affairs and needs of this country in all relations and aspects, and to make appropriate suggestions as to any evils found to exist and the remedies therefor; and no limit is placed upon the scope of such inquiry or the manner of

conducting the same, excepting only that the expenses thereof shall not exceed the sums set apart for such purpose by the executive committee."

Congressman Walker, chairman of the House committee on banking and currency, opposed this plan as involving too much delay. He thought that the present Congress ought to take the initial step, because, if it were postponed to the Fifty-fifth Congress, it would be practically carried over to the Fifty-sixth. The answer to this is that nothing prevents the present Congress from acting on the lines suggested, and that Mr. Walker is the very man to set the ball rolling. He is the organ of the committee that has this matter in charge. If he can induce the present Congress to take such action, we shall applaud him to the echo, and we think we might safely guarantee that no objection would be raised by any member of the Indianapolis committee.

Mr. Fowler of New Jersey proposed that a committee of one from each State should be appointed to coöperate with the committees of Congress in the preparation of needful measures. This was rejected since it was believed to be impracticable to constitute a working committee in that way. Although Mr. Fowler's motion was not agreed to, he won the hearty applause of the convention for his speech, which seems to have been of uncommon excellence. He said that national bankruptcy would some day befall us unless the Government should go on and assume the functions of a bank of discount as well as a bank of issue, or should provide a system of taxation with special reference to the gold reserve, or should retire its demand notes altogether and leave the banking business to the banks exclusively. The last, he contended, was the only safe policy. Government notes were not only the most hazardous but the most expensive kind of currency.

This is a proposition which is very likely to be disputed, but what are the facts? Simply these, that the Government suspended payment on its demand-notes for seventeen years in succession, whereas in not more than four of these, if any, could suspension be accounted necessary. On the other hand, the longest bank suspension the country ever experienced was only four years, and even that was precipitated by the Government itself. Mr. Fowler's proposition can be easily maintained. The Government is liable to suspend at any time. It would have suspended two or three times since 1893 but for the lucky discovery of laws on the statute-book which Congress would not now pass. In other words, if the credit of the legal-tender notes had depended upon any Congress that we have had in recent years, it could not have been maintained. We should have been bankrupt before now and wallowing in free silver and irredeemable paper.

OUR RULER THE SPEAKER.

We have not lately heard so much about the Speaker of the House being a Czar as we did in the early weeks of 1890. But there are attributes of czarship more important than counting a quorum; and on the 12th inst. an event occurred at Washington which shows the absolute and autocratic power of the Speaker in the most convincing way.

A strong effort has been making by the advocates of the Nicaragua Canal bill, which involves an appropriation first or last of $70,000,000 to $150,000,000, to get a vote on it this session. The entire congressional delegation from the Pacific Coast waited upon Mr. Reed to ask that the next three days in the House be assigned to the bill. They showed him a petition for such action signed by a large majority of the House—all the Republican members except about twenty, and sixty Democrats. But the Speaker told them it would be impossible to grant their request. Why? Oh, he said that the time had already been assigned to other business. But this, they knew and he knew, was only another way of saying *Sic volo, sic jubeo.* Thus we have the spectacle of a great majority of the representatives of the freest people on earth forbidden by one man even to speak or vote on a bill which they are extremely desirous of passing.

The delegation went away sorrowful, even angry, but hopeless. They had no remedy. What! cannot an overwhelming majority of the House of Representatives do what it wants to? No, it cannot. It is absolutely bitted and saddled by the Speaker. He dictates everything. He says what bills shall pass; he says what bills it shall be permitted even to discuss. All the business of the House is arranged by the committee on rules, but that committee is the Speaker's creation and docile servant. What he tells it to do it does. Even if it did not, he has in reserve a right which dominates the House—the right of "recognition." This means that he determines who is to speak and who is not to speak, who is to call up a bill and who is not. As a matter of fact, every day's proceedings are carefully blocked out beforehand; the men who are to be "recognized" are known in advance (their names are on the Speaker's list), and those who are not to be "recognized" will clamor in vain. Sometimes a man not down on the programme does succeed in breaking in, and then the Speaker asks, "For what purpose does the gentleman rise?" If it is for something that the Speaker does not favor, the gentleman is told that somebody else is "recognized," and that he is to sit down at once. Through the Speaker's power of "recognition," which has over and over again been voted by Congress to be irresponsible and absolute, Mr. Reed can defeat the Nicaragua Canal bill or any other bill. He may prevent any man from getting the floor to call it up.

There is nothing new about this. Mr. Reed is only following and strengthening the precedents set him by his predecessors, and which make the Speaker of the House the most powerful man, as regards legislation, in our public life. The growth and consolidation of his power have been fully traced in Miss Follett's laborious and luminous monograph on 'The Speaker of the House of Representatives.' She records a letter of Mr. Carlisle's to Samuel J. Randall and others in which he formally and expressly asserted the right of the Speaker to say what bills should be considered in the House. There was then a majority of the House ready and anxious to pass a bill repealing certain internal-revenue taxes. They appealed to Speaker Carlisle to "recognize" somebody to call it up. After two days' deliberation Mr. Carlisle wrote them a letter in which he said: "I consider that it would not be proper, under the circumstances, for me to agree to a course of action which would present for the consideration of the House" the bill which a majority of the House wanted both to consider and to pass. This was in 1887.

It is a wise democrat that knows his own rulers. The absolute control of the Speaker over national legislation passes, for the most part, unperceived by press and people. Even the luckless Congressmen who are run over by the Speaker do not clearly see how the system works. They know that some terrible power heads off their bills, but they do not personify it, as they should, in the Speaker. We are bound to say that the Speakers have, as a rule, exercised their autocratic power for the public good. The Blair bill could not be brought to a vote in the House as long as Mr. Carlisle was Speaker. Mr. Reed throttled the free-silver bill of 1890. His killing of the Nicaragua Canal bill is an undoubted benefit. Almost anything, in fact, which the Speaker prevents Congress from doing is a cause for rejoicing. The presumption is that the thing Congress wants to do is a bad thing. If we could only be sure of always having a benevolent tyrant as Speaker, the system would not be a bad one.

As it is, however, its real operation is concealed, and that is a very bad thing. The Speaker has an enormous power, but it is a tacit power. It is power severed from responsibility. He never openly says that he is responsible for the legislation of the House, but he is and should be held so. Speaker Reed's quiet revelation of his power and determination in connection with the Nicaragua Canal bill is his own condemnation of his course in the last session of Congress. He could have prevented the swollen appropriations and the deliberate creation of a deficit. He could have stopped the Venezuelan and Cuban madnesses of last winter. He could have had the House come out squarely for the gold standard and a progressive currency reform. These things he might have done and perhaps made

himself President. That he did not do them was not because he lacked the power. Now that he himself confesses that he has the power, and now that the paralysis of a Presidential candidacy is, for the time being, removed from him, let us hope that he will find courage to match his power, and will organize and control the next House in the interest of economy and sound finance. Possessing the power of a ruler, let him acknowledge the responsibility of a ruler, and rise to it.

ENGLAND AND SOUTH AFRICA.

THIS winter promises to be the most exciting one England has known for many years, owing to the united revolt of the two Irish parties, and the coming home of Cecil Rhodes to be inquired into. The Irish revolt, an Irish Conservative member tells us, brings home rule nearer, in his opinion, than it has ever been before; and the arrival of Cecil Rhodes, and his appearance before the Parliamentary Commission, bid fair to revive all the old hostility between the English and Dutch in Africa which excited so much anxiety last year. In England the feeling about the Jameson raid was very much what it would be here about a filibustering expedition to Cuba. Men condemned it with their intellects and approved of it with their hearts. The Government was strongly opposed to it from the outset, but, had it succeeded, would undoubtedly have condoned it and accepted the consequences—that is, have taken over the Transvaal from Jameson.

When it appeared, however, that his raid had roused Dutch anger all over the continent, and promised, had he succeeded, "a racial war," and still more when the inquiry at Cape Town revealed the fact that there was a good deal of stock-jobbing behind it, and that Cecil Rhodes was cognizant of it, there was a considerable change in public feeling. People got a little provoked with Jameson for coming so near getting the Government into a serious scrape with men who could fight so well as the Boers, and Rhodes went under a cloud, and resigned his office at Cape Colony and prepared to come to England. The telegrams, too, discovered in Jameson's bag, and the telegrams produced at Cape Town in an inquiry instituted by the Legislature there, which enabled old President Krüger to floor Mr. Chamberlain, completed the English disgust with the whole matter. There was no good diplomatic answer to Krüger. Mining stocks were low, and the Matabeles, a formidable native tribe, had risen in rebellion, and were slaughtering and plundering the frontier settlers.

This was Rhodes's opportunity. Beating a hasty retreat from England, he betook himself to suppressing the Matabele insurrection. After some fighting, he went into their camp unarmed, accompanied only by his secretary, and, in an interview with the chiefs, actually talked them into submission. His friends in England, too, had time to raise their heads and write numerous articles in his favor, recounting his services to the Empire, showing the number of square miles he had added to it, and the place he had given South Africa among coming states. He had, in fact, made "Rhodesia," the name given to the new dominion, one of the glories of the Victorian reign. A reaction set in in his favor. The Cape Town population, in so far as it was English, turned to him again, and forgave him his connection with the raid. They feasted him, and presented him with addresses, and he in return took on a tone of defiance to the home Government, and predicted the coming of a great South African republic. The Town Council at Cape Town addressed him congratulations on the "courage and skill he had shown in making peace with the natives," and expressing the hope that he would speedily return to Africa and "devote his great powers to the material development of the vast industrial settlement in the north with which his name was associated." A "reception committee," too, called a public meeting at Cape Town, and passed a resolution admiring "his great and noble work."

But the Boers of the Transvaal took a very different view of him. A party of them, headed by a local notable, Judge Jorrsen, called on President Krüger, at Pretoria, on New Year's Day, to pay their respects, and the Judge said:

> "We do not presume to make to your Honor any suggestions of a political character, but we must declare as loudly and distinctly as possible that we can find no words to express our feelings in regard to the position taken up during the last few days by Cape Colony. The chief criminal in that despicable assault on our country was undoubtedly Cecil Rhodes. A few months ago a Parliamentary Commission found itself forced to give the following verdict: That the part taken by Mr. Cecil Rhodes in the organization of the raid made by Dr. Jameson was not in accord with his duties as Prime Minister of the Colony. This was only six months ago, and that same man is now being fessted during a triumphal progress through the Colony. In the east, in the west, at small towns and in the principal towns, he is glorified as the hero of the day, and even more as the hero of the morrow, regarding whose return to South Africa people expect everything. This is an insult to you, to us, to the whole republic."

Cecil Rhodes thus returns to England with a double load of obloquy, incurred partly by endangering British relations with the Dutch, and partly by having been a little insolent to the imperial Government. The inquiry in London can hardly avoid finding, as the inquiry at the Cape found, that Rhodes was privy to Jameson's raid, and his principal support will have to come from the stockholders in the Rand mines and from the Irish, as he contributed handsomely to home rule in the Parnell days. Had he held his tongue about the South African Republic, the imperialists would probably have rallied to him, but he has distinctly foreshadowed separation. That he is a man of very great ability there is no question, and, if he lives, doubtless he has a considerable future in store for him. He was educated at Oxford, where he graduated from Oriel College, after an unsuccessful attempt to get into Christchurch, where he was rebuffed by the then Master on account of his weakness in Latin. His strength of character was shown in not giving up the attempt, and in overcoming at Oriel the prejudice excited by his rejection at Christchurch. A trial of strength and numbers is clearly approaching between the Dutch and English, and he will probably play a conspicuous part in it.

LEIGHTON AND WATTS.

LONDON, January, 1897.

THE Royal Academy, in economical mood, has made an end to its winter shows of Old Masters. It seems that in the beginning, in 1870, Lord Leighton was one of the chief supporters of these exhibitions, and always afterwards took an active part in their organization and the keenest interest in their success. So the Academy explains in one of its own publications. No sooner is Lord Leighton dead, however, than his fellow-Academicians take the opportunity to be rid of the Old Masters, who, it appears, provoke a disastrous contrast with the new. Besides, the winter show has not proved a paying concern, and, presumably, a Royal Academy of Arts exists for no other purpose than to assure its own financial prosperity. There have been people to consider the exhibition of old masterpieces the "winter garment of repentance," worn by the Academy to atone for its spring indiscretions—the one good thing to come out of Burlington House; and there is no question that the academical decision means a very serious loss to all true lovers of art.

Certainly, the collection of Leighton's pictures, now hung, makes but a poor substitute for the glorious array of Titians and Rembrandts and Velasquezes that so often covered the same walls and gave a little color and splendor to the dull grayness of a London winter. Not that the collection is without its interest. So much has been said about Leighton in the short year since his death, so much ill-considered praise has been lavished upon him, such virtuous indignation has been expressed when his greatness has been as much as questioned, that it is a distinct advantage to have an immediate opportunity for the study of his life's work. Moreover, it so happens that at this very moment an exhibition of Mr. Watts's paintings is being held in the New Gallery, and for years, especially during the seventies and eighties—things have improved a little of late—Watts and Leighton were two of the most prominent of the very small group who rescued the Academy from the slough of commonplace into which the average Academician was fast dragging it. Neither was in sympathy with modern movements, though in Mr. Watts's technique some critics have discovered the origin of *pointillisme;* neither pretended to be in open rebellion, like the gallant young Pre-Raphaelites who started out in life practically at the same time, though Mr. Watts, of course, was their senior by several years. But both struggled against the feeble mediocrity into which English painting had sunk, both struggled to revive the grand manner of the old men and to preserve the dignity of art: Leighton by a return to classicism, Watts by

recourse to a didacticism which, as a rule, critics are readier than painters to think possible. The result was that the greatness of their intention alone was enough to make them tower above their fellow-exhibitors at the Academy.

What Leighton could do when not bound by the rules which he set for himself, you can see in his drawings and his sketches—drawings made in chalk on blue or brown paper that are old-masterly in their excellence and vigor: sketches of places, full of the play of light and air; sketches for his pictures, rich in color, splendid in arrangement as those which Rubens so often dashed in as notes for his huge canvases. The show includes a large number of these studies and drawings, and to see them, without knowing the finished paintings, would be to acknowledge Leighton a master. Some of his earliest portraits, too, reveal the same strength, the same power. There is one of "Miss May Sartoris when a child," a little girl in a dark-blue riding habit, against a bold, beautiful hilly landscape, that a Courbet would not have been ashamed to own; a second of "Miss Ruth Stewart Hodgson," another little girl in a crimson coat, her round full face staring straight at you, her feet planted firmly on the floor where the border of an unseen rug makes an amusing line across the canvas—that Carolus-Duran, at his best, might have claimed. But these are the exceptions. In most of Leighton's pictures you look in vain for the qualities that delight you in the sketches.

Perfection to Leighton seems to have meant an indescribable dulness of technique, an indifference to texture, a smoothness or waxiness of surface that suggests the chromo. A fine sense of composition he had at times: he shows it in pictures like the "Garden of the Hesperides," though close by is the awful "Perseus and Andromeda," as reminder of how completely that sense could desert him. He had distinct feeling for color, as the big "Cymon and Iphigenia," so unsatisfactory in many ways, forces you to admit. But somehow, in his eagerness to give to every niche and corner of his design that perfect finish which he either believed was imperative, or knew the British public demanded of him, he managed to make composition and color completely ineffectual when any one of his larger pictures is looked at from the necessary distance—the only distance from which it can be seen as a whole. Indeed, it is doubtful whether he ever improved upon his "Cimabue's Madonna carried through Florence," the canvas which first made him famous in 1855, when it was exhibited and was at once bought by the Queen. It is in the Academy now, and, as the work of a young man, is unquestionably promising; ambitious in size and design and not altogether lacking in decorative effect. Judged apart from the fact of his age, it would be found crude enough; there is no life, no special observation in the figures of the procession that stretches across the canvas—faces and costumes all smell of the studio; there is no real Italian light or color in the landscape seen above and beyond the high wall that serves as background to the pageant. And yet the picture, as a decoration—and certainly it is as mural decoration that such a work must be considered—tells on the wall far better than the much finer "Daphnephoria" hanging opposite. This was painted twenty-one years later, and is, as it should be, a much more mature and accomplished piece of painting. There is greater elegance in the composition; the procession passes with a more rhythmic pomp and splendor. There is greater grace in the figures; I know of nothing lovelier in any of Leighton's pictures than the group of singing girls, long draperies swaying with their slow-stepping movement, faces delicately uplifted in melodious praise. And below to the right is the white town of Thebes dominated by a great temple set on a hill; and behind the figures a thick grove of trees shuts out all the sunny Greek landscape. It ought to be charming. But so overloaded is it with detail, so conscientiously carried out to the last degree of finish, that across the room nothing is left of it. It would fade into insignificance by the side of one of Puvis de Chavannes's designs, its confusing detail overshadowed by the Frenchman's simple flat masses of color and large, dignified outlines.

I have spoken more at length of the "Cimabue" and the "Daphnephoria" because, of the large pictures, they are the two in which Leighton fails least signally. In others, as in the "Captive Andromache," the composition is more discordant; or, as in the "Hero" or any one of the single figures, the perfect finish degenerates into mere Book of Beauty prettiness. To see Leighton thus alone, unrelieved by the usual Academical feebleness, is to be struck less by the largeness of his aims or intentions than by the indifferent merit of the results. I, at least, have not much doubt that, with years, his reputation as a painter will dwindle, while he will be remembered for his sketches and studies, his book illustrations (to which, unfortunately, no place has been given in the present collection), and his all too few sculptures—the "Sluggard" and the "Athlete" and the little sketch models for his pictures, which are now to be seen in the Academy.

To turn from Lord Leighton to Mr. Watts is to be confronted with very different problems in art. That there may be no mistake, Mr. Watts is careful to explain himself in a prefatory note to his catalogue. The great majority of his pictures, he says, "must be regarded rather as hieroglyphs than anything else, certainly not as more than symbols, which all Art was in the beginning, and which everything is that is not directly connected with physical conditions." His intention is frankly didactic; a thread of thought will be found to connect the whole series of his paintings together, "and to show that the object in work has been to suggest, in the language of art, modern thought in things ethical and spiritual." There is not space here to quarrel with Mr. Watts's theories and principles. The truth is, had he been less an artist his ideas would long since have meant his artistic death. If he is impressive in his work, it is despite, not because of them. And he is impressive; moreover, succeeding just where Leighton is most at fault. His genuinely great compositions, however surcharged with ethical meaning, hold their own. There is a large "Court of Death," not yet completed, and eventually to be presented to the nation, now placed at the far end of the long room at the New Gallery. The minute you cross the threshold, you see it, you feel it, you recognize its power. You may not know what it is all about, but you are conscious of the well-grouped figures, the large, well-balanced masses, the sweep of the lines, the simple grandeur of the scheme; you imagine it as it would look in the shadowy chapel of some dim cathedral or over the high altar of some gorgeous sanctuary. Admirers of Mr. Watts will tell you that it impresses because of his modern conception of Death as the kindly deliverer, the comforter, in contradistinction to the old grinning skeleton of the mediæval painter. But you are no more impressed after the hieroglyph is deciphered, after the riddle is read, than you were before, when you were aware only that you were looking at a fine composition, vigorously brushed in upon the canvas.

It is the same with almost every picture shown by Mr. Watts. The meaning or moral is the last thing you think of, whether it is in the majestic "Love and Death," with the strange, imposing white-draped figure towering above the boy, beautiful in his nakedness; or any one of the three splendid panels, "Eve Tempted," "She Shall Be Called Woman," "Eve Repentant," which are so sumptuous in color that you forget the clumsiness of certain details (the hands, for instance), and would like to see them decorating a palatial hall, as the work of Tintoret and Veronese decorates the Palace at Venice. I repeat, the more obvious is Mr. Watts's ethical intention the less beautiful is his picture. His Uldra and Nixies, his "Paolo and Francesca," his "Dweller in the Innermost"—these, and all kindred canvases, so highly extolled in our days of sham mysticism and Celtic revivals, one would gladly forget for the simpler (simpler in theme, that is) "Ariadne in Naxos," with its perfect landscape and graceful figures, or the "Fata Morgana," with its wealth of color, or the best of the portraits.

It is the fashion to say that Mr. Watts paints the soul in a portrait. I confess I do not know what this means. But I do know that sometimes he renders the beauty and character of a face as few men can, as in the portraits of himself, of Mr. Swinburne, Sir Edward Burne-Jones, Mr. Morris, above all Mr. Walter Crane; that sometimes he presents a full-length figure with a distinction and charm that few of the old men excelled, as in the wonderful "Mrs. Percy Wyndham." But quite as frequently he has produced portraits so insignificant, so absolutely devoid of character and vitality, that, from another painter, they might pass as the veriest pot-boilers. However, if there is one fact the show of his collected work proves incontestably, it is his inequality, his unevenness—an attribute, some say, of genius. The quality of his painting varies with almost every canvas; the man who creates almost the masterpiece one day, condescending to mere rubbish the next. But for this very reason, perhaps, he interests where Leighton merely bores. One would rather have some sign of individuality, even if clumsily expressed, than characterless uniformity, however scholarly.

N. N.

THE CIVILIZATIONS OF NORTH AFRICA: PHOENICIAN, ROMAN, ARAB.

CARTHAGE, November 26, 1896.

SCHOLARS and travellers who have, during the last few centuries, studied the history of the countries round the Mediterranean or described their condition, have been struck by nothing so much as by the contrast between the northern and the southern shores of the great inland sea. For the last eight hundred years, and most conspicuously for the last four hundred, the countries on the north have been the seats of a brilliant and progressive civilization, which in the fifteenth and sixteenth centuries was amazingly productive in literature and art, and which in more recent times has continued to advance in all that makes for

material prosperity as well as for political enlightenment, peace, and order. Meanwhile the lands to the south remained plunged in a darkness that seemed during the six hundred years to grow always deeper, and a barbarism as cruel and repulsive in the beginning of the nineteenth as it had been in the fourteenth century. Till the French entered Algeria, some sixty-five years ago, the whole south coast of the Mediterranean was a theatre of bloodshed and brutality unsurpassed in the world. Morocco, Algiers, Tunis, Tripoli, were known only as nests of piracy; and, within two days' sail from Marseilles or Leghorn, the condition of mankind and the arts of life were at as low an ebb as they had been in the darkest part of the Dark Ages. People had come to think of this as a natural thing, and supposed that Africa was by some permanent historic law destined for barbarism as Europe was for civilization.

No such contrast would have occurred to the mind of any ancient observer. He would have rather inclined to call North Africa a part of Europe, more advanced than most parts of the northern side of the Mediterranean, and essentially belonging to the circle of Mediterranean civilization. Herodotus, indeed, describes much of Libya as in the hands of savages. But there was a line of civilization along the coast in his days from Egypt, the oldest seat of art and culture, past the Greek settlements of Cyrene, Barca, and Tripolis, to Carthage, the greatest commercial city of the world. After the fall of Carthage, Roman government and Greco-Roman civilization struck deep roots in North Africa, and, during the first four centuries of our era, the African shore belt, the Nile valley, and the less arid or mountainous parts of the interior, formed the most productive and the most prosperous provinces of the civilized world, while literature, and especially oratory and Christian theology, flourished as nowhere else within the western dominions of Rome; certainly more than in Italy herself. Down till the time of St. Augustine—that is, till the earlier part of the fifth century—Africa, safe from the assaults of the northern and eastern enemies of the Empire, had preserved an exceptional peace and prosperity, which the inhabitants of Syria and Macedonia and Gaul must often have envied. Even the strife of rival pretenders to the imperial throne had comparatively seldom stained her plains with blood.

North Africa—and I speak now only of the country between the Great Syrtis and the Straits of Gibraltar, for the fortunes of Egypt have often run in a quite different channel—North Africa has had two civilizations planted in it, and has twice seen civilization destroyed. A Semitic and an Indo-European race have been the planters; an Indo-European and a Semitic race the destroyers. The second of these destructions has been one of the most complete recorded in the annals of mankind. Christianity, as well as letters and arts, was utterly blotted out, and the revival which occurred in the earlier days of the Semitic destroyers presently passed away, leaving the country wretched and forlorn down till the coming of the French in our own time.

The first people to bring civilization among the wild Berber tribes were the men of Sidon and Tyre. From a very remote time, probably as far back as the time which we describe as the Homeric age, they had begun to establish first their trading factories and then their fortified settlements at convenient spots on the African coast. These settlements grew into such cities as Utica, Hippo Zarytus (now Bizerta), Hadrumetum (now Susa), and Carthage. Carthage soon outstripped and reduced to dependence the other Phœnician colonies, and after a while began to conquer the fertile region to her south and west, subduing the Libyan tribes that lived nearest to her. She did not care, however, to acquire any far-reaching dominion in the interior, and used the native population rather as a market in which she could buy slaves and soldiers than as material to be Phœnicized and turned into permanent subjects. Neither Punic arts nor the Punic language seem to have spread widely among the people, who were of a race and type dissimilar from the Phœnician. Carthage remained isolated, a ruling city, whose citizens did not seek to permeate and assimilate the people of the land. The soil was tilled either by native cultivators, or, near Carthage herself, by slaves; so no Punic peasantry grew up. There were towns governed by suffetes like Carthage herself: we are told that, just before her fall, Carthage counted three hundred subject to her. But these people were subjects, not citizens. Even the industries that produced the wares which the Carthaginian traders bore away over the western Mediterranean and the coasts of the ocean, were carried on by slave labor, and not, it would seem, by Punic artisans. Thus Carthage remained a city and never grew into a nation, and the failure to expand and multiply made her influence upon Africa comparatively shallow, as well as limited in its range to the fertile country round the city and to the neighborhood of the maritime towns. It was also the cause of her downfall when the great struggle with Rome came. Rome had, besides her own peasantry and her military colonies, the martial population of middle Italy to fall back upon, and was never really in danger save when that population seemed likely to turn against her. Carthage had no such resource; her free Libyan subjects were neither numerous nor loyal, her soldiers were nearly all mercenaries, and when the invader was in Africa and had overthrown one army, another could not be raised. If the efforts the Carthaginians made in subduing Sicily, Sardinia, and eastern Spain had been spent in making Africa Carthaginian, the Punic wars might have had a different issue.

What civilization the Phœnicians did give to Africa was a material civilization, only slightly artistic or literary, and not in the least political. Though the constitution of Carthage itself was both strong and elastic, and received the praise of Aristotle, no sort of political organization seems to have been extended to any part of the Carthaginian dominions, whether insular or continental. Punic art (so far as one can judge from the objects preserved in the museum at Carthage) was rude and monotonous, inferior to that of Etruria, and at best a coarse imitation of Greek models. Books were written, but apparently only on practical subjects, and none of them is known to us except by meagre extracts, preserved in Roman works, from Mago's famous treatise on agriculture. The contrast between the Phœnicians and the other small but even more remarkable Semitic race to which they were so nearly allied, is in this respect remarkable. Israel showed, in Old Testament times, no aptitude for trade, but a striking aptitude for poetry and for the expression of moral emotion. Phœnicia, so far as we know, wanted both these gifts, but had developed a commercial capacity exceeding that of any other ancient race. The Hebrews were a pastoral or agricultural people; the Phœnicians, traders and manufacturers. The fondness for art which we find in the Babylonian and Assyrian Semites was equally absent from Phœnicians and Israelites. The feature common to both these two latter peoples was a certain intensity of national life and passionate energy of temper—an energy in which they surpassed the Greeks, and which enabled them so long to struggle against Rome, whose real resources were far greater, and whose strength of national character, equal to that of the Carthaginians, suffered far less from intestine discords. To be capable of producing really great men is not a bad test of the fibre and quality of a race. The race that produced Hamilcar, Barca, and Hannibal, not to speak of some other brilliant admirals and generals, would even by this have proved itself to stand high among the races of the world.

When Carthage was destroyed in B. C. 146, Rome took over her dominions, gave them a regular governmental administration, and built up a Greco Roman civilization in which probably, before long, no distinctive Punic element remained, except the worship of certain special deities and the use of the Punic alphabet and language. The alphabet has survived to become that of the Berber tribes, and continues in the Sahara down to modern times. The language remained as the common speech of the coast until the end of the fourth century A. D. Roman government and civilization were ultimately extended all over North Africa, which became (as has been observed) one of the most populous, wealthy, and cultivated parts of the Roman world. Carthage, restored to greatness in the time of Augustus, was now the second city of the empire, with a population which is said to have approached a million; and Africa was the granary of Rome. The ruins of countless towns, scattered all over the plains south and west of Tunis, and of the numerous villas with their beautiful mosaic pavements, the most beautiful, it would seem, yet discovered anywhere, give a lively impression of the populousness of the country and the easy life of the upper classes. But the Emperors did not trouble themselves to completely subdue and Romanize the wild tribes of the mountainous or arid interior, just as they left almost untouched the mountaineers of rugged Albania and the tribes of the Isaurian and Cilician highlands. Had these tribes been made Roman in feeling, they might have been a valuable bulwark. But they remained outside, and when the central power decayed in the fourth century after our era, the hill-tribes and the nomads of the desert became troublesome, just as the Picts and Scots did at the same time to the provincials of Roman Britain. They had retained their martial habits and a practical independence under their chiefs, probably to a large extent their heathenism, while the provincials had lost the habit of using arms, and did not know how to organize themselves for defence when the Emperor, pressed by his Teutonic and Persian enemies, was unable to send them help. Thus when the Vandals, who had begun their wanderings from the shores of the Baltic, crossed the Straits of Gibraltar, they found wealthy but unwarlike Africa an easy prey.

Then came the first of the two devastations which Africa was to suffer. The Roman, though he utterly demolished Carthage, had left the rest of the country unharmed, and, under his sway, civilization had spread far more widely over it. The Teuton, however, being a barbarian, exceptionally rude and

fierce among the Teutonic barbarians, destroyed and did not rebuild. He was a Christian; but he was also an Arian, and, unlike the Arian Goths, he hated the Orthodox Africans fully as much as they hated him. There was therefore much pillaging and ruining of churches as well as of the dwellings of wealthy provincials; and there was no fusion of the Vandals with the provincials during the hundred years which followed the Teutonic conquest. Recent archæological explorations confirm the impression made by the scanty records of the Vandal conquest, that with it the destruction of Africa began. Cities disappear from history and are heard of no more; public works are neglected; the fabric of society shows signs of dissolution. Meanwhile the Vandals had from their capital, Carthage, reëstablished by their naval power a West Mediterranean Empire like that of old Punic Carthage, for it included Sardinia and Corsica and the Balearic Isles. But this extension of dominion was useless to a race who seem to have lacked the gift of political creation. The Vandals remained conquerors or pirates; they did not trade and they could not organize.

The end, however, had not yet come. Civilization made another effort. Justinian, who conceived that the country still belonged to the Roman Empire, sent Belisarius with an army to recover North Africa. His victory was swift and easy. The Vandals had no support from their provincial subjects, who welcomed the imperial troops as deliverers; and the feeble resistance made by a race who had been so formidable sixty years earlier, seems to show that either their numbers or their fighting qualities had declined under the sun of Africa. They vanish, their remnants mingling with the provincials, and are heard of no more. They were the only Teutonic race that ever entered Africa; and eleven hundred years were to pass before another came to the opposite end of the continent. The Dutch occupied the Cape of Good Hope in the middle of the seventeenth century, and the English came in the beginning of the nineteenth.

The African provinces do not seem to have gained much beyond the cessation of Arian persecution by being linked anew to the Roman Empire. They were a long way from Constantinople, now the capital of the empire, and had lost the sense of community with the Greek-speaking provinces. They were sorely troubled by the irruptions of the wild Moors of the mountains and the nomads of the desert, and not only was the old organization decaying, but the area of order and prosperity seems to have been more and more narrowed to the level lands along the coast. The use of Latin itself was dying out, and the Berber tongues were those most spoken by the people. Then came the Arab invasion of the seventh century. Left to themselves, for the Empire was too hard pressed in Asia to help them, they made but a feeble resistance. The first great battle, fought not far from the present site of Kerwan, in A.D. 647, overthrew the Roman Governor (then himself in revolt against the Emperor). A second irruption in A.D. 665 permanently established the Saracenic sway; and in A.D. 697 Carthage herself was stormed and destroyed. We know little of what followed. Christianity quickly disappeared, and has never again raised its head among the native population. But there seems to have been a certain revival both of agriculture and of industry, for in the tenth century the sugar cane was grown at Kerwan and cotton at Sfax, and the manufactures of these and other towns were sold far and wide. The country from Tripoli to Tunis was evidently rich and populous, though there is nothing except the mosques of Kerwan to show that civilization had here produced any development of learning or thought or art comparable to that which existed in Bagdad or in Cordova under the Eastern or the Western Khalifs. Such as it was, this prosperity was destroyed by a new immigration of wild desert Arabs in the eleventh century. What with their devastations and what with the intestine wars of rival princes, the country began to sink, and never again recovered itself. For twelve years (A.D. 1146-1158) the coast towns from Tripoli to the Gulf of Tunis were reclaimed for Europe by the fleets of King Roger of Sicily. But the Norman, who might have done so much for these hapless regions, was forced to relax his grip, and Africa relapsed into a barbarism which has made these fertile lands desolate and dreary, and left in them only a sixth or seventh part of the population they might support. The Semite has been the last enemy as he was the first planter of civilization here. The Tunisian Arab, whose huts one sees round Kerwan to-day, is as much a savage as the nomad Libyan whom the Phœnician settlers found when their ships began to trade along this coast thirty centuries ago.

Will the rule of France and the influx of Italian and Maltese immigrants replant a new civilization? Alexander Dumas said, "Africa begins at the Pyrenees." Shall we at some future time be able to say, as the ancients would have said, "Africa begins at the Sahara"? This is an interesting question. I shall hope to return to it in a concluding letter. C. E.

Correspondence.

THE UNIVERSITY OF CALIFORNIA.

To the Editor of The Nation:

Sir: "A Californian Teacher," writing in your issue of December 31, 1896, besides raising general objections—which seem to me entirely inconclusive—against the system of accredited schools as a device for connecting secondary with collegiate education, makes certain representations concerning the actual operation of the system at the University of California. Those representations are so comprehensively misleading that I beg leave to offer a few comments upon them. In the first place, it is distinctly intimated that the accrediting system was established there within recent years as an expedient for increasing the number of students, and thus outstripping Stanford University. This expedient, it appears, has been successful: "With the institution of the present system of accredited schools, the flood-tide in favor of Berkeley has set in, as far, at least, as quantity is concerned." On the implied comparison in respect of quality, it would be neither seemly nor profitable to express a difference of opinion. For the rest, the actual facts are these:

The accrediting system was begun in 1884, some seven years before Stanford University was established. During the past three years, in which time the number of students has increased most rapidly, these additions, so far from being welcome, have caused a serious straining of the educational and financial resources of the University. In certain departments the teaching-staff has been overworked; the buildings have been so overcrowded as actually to necessitate the erection of tents for the accommodation of classes; and more than once the year has ended with a serious deficit in the treasury. This has been due, of course, to the fact that, in a college which charges no tuition-fee, added numbers mean an increased demand without any increase in the resources for meeting the demand. The Regents of the University at one time debated the question of charging a tuition-fee for the express purpose of reducing the number of students. The project was abandoned, as I understand, because it was believed to conflict with the University's charter.

"A Californian Teacher" further charges that the University has in general sought numbers at the expense of lowering its standards. In point of fact, the admission requirements have been slowly but appreciably raised within recent years. What those requirements are, for candidates who take the entrance-examinations, any one who cares to look into the University Register and the pamphlet of specimen examination papers may find out for himself. The requirements are somewhat less than those of Harvard and Yale; with these exceptions they compare favorably, so far as I know, with the conditions of admission to any other college in the country. Now, admission by certificate is a more difficult, not an easier, matter than admission to the University of California by its entrance-examinations. This is illustrated by the fact that pupils in preparatory schools—pupils, often, of no exceptional ability—frequently enter the University by examination six, or even twelve, months before they could have been admitted by certificate. Both University and schools discourage this practice; but that it is possible shows that the accrediting system is by no means recognized by the pupils themselves as a short and easy road into college. The University throws the greatest safeguards around the system. By visitation, by frequently demanding from each school specimens of its examination-papers and written work, and by comparing the work of students from different schools after they have entered college, it is entirely capable of keeping the schools up to the established standard.

Finally, there is no evidence for the assertion of "A Californian Teacher" that the University hesitates to remove from the accredited list schools that have fallen behind in the quality of their work. About two years ago the University refused to accept the certificates, in a certain subject, of the largest and one of the best equipped high-schools in the State. It is *not* a general complaint of Californian teachers that the accrediting system of the University makes life too easy for them. This fact will perhaps make the singular communication of the writer in the issue for December 31 seem the more singular.

I am, sir, yours very truly,

Arthur O. Lovejoy.

Cambridge, Mass., January 8, 1897.

THE PROPER EDUCATION OF GIRLS.

To the Editor of The Nation:

Sir: There is an incisive editorial paragraph in the January number of the *School Review*, a journal of secondary education published by Chicago University, entitled "Cant concerning Co-education." "Co-education" usually refers to work in college, but the editor here treats the education of girls in schools

for boys. His remarks are, however, applicable to the wider sphere. He begins by saying that "a common form of intellectual dishonesty results from the ever renewed attempt to find logical grounds for supporting, as the ultimately best attainable, something which is historically a mere makeshift of necessity." He shows that history knows no formal education but male education, and that when "it came about that girls were considered as having intellects and capacities well worth training and developing, the boys' schools had the field," and girls were, of necessity, let into them. "We let the girls into the boys' schools because that was the easiest and the cheapest way to dispose of their demand for an equal education with boys." The girls now outnumber the boys in the schools, and yet these remain "boys' schools."

"Let there be an end," he exclaims, "of the hypocritical hypnotism by which we are all made to proclaim that a secondary curriculum must always and ever be sexless. Whether there is or is not sex in intellect, there certainly is sex in life. Women as a class do not do, and do not want to do, the same things as men. . . . There is much talk about differentiating courses of study so as to give boys with different aptitudes and, consequently, different potential careers all an equal chance. Let us give the girls an equal chance, and not longer impose upon them and upon ourselves by specious pleas for equality by which is meant identity."

The appearance of an article like this in a journal published by a co-educational college that has a number of secondary schools affiliated with it, in which girls and boys are instructed together, might strike one as strange; but a little thought will show that it is precisely in such an environment that thoughts like these would naturally be evolved. The writer says that "it is dangerous now for one to suggest that the boys' schools are not exactly the very best places in which to bring up girls," and yet he is brave enough to add that "our high schools and academies are modelled for males, they plan to turn out accomplished males, and the females who gain admission to them are turned out just as male as possible, fitted mainly and often craving after some masculine pursuit."

It may seem strange that one who has been for many years encouraging the instruction of women by the professors of a man's university, should repeat, with any degree of sympathy, such utterances as these. I wish, therefore, to say that my incentives all these years have been a sense of justice and a feeling of patriotism. I have felt that woman ought to have access to the best instruction, and that she should be the judge of what is desirable for her. I knew that ninety per cent. of the teachers of boys and girls in New England are women, and I wished to see the greatest opportunities brought within the grasp of these teachers, for the advantage of the state, because it was clear to me that unless the teachers of the schools had the best instruction, they could not fit the boys under them to do well in college. All the while I have held that experience only could tell us whether the collegiate education given to men is the best that women shall ever find. The words of the *School Journal* show that others are looking at the interesting problem in the same way.

ARTHUR GILMAN.

CAMBRIDGE, January 14, 1897.

HINDU AND INDIAN.

TO THE EDITOR OF THE NATION:

SIR: It is not often that the critic catches Mr. Howells in a slip, particularly in literary matters, but surely here is one.

In his very interesting article on "The White Mr. Longfellow," in the August number of *Harper's Magazine*, after speaking of the meetings of the Dante Club, Mr. Howells says (p. 336):

"At the last of them, Lowell had asked him, with fond regret in his jest, 'Longfellow, why don't you do that Indian poem in forty thousand verses?' The demand but feebly expressed the reluctance in us all, though I suspect the Indian poem existed only by the challenger's invention."

The poem to which Lowell referred is, of course, the 'Rāmāyana' of Vālmiki, and Mr. Howells was undoubtedly thrown off his guard by the use of Indian instead of Hindu.

SAMUEL BALL PLATNER.

ADELBERT COLLEGE, CLEVELAND, Jan. 12, 1897.

Notes.

LORD ACTON will edit for the Cambridge University Press (New York: Macmillan) "The Cambridge Modern History" in twelve volumes of about 700 pages each, covering the period from the end of the Middle Ages to the present day. Mr. Bryce, Mr. Lecky, Mr. Morley, Mr. Frederick Harrison, Mr. Sidney Lee, and Prof. Jebb are some of the editor's colaborers. The same firm announces an 'Encyclopædia of American Horticulture,' under the editorial supervision of Prof. L. H. Bailey of Cornell University. The articles will be signed by the respective specialists. The three large volumes contemplated will bear date 1900.

D. Appleton & Co. announce 'The Early Correspondence of Hans von Bülow,' edited by his widow, and translated by Constance Bache; 'The True Life of Captain Sir Richard F. Burton,' by his niece, Georgiana M. Stisted; 'Memoirs of Marshal Oudinot,' from the hitherto unpublished souvenirs of his wife; 'The Story of Extinct Civilizations in the East,' by Robert Anderson; and 'Our Juvenile Offenders,' by Douglas Morrison.

The Riverside Edition of Mrs. Stowe's Writings (Houghton, Mifflin & Co.) proceeds with a volume of 'Stories for the Young,' another of 'Religious Studies, Poems, etc.,' two containing 'Oldtown Folks and Sam Lawson,' and one each for 'My Wife and I,' 'We and Our Neighbors,' and 'Poganuc People and Pink and White Tyranny.' The introductions do not call for remark except in the case of 'Poganuc People,' where Mrs. Stowe's own key to the historic and autobiographic character of the work is given; and of 'Oldtown Folks,' for a like revelation, as well as for Prof. Stowe's account of his remarkable visions during early childhood. These would indicate that he was an undeveloped "medium," in modern spiritualistic language. One may suspect that children oftener than they can tell are attended by like invisible companions, even if we but call them creatures of the imagination. Their reality to the boy Stowe was perfect. This instalment contains several very interesting portraits of Mrs. Stowe.

Messrs. Longman have issued the twenty-eighth and last volume of their well known "Badminton Library." This volume deals with the 'Poetry of Sport,' and is edited by Mr. Hedley Peek. We find here, as elsewhere in the series, evidences of a praiseworthy endeavor to do full justice to the subject, and also to satisfy the reader that this particular volume is one that no sportsman's library should be without. An essay by the ever-ready Andrew Lang on classical sport is apparently thrown in for the purpose of raising the literary tone of the book, which, in spite of this essay and of sundry quotations from Shakspere, Spenser, and others, is somewhat depressing. Mr. Peek condemns in caustic terms the reader who fails to find in his pages an affirmative answer to his question, "Is sport a fitting subject for the poet?" but we are compelled to admit that, with the few brilliant exceptions which are familiar to every schoolboy, his selections leave us in the ranks of the condemned. Among the best are some modern parodies, and the lines on the rule of the road which first appeared in the *Sporting Magazine* for September, 1793:

> "The rule of the road is a paradox quite,
> For when you are travelling along,
> If you keep to the *left* you'll be sure to be *right*,
> If you keep to the *right* you'll be *wrong*."

Students of the socialistic movements taking place on the continent of Europe may find some matter of interest in two works recently published by the Longmans. One of them, by Mr. Bertrand Russell, consists of six lectures on 'German Social Democracy,' in which the author gives a critical and historical account of the theories and labors of Marx, Lassalle, and other leaders, as well as of the political influence and aims of the Social Democratic party. Mr. Russell appears to be a collectivist, but his tone is moderate and his analysis of Marx's theories is destructive. The second work is a translation from the Italian by Richard Jenery-Shee of Count Edward Soderini's 'Socialism and Catholicism,' which also contains an account of the theories of the German Socialists named above, with an array of such antidotes as are offered and recommended by the Roman Catholic Church.

The same publishers issue a seventh edition of Mr. William Leighton Jordan's 'The Standard of Value,' a collection of newspaper articles, letters, clippings, and quotations of a heterogeneous character, all intended to demonstrate the iniquity of maintaining the gold standard. Mr. Jordan sneers at the timidity of such half-hearted bimetallists as would wait for international agreement, and, after the manner of our American agitators, declares that England is a big enough country to maintain bimetallism "without the consent of foreign nations."

In his pleasant little book on 'Old English Customs' (New York: New Amsterdam Book Co.), Mr. P. H. Ditchfield has satisfied, in no small measure, a very real want. His purpose has been to describe the customs actually still extant in various parts of England; and, though he has not quite succeeded in banishing paragraphs beginning "There used," he has kept pretty closely to the limitation imposed, with the result of impressing us anew with the variety and vitality of local usages. No arrangement of the matter has been attempted beyond a following of the calendar; and the contents are of very varying degrees of interest. But on the whole it is a useful as well as an entertaining collection; the more to be commended since the author is satisfied with narration, and rides no hobby, pre-Aryan or other. With his concluding aspiration that "those who are in a position to preserve any existing custom in their own neighborhood will do their utmost to prevent its decay," we shall all be in general sympathy, though it must be confessed that there are some customs, here set forth, about the

maintenance of which serious qualms of conscience might very well arise. It is the common difficulty when evolution becomes conscious.

We cannot give any similar approbation to another book of the popular antiquarian order, Mr. W. E. A. Axon's 'Bygone Sussex' (London: Andrews & Co.). It is a collection of odds and ends, ranging from lesser mediævalisms to stories from the Newgate calendar (not all *virginibus puerisque*), plentifully interspersed with very minor local poetry, some of it the compiler's own. We refuse to believe that the history of Sussex is so barren that it could not furnish forth a volume a good deal more likely than this is to create "a strong and healthy local sentiment." Of course there is an occasional grain of wheat in the chaff, and such books seem to find readers. We can readily picture them — retired business men, in easy garden chairs upon the lawns of villas around Hastings. But to the serious student such books are enough of themselves to justify the adjective appropriated to the antiquarian, to wit, "pottering."

Another volume of 'Eminent Persons: Biographies reprinted from the *Times*' has been published by Macmillan. It is for the years 1891–92, a safe interval. Even an American would hardly challenge the claim to eminence of more than three or four of this group of thirty three, of which the summits are Sherman, Moltke, Lowell, Parnell, Manning, Freeman, Whittier, George Bancroft, Renan, Tennyson, Owen, and Airy, besides Prince Napoleon, Grévy, Boulanger, Tewfik Pasha, Sir John Macdonald, Lord Granville, Bradlaugh, etc. These are not great character-sketches, but they contain details which entitle them to a place in a reference library.

One more link has been added to the chain of evidence which binds German literature to the English of the eighteenth century: J. Barnstorff, in 'Young's Nachtgedanken und ihr Einfluss auf die deutsche Literatur' (Bamberg: Buchner) has with great industry traced the influence of the author of 'Night Thoughts' in the works of Klopstock, Wieland, J. P. Richter, and several minor poets. In the case of Klopstock he has considerably enlarged the list of parallel passages pointed out long ago by Ebert, Cramer, and Hamel. Prof. Franz Muncker, in a brief preface, has some friendly words of commendation for the young author whose premature death prevented him from giving the finishing touches to his essay and seeing it through the press.

One of the most valuable of recent contributions to Dante literature is Alfred Basser mann's beautifully printed and richly illustrated quarto, 'Dante's Spuren in Italien: Wanderungen und Untersuchungen' (Heidelberg: Winter). The author makes a pilgrimage through Italy, and follows the traces of the poet in all the places which he is supposed to have visited, or which are referred to in his works, or which contain frescoes or other delineations of scenes from the 'Divina Commedia' such as are found in Rome, Florence, Orvieto, Pisa, and Lucca. Especially interesting are the illustrations from Codices, of which several facsimiles are given. Besides an excellent map of Italy showing the author's wanderings, there are sixty-seven plates, some of which are reproductions of Alfred Rethel's admirable xylographs of Death. The work is somewhat in the same line of investigation as Ampère's 'Voyage Dantesque,' published in 1839, but is much more thoroughly done, and also far excels the French volume in typographical and artistic execution.

In celebration of the five hundredth anniversary of Gutenberg's birth, the exact date of which is not known, but which occurred during the last five years of the fourteenth century, Alfred Bröckel, librarian of the City Library of Mainz, has prepared a work entitled 'Gutenberg, sein Leben, sein Werk, sein Ruhm,' and just published in fine style by Emil Roth of Giessen. This volume, which is beautifully bound and profusely illustrated, contains all the information available concerning the life and labors of the inventor of the art of printing, and is sold for the moderate price of $1.25.

The *Musenalmanach* for 1897, edited by Dr. Otto Braun and published by Cotta in Stuttgart, contains contributions from fifty German authors and six illustrations by prominent artists. The literary contents are poetical with the exception of three novels: "Unsere Carlotta," by Isolde Kurz, "Der schwarze Engel," by Ernst Eckstein, "Das hässliche Nixlein," by Hans Hoffmann, of which the first is by far the most original in conception and artistic in execution. The first number of the *Musenalmanach*, edited by Schiller and published by Cotta, appeared just one hundred years ago, so that the present issue may be regarded in a certain sense as the centennial celebration of the founding of the famous annual.

'Die Universitäten in den Vereinigten-Staaten Amerikas: Ein Beitrag zur Culturgeschichte,' by Athanasius Zimmermann, S.J. (Freiburg im Breisgau: Herder), begins with an historical sketch of education in the English colonies of North America from 1621 to 1775, and of the growth of higher schools during the period of the Revolution and the conflicts with the mother country from 1775 to 1812. Then comes a chapter on "The Period of Experimentation" from 1820 to the present time, followed by brief biographies of Horace Mann, Henry Barnard, Francis Wayland, Dr. Barnard Sears, and other prominent educators, and a deserved tribute to Dr. Henry T. Tappan in connection with the University of Michigan. There are also chapters on "Catholic Institutions of Learning," "The Great American Universities of the Present," and "The University Education of Women," to which the author as a Jesuit is naturally opposed, believing that the injuries to social and domestic life outweigh all the advantages of superior intellectual culture. We have a list of authorities, a short section on scholarships and fellowships, and tables of the universities, colleges, and preparatory schools in different States, with the number of professors, students, and books in the libraries, and their financial resources.

In a pamphlet of forty-four pages, entitled 'Das Bibliothekwesen in den Vereinigten-Staaten' (Hamburg: Seppel), H. Bonfort gives a concise and, on the whole, very correct account of the growth and character of public libraries in the United States. American libraries, he says, unlike the universities of the New World, owe little or nothing to similar institutions in Europe, but have developed on new lines, unhampered by time-honored traditions and bureaucratic red-tapeism, and thus, through their admirable organization and management, excel all others in accomplishing the purposes for which they are founded. He praises especially the libraries of Massachusetts, and the efficiency of women as librarians, which seems to have been a revelation to him. Among the gifts to the library of Cornell University, the magnificent historical collection of ex-President White and the valuable donations of Prof. Willard Fiske should have been mentioned.

The ninth volume of Jules Lemaître's 'Impressions de Théâtre' (Paris: Lecène, Oudin & Cie.) is interesting in that it shows the distinct tendency of the writer to greater conservatism, and to a repetition, at times, of the ideas so frequently enunciated by Francisque Sarcey in his delightful *chroniques*. M. Lemaître treats the younger school of dramatists fairly, analyzes their works conscientiously, endeavors to pick out the beauties which they contain, even if latent; but he does not enjoy the new school, and cannot see its value. He goes further than this: he does not deny directly the power of Ibsen, for instance, but he cannot see that Ibsen has done anything not already done, and usually better done, by Dumas *fils* or Augier. It is this intensity of national feeling which comes out repeatedly in the present series of "Impressions," as well as the almost regretful criticism of the wholly contemporary weak school of writers who mistake the disgusting and the excessive for genius, or at least talent of a high order.

In the first editions of his 'Vie de Saint François d'Assise,' M. Paul Sabatier omitted all that referred to the famous Indulgence of Portiuncula. Having since convinced himself of the authenticity of the documents in support of this indulgence, he has added to his book a chapter in which he treats the question at length. The scene of the audience is dramatically told. This new chapter will be included in future editions, but is also published separately by Fischbacher.

The eighth part of Mr. Quaritch's 'Contributions towards a Dictionary of English Book-Collectors' is distinguished by a facsimile of Mr. Gladstone's recent letter to this famous bookseller on the subject of collecting; by another of Mr. James Lenox's last letter to Mr. Quaritch; and by a copy of Edward FitzGerald's bookplate, designed by Thackeray in his usual inartistic manner. The accompanying letterpress on FitzGerald goes into minute details of his literary purchases, not without interest to the poet's admirers, and, we suppose, hitherto known only to the first publisher of his Omar Khayyám.

The cheerful fifteenth annual report of the managing committee of the School of Classical Studies at Athens, 1895 96, is accompanied by several instructive photographs of the excavations at Corinth which bore such rich fruit in determining the sites of ancient structures. Attention is called anew to the plaster casts of objects found by the School and to photographs, for sale by Dr. Clarence H. Young, Columbia College; as well as to lantern slides for the stereopticon—of topography and antiquities—procurable by loan or purchase, at a moderate price, of Prof. B. Perrin, 133 Farnam Hall, Yale College.

Under the title of "The Smoky Pilgrims," Prof. Blackmar of the University of Kansas contributes to the *American Journal of Sociology* (Chicago) a brief study of two related families of shiftless and vicious paupers kept alive for twenty years in the Kansas town where they were stranded on their nomadic migration. Portraits from life reinforce the characterization of each member. Loose sexual habits have introduced a colored strain into the family line, in conformity with the recorded observation that mixed marriages at the North are usually between white women and colored men.

In the January number of his *Land of Sunshine* (Los Angeles, Cal.), Mr. Lummis begins the reproduction of rare documents relat-

ing to the Spanish-American portion of the Union with the 'Reglamento para el Gobierno de la Provincia de Californias' (Mexico, 1784). He gives a facsimile of the title page at scale (as we judge), then condensed facsimiles, page by page, of the entire work in a first instalment, too small to be readable for itself without a *loupe*, but serving perfectly to check the accompanying translation in fair type. This innovation upon the current picturesque matter of the monthly cannot fail to commend it to public libraries.

The new quarto form of the semi-monthly *Chap-Book* (Chicago: Herbert S. Stone & Co.) makes a brave showing typographically, barring an affectation in paragraphing the Notes. The margins are generous indeed; the title-page is rubricated. Mr. Henry James begins a serial story, "What Maisie Knew."

The Siberian Railway is making rapid progress, according to an account by Mr. J. Y. Simpson in the January number of *Blackwood*. Sixty-two thousand workmen are employed—on the western section, Russians, Siberians, and Italians; on the eastern, convicts, Chinese, and Coreans. The best are the convicts, whose faithfulness is rewarded by the lessening of their terms of exile—a third, for instance, in one class. Technical schools for the education of engineers have been opened in three of the large towns on the line. Emigration has been encouraged by grants of land and low fares on the railways, with the result that a tide has set in from Russia far beyond the capacity of the road to handle. In the first five months of 1896 there passed through Tcheliabinsk alone 170,000 persons. Towns are springing up in great numbers along the western section, which runs through a "black-earth" country. In anticipation of a great grain crop (Siberia raises now 432,000,000 pounds of grain for export), the Government is constructing a railway to connect the Ob with the Dvina, so that the expensive transit through Russia to the Baltic or Black Sea may be avoided. A large sum has also been appropriated to improve the navigability of these rivers.

A recent number of the *Geographische Abhandlungen*, edited by Prof. Penck of the University of Vienna, is occupied with a minute account of the lakes of the Salzkammergut, by Dr. J. Müllner ("Die Seen des Salzkammergutes und die österreichische Traun"), together with an atlas of detailed maps and profiles, prepared with governmental aid. Lakes of three kinds are recognized: main valley lakes, lying in the course of large streams as they issue from the Alps upon the piedmont foreland, and occupying part of a moraine-walled glacial amphitheatre; upper-valley lakes, lying near the head of a valley beneath steep mountain slopes, and enclosed by morainic walls; and mountain lakes, lying upon the highlands. All are intimately connected with glacial action. Associated with some of the lakes are morainic divides in former valleys, whereby streams are now turned to flow inwards towards the Alpine axis, instead of continuing on a more normal outward course. Both text and atlas supply a profusion of minute details on lacustrine morphology.

The Catalogue of Geological Bibliographies undertaken by vote of the International Geological Congress at its fifth session in Washton, 1891, is lately published (Paris: Gauthier-Villars), under the competent editorial direction of Emm. de Margerie, who has devoted several years of faithful labor to bringing into accurate and uniform arrangement the great body of material supplied by his colaborers. It forms a volume of over 700 pages, and must prove an indispensable work of reference to all studious investigators in its science. An analytical table of contents leads with comparative rapidity to any desired part of the work, and a reference to the indicated pages brings quickly before the eye all that has been done in the way of special bibliography on the selected subject. Geologists everywhere should express to M. de Margerie their indebtedness for his patient and necessarily tedious labor.

The International Association for Comparative Jurisprudence and Political Economy, which was founded a year or so ago in Berlin, and already includes a long array of jurists, economists, and administrative officials, announces a competition which may, perhaps, prove attractive to some American scholar. It offers a prize of 1,600 marks for the best essay giving "a comparative survey of the principles which prevail in the colonies of the most important countries as to the acquisition and colonization of land by settlers, and of the economic results of such principles." Essays may be in German, French, or English, and must reach the Secretary, Kammergerichtsrat Dr. Kronecker, 241 Kurfürstendamm, Berlin, W., before April 1, 1898. They will be adjudicated upon by a board of judges, including, besides three high German function aries, representatives of other countries, among whom we notice Mr. James Bryce for England, Prof. von Martens for Russia, Prof. Philippovich von Philippsberg for Austria, and Prof. Ashley of Harvard for the United States.

Perhaps with reference to the communication from Detroit in our last issue, concerning "School and Home," a correspondent sends us the constitution and by-laws of "The League of Parents and Teachers for the Improvement of the Secondary Education of Girls in New York City," founded on November 13, 1896, by the Committee of Sixty of Barnard College. The League holds regular meetings on the first Wednesday of every month, "at which either topics of general interest are discussed, or lectures given by some person of authority in matters relating to education." The corresponding secretary is Mary E. Rayson, 176 West 75th Street.

—Bacourt, France's minister plenipotentiary to this country in 1840-42, and who had been Talleyrand's First Secretary of Legation in London in 1830-34, naturally measured Americans by the English standard. Hence, while conceding perfect politeness to Martin Van Buren, he saw in that President only "la parfaite imitation d'un gentleman." In 1873, Mr. Lowell, in Bacourt's own country (where Taine could say "the gentleman is not found") wrote of the Duke d'Aumale: "He is a *distingué* person in a high sense, with a real genius for looking like a gentleman." This humor is embalmed by Dr. Murray under the word *distingué* in the new instalment of the Oxford Dictionary (Macmillan). Byron, apparently, in 1813 started the vogue of this exotic in English. But Lowell is sole sponsor for three other words in *dis-*, viz., *dissaturate*, in 1866, *dissensualize*, in 1854, and *disprivacied*, in 1848, in the "Fable for Critics." The last is curious, for Dr. Murray will not overlook in "The Cathedral" (1870) the same poet's

> "By throngs of strangers *undisprivacied*,"

showing how the intervening twenty-two years, which completely made over Lowell the man, could not obliterate this particular word-fancy. There is another negative word in prospect which will upset the provisional claim for *disproportionableness* that it is the longest word in the language—twenty-one letters, nearly an alphabet. But here already is *distinguishableness*, with nineteen, only awaiting its *in-* to rival the former sesquipedalian. Dr. Murray quietly dismisses a different pretension by citing Ouida ("[American speaking] I *disremembered* to ask") with other English authorities only, from 1836 down, for a word which he brands "chiefly dialectic." A real Americanism, the vulgar pronunciation of "*deestrict*" for district, is not recorded here in any manner. American, too, by survival, is the "distance" on our race-course, the English turf knowing it no longer, as we are here informed, though we have an English quotation as late as 1870, "A *distanced* horse cannot start again." No doubt the incarnation of the noun in the verb to *distance*, 'to outstrip,' will long endure.

—Several obsolete words in this section (extending to *distrustful*) will bear remark. We might wish that Howell's *disterr*, 'to exile,' had held its own, together with *disparish*, 'to disappear,' and *disparition*, matching *apparition*. As for *disorient* (1655) and *disoccident* (Marvell, 1672-3), they might any day be evoked beside the living 'to *orient*.' Together they furnish one of numerous examples in our language in which the same meaning is conveyed by contrary words; each having the sense of 'to confuse as to the points of the compass,' 'to embarrass,' etc. Why *dispalate* should have failed to flourish beside its hardly elder synonym *disrelish* is apparent only if we consider that the noun *relish* has a positive as well as a neutral sense, *e. g.*, "a breakfast relish," "to eat with a relish." On this principle *disoffice* gave way before *disservice*, and *disopinion* likewise before *disesteem*. The Elizabethan *disposed*, 'in a jocund mood,' has been reduced to the rank of neutral, requiring a qualifying adverb. We need hardly regret *dispeple*, 'to publish,' which dates from 1297, and derives from Old French *despeupler*. But suppose it had survived to bother us along with *dispeople* (1490), our phonetic reformatory friends would have grudged us the reading aid of the silent *o* in the latter word to distinguish one from other. Dr. Murray marks obsolete Chaucer's *distrait* [destrat], 'distracted in mind,' and notes that the word is usually treated as an alien—*i. e.*, printed in italics—when signifying 'absent-minded.' This is well exhibited in Thackeray's adopting the feminine form, "She was very *distraite*," while Kingsley, no doubt foreshadowing ultimate naturalization, writes, "She was *distrait*." We quote, for another locution, Dr. Murray's first citation under this word: "One of those Sort of Men who are very often absent in Conversation, and what the French call," etc. (Budgell, 1711). Dr. Johnson is held up to animadversion for having altered *dispatch* to *despatch*, which we are accordingly advised to eschew, albeit perhaps the word came to us *via* Spain, after "*des*pachar." But we must forbear. It is pleasant to find Burke's will (1797) cited for "*disposing* mind," and to trace "Man purposith & God disposith" to À Kempis's 'De Imitatione' (in translation, 1450). "A distinction without a difference" is at least as old as 1579. The good news comes that the letter D is now wholly in type.

—There can be no doubt, we imagine, that Dr. Myra Reynolds's Chicago University disserta-

tion, of 290 octavo pages, is the most detailed and comprehensive treatment yet made of 'Nature in English Poetry, between Pope and Wordsworth.' Shairp's 'Poetic Interpretation of Nature' is a more original treatment and of greater literary value, Veitch is as thorough in his keen study of 'The Feeling for Nature in Scottish Poetry.' Biese's 'Die Entwicklung des Naturgefühls in Mittelalter und in der Neuzeit' covers a wider range than Dr. Reynolds's work, but is utterly inadequate in its study of Wordsworth and numerous precursors of Wordsworth. The treatments of the period by Gosse, by Dr. Phelps of Yale, by Symonds, and others, are summary. Miss Reynolds alone seems to have had the courage to read and discuss exactly what was said, and when, by something like 150 poets, concerning natural colors and odors; concerning sounds of winds, of waters, of birds; concerning mountains, the ocean, the sky, night, storms, flowers, trees, and animals; concerning topography, country life and town life; concerning God in nature, and the joy, peace, wisdom, and ethical stimulus that are derived by man from nature. The results of the study receive untechnical statement in a final chapter. The author is surprised to find how completely the ideas of the early nineteenth-century poetry were represented in the germ in the eighteenth century. "Before Wordsworth most of his characteristic thoughts on nature had received fairly explicit statement." The work is a good example of the kind of literary investigation which may legitimately be called scientific, as opposed to very much that is not.

—'La Synergie Sociale,' by Henri Mazel (Paris: A. Colin & Cie.), is a book full of excellent intentions not always happily, or, indeed, wisely expressed. The object of the author is laudable in the highest degree, but his manner of fulfilling it is at times almost intemperate. That object is the importance of what he terms "social synergia," a term defined as "the harmony of the active loves of each individual." This love, he next explains, is "concord between citizens first, then between subjects." Another definition, given near the end of the book, is "active devotion." M. Mazel holds that the decadence of France, such as it plainly appears to him, is due precisely to the disappearance of synergia from the nation. It must be confessed that he makes, in the course of his exposition, many strong points, and does reveal many causes of the weaknesses which even the most patriotic of Frenchmen must needs recognize. The work is divided into three parts—the Past, the Present, and the Future. In the first of these M. Mazel paints a picture of the world's history up to modern times, in which he gives proof of remarkable powers of evocation and description. Indeed, this part recalls the superb chapters of Michelet, in his History of France, in which the Middle Ages are made living to the reader. From a literary point of view, this is incomparably the best part of M. Mazel's book. In the second part he describes the French Revolution in language calculated to make the late Paul Albert, who looked upon it as the greatest event in the history of the world, rise from the grave in indignant protest. But M. Mazel, while he does indulge in excess of language to which we are not accustomed outside of Victor Hugo's novels, here again proves his position and makes his point. He believes in inequality, in the élite, and absolutely disbelieves in the masses, the *turba*, which has never produced and never can produce any great work or any great invention. Hence he desires the return to hero worship, for "it is the heroes who cause the world's progress: civilization springs from powerful individualities, and not from aggregations of large numbers of men." It should be added, finally, that M. Mazel writes in a style which lends considerable attraction to his subject.

—A recent number of the *Far East* contains an unsigned article on "The New Japanese Cabinet" which, in style and thought, is wholly that of Shimada Saburo, the ever-strenuous advocate of the responsibility of the ministry, not to the Emperor, but to the Diet—and, in this article, to "the people." The leading paper, a highly important and unusually significant one, treats of the nature of Japanese civilization. For the first time from a native writer, we have a clear and unreserved avowal that the known history of the Japanese begins as late as that of the Germanic nations. His whole thesis is to prove that the Japanese, so far from being an old nation, is one of the youngest. That traditional conception of the Western mind which associates Japan with China in hoary antiquity is a radical error. Before the Christian era the Japanese archipelago was a waste and empty land, with a few scant tribes of savages. Although the invaders from Tartary streamed over the sea at various times later than the Christian era, civilization, writing, and the means of recording time came only in the sixth century, with Buddhism. Then began what may be called history. The author insists that Japan should be classed, not with China, India, Persia, and Egypt, but with Germany, France, and England. The so-called "Oriental characteristics" wrongly attributed to the Japanese are generalized ideas based upon observations of the present social conditions of the old nations of Asia. Shut off from competition with the world, isolated from the struggles and energies of Europe, with only Korea and China for neighbors—nations with whom there was neither sympathy nor competition—"Japan may be compared to a bright young man without brothers or sisters, without comrades in his plays and in his studies, brought up by a kindly grandmother." The author grieves over the absence, from the sphere of influences shaping Japanese history, of the Renaissance, the Reformation, modern philosophy, the French Revolution, the progress of inventions, and the rise of the American republic. He shows the defects of Confucianist culture, which ignored the entire world of ideal living—a grave defect, remedied by Buddhism, which gave that idealistic temper to the Japanese mind best seen in the refinement of taste, in art and manners. With subtlety and a consummate literary art, that has enabled him to escape the censor, the writer criticises (though with hasty step as if to get past the danger-point) the ideals of government in Japan, past and present. He shows how his countrymen have missed the idea of personality which gives tone to Western life, as well as the spirit and method of scientific inquiry. In a masterly way, yet winningly, he points out the limitations under which Japan has labored in her past career. He calls his countrymen to new endeavor, and pleads "for the sympathy and prayers of the best people of all lands," that Japan's task of adjusting old life and institutions to new environment may be perfected. The author, Yokoi Tokiwo, has been twice a student, while in mature life, at New Haven. He is one of the foremost non-sectarian Christians now in Japan.

—The further examination of the Egyptian papyrus containing epinician odes by Pindar's contemporary, Bacchylides of Ceos, reveals an interesting detail in the ode celebrating the victory of Hiero of Syracuse. Here there is a digression dealing with the myth of Meleager, which is dragged in as certain of Pindar's similar digressions appear to be. This fault, then, so far as it is evident in both poets, would seem to attach rather to the conventional form of the established epinician ode than to the poets who adopted it. Another and more important point seems to be clearly made out in regard to the three compositions of Bacchylides described by Prof. Dyer last week as not clearly written in commemoration of victories, but as having an unmistakable connection with the games. They now prove to be examples of a species of lyrical composition known as the dithyramb. These of Bacchylides are apparently intended for performance at athletic festivals, but are not connected with any person or victory. Students of Greek literature will recognize the importance of this discovery, since no example of a dithyrambic ode has till now been known, in spite of the fact that practically all the great lyric poets of Greece wrote in this style, which was also much in favor with minor poets. Indeed, Suidas alludes to an important work by Damagetus of Heraclea which was entirely devoted to the dithyrambic poets. The nearest to a complete dithyrambic ode hitherto known is a beautiful fragment of Pindar consisting of twenty-one lines. If we now are to have three dithyrambs by Bacchylides, they will afford a most interesting subject of consideration to students of the Greek tragedy, since tragedy is known to have developed from the dithyramb—originated, say some, by Arion himself, though others more credibly trace it to a later singer, Lasus of Hermione, who lived at Athens under the Pisistratidæ, and is supposed while there to have taught Pindar his dithyrambic innovations. It looks, then, as if the new discovery was to have a very remarkable importance, since it now bids fair to supply us with an essential link, hitherto missing, in the evolution of the Greek drama.

THE ELEVENTH CORPS AT CHANCELLORSVILLE.

The Battle of Chancellorsville: The Attack of Stonewall Jackson and his army upon the right flank of the Army of the Potomac, at Chancellorsville, Va., on Saturday afternoon, May 2, 1863. By Augustus Choate Hamlin, formerly Lieutenant-Colonel and Medical Inspector, U. S. Army, Historian Eleventh Army Corps. Bangor, Me.: Published by the Author. 8vo, pp. 196, with nine maps in colors.

In this book the Society of the Officers and Soldiers of the Eleventh Army Corps may be said to have officially challenged the aspersions upon their conduct in the battle of Chancellorsville. By resolution passed at their annual meeting in December, 1895, they adopt the work of Dr. Hamlin as their own, both in its vindication of the soldierly conduct of the corps as a whole and in its arraignment of Generals Hooker, Howard, and Devens.

If Dr. Hamlin was not the official historian of the corps, his book would still command attention by the ability with which he has ar-

rayed the evidence which is now made accessible by the publication of the Official Records, together with the material from private sources which time has brought to light. Nothing can appeal more strongly to the sympathies of fair-minded men than the deeply earnest protest of some ten thousand intelligent and patriotic soldiers that they have been, for thirty years and more, maligned and abused; that they have been falsely charged with cowardice, and with causing the defeat of a great national army by a senseless and unnecessary stampede. What they say through their advocate makes, as it ought to make, a serious demand upon future writers of history to weigh with careful scrutiny and just balance the proofs and the arguments which they offer. There is no denying that they have borne for a long time a fearful burden of military opprobrium. The larger number of those who survived that awful day in the spring of 1863 have by this time followed into another world their comrades who fell on the field; but only the greater duty is laid upon the living to vindicate their fellow-soldiers as well as themselves, if they have been wronged.

In various forms they began their cry for justice within a week from the day of battle. Some of their officers asked for official investigation, for leave to publish their own reports, for courts of inquiry, for leave to testify before the Congressional Committee on the Conduct of the War. It was thought impolitic by the War Department to make a public investigation, as being more likely to give aid and comfort to the enemy than to bring any advantage to the national cause. The Eleventh Corps men still sought through the press to get a modification of the popular judgment. They have not been wholly unsuccessful. In his paper on Chancellorsville in the 'Century War-Book' General Couch spoke the sentiment of intelligent military men when he said that any other corps of the Army of the Potomac would have broken before such a flank and rear attack as the Eleventh Corps was subjected to. Still, the bad name had been given, and it stuck. Underwood and Dodge, writing histories of the campaign, did something to remove the wrong judgment, but a full examination from the corps point of view seemed still the only adequate remedy.

Dr. Hamlin examines, first, the composition of the corps. As to nationality, he tells us that instead of its being a German corps, as is currently believed, probably three-fifths of it were Americans by birth, comprising some of the best native material from the East and the West. Of the German regiments and officers of rank, he shows that they were not adventurers, but patriotic naturalized citizens, well educated, well drilled, of good discipline, comprising many men of distinguished attainments in every department of learning and of public and private activity. Some of the officers were soldiers who had made brilliant reputations in the armies of Germany and France. The fourth chapter of the book, on the "Personnel of the Eleventh Corps," is itself a valuable contribution to the history of the civil war.

The author next examines the actual position of the corps on the field, and shows that it constituted the right wing of Hooker's army, being deployed along the turnpike leading from Chancellorsville through the wilderness to Orange C. H. Its line was nearly east and west, facing south, reaching from the Dowdall Tavern a mile and a half westward. Its extreme right flank was bent back so as to oppose one brigade to any attack that might come along the turnpike against that end of the line. Jackson, with more than twenty thousand men arrayed at right angles to the turnpike, came against this exposed flank where only one brigade was in position to oppose him, and no change of front by the corps was attempted until the Confederates were at close quarters with the single flank brigade. That the division to which it belonged (Devens's) was rolled up and driven off in a disorganized mass, was a matter of course. Dr. Hamlin seems very logically to draw his conclusion that here was no question about the courage or cowardice of the rank and file, but one of responsibility of general officers, pure and simple.

Carl Schurz's division was formed to face Jackson in time to do some stout fighting, but was partly broken by the retreating masses on the road at its left, and far outflanked on the right. The artillery did good service, and Jackson did not gain more ground without paying severely for it. Still, Schurz also was forced to retreat, though he fell back with deliberation and in creditable order. Steinwehr's division (minus its strongest brigade, which had been detached) also made good resistance, but it could not gain a good position, and Jackson's impetus, with the decisive advantages of a flank attack and great superiority of numbers, was sufficient to drive the whole corps back close to Chancellorsville. It had taken some two hours to do this, and the aggressive power of the Confederates was exhausted some time before Jackson fell in the early evening.

Concerning two of the three divisions of the corps, therefore, it may be fairly said that they were not disorganized, and yielded ground under the pressure of greatly superior numbers in positions not of their own choosing, and where they fought at such disadvantage that they could not be expected to maintain themselves. As to the other division (Devens's), it was struck in flank, at the end of its thin line of deployment, where resistance was, by every military rule, futile. It was knocked to pieces, of course. The army machine is not made to be used that way; as well expect a ship to sail over rocks and reefs as if going through the water.

Where, then, was the fault? Dr. Hamlin's array of evidence shows that there was no lack of warning. Again and again notice was sent in from the pickets and from reconnoitring officers that a very heavy Confederate force was forming for attack in the Wilderness forest on the right flank and rear. The officers making these reports were as well worthy of credence as any others in the army; yet their earnest and reiterated assertions of the fact were received, apparently, with contemptuous scepticism, not even worth the pains of personal verification by the superior commanding officers. The facts constitute a psychological problem, as well as a military one, of a very curious character. General Hooker received information from his centre corps about noon that Lee's army appeared to be retreating across the front, toward Orange C. H. This seems to have been received as indubitable fact, without inquiring what else such a movement across the front might mean. Sickles moved his corps out "in pursuit," and the centre was thus stripped of the troops which, in a few hours, were sadly needed to support the overwhelmed right flank. The "pursuit" was not swift enough or strenuous enough to interfere with Jackson's movement, and went far enough only to put Sickles's corps out of the combinations for several hours. It thus contributed to Jackson's success as if he had commanded both armies. One would have thought that the news of a force forming for attack beyond the right flank would have given at once the right meaning to Lee's "retreat." It did nothing of the kind. It seems to have been regarded only as proof of the panicky character of Eleventh Corps officers. So the awakening came when Jackson had smashed Devens's division—not before.

Some light is thrown on the matter by looking back at the history of the corps in the campaigns of the previous year. It had been Sigel's corps, part of MacDowell's army, and afterwards part of Pope's. It had hardly served with the Army of the Potomac, and had suffered from the jealousies which were so rife during all that year. Howard was newly assigned to the corps command and Devens to his division. It was scarcely possible that they should be free from the prejudices of what had been McClellan's army. Hooker, by temperament, was likely to feel them in an exaggerated degree. The corps was looked upon as a dubious quantity of questionable quality, that was to be "licked into shape" under new leading and instruction. Reports of danger on the flank, under such circumstances, would be very likely to seem panicky—just what was expected. A longer acquaintance between commanders and subordinates would probably have made such misunderstanding impossible. The reports and correspondence of the subordinates show that they were exasperated to the last degree by the consciousness of being misjudged. No situation could be better prepared to breed trouble.

It is not yet possible, perhaps never will be, to divide the responsibility equitably between Hooker, Howard, and Devens. Dr. Hamlin gives proof of the warnings which went to the division commander, but we cannot tell how far they were transmitted. The scepticism expressed by Devens might be only the reflex of the condition of mind at headquarters of the corps and army. He could not foster insubordination by openly blaming his superiors. More complete means of doing justice may some day come to light. This book may fairly be said to close the first chapter of the debate by showing conclusively that the question is one of generalship, and not of soldierly quality in the rank and file.

Dr. Hamlin very properly "carries the war into Africa." He takes up the analysis of the Union and Confederate records to show that some of those who have been loudest in jeering at the Eleventh Corps are quite vulnerable. That the Eleventh was overwhelmed by vastly superior forces under Jackson, no one now denies; but he boldly avers that the desperate and triumphant contest that evening at Hazel Grove was with an imaginary enemy. Into this we cannot go.

The book treats at large only one feature of the battle, the attack on our right flank on Saturday afternoon, May 2. It is that alone which specially concerns the Eleventh Corps. Yet the character of the whole contest affects the judgment of every part. Hooker was beaten by Lee with but little more than half his numbers. He had abandoned the initiative and accepted a purely defensive rôle before Jackson made his attack. He was already strategically defeated unless he took advantage of Lee's temerity in widely separating the two wings of his inferior army. This Hooker seemed incapable of doing. He hugged the delusion that Lee was retreating till Jack-

son gave him a rude awakening, and then his paralysis of will and intellect became even more complete. With a commander so plainly overweighted by his responsibilities and so easily beaten, the historian does not need to look further to find reasons for unsatisfactory results on any part of the field.

In one respect Dr. Hamlin might, with a little trouble, have made his book much more valuable. By giving in foot-notes the references to the Official Records which he has analyzed, it would have been easy for us to verify his work. It is a serious fault in a narrative that is necessarily controversial, to omit a full and accurate system of references, by volume and page, to the author's authorities. On the other hand, the ample series of maps copied from Col. Michler's official surveys could hardly be improved. The colors guide the eye admirably and make each sketch intelligible at a glance. Being compiled so as to show the actual situation at nearly every half hour, they make, of themselves, a history of the field that is a model for work of the kind.

The military histories of our time are noticeable for their refusal to accept an official narrative as beyond appeal. Moltke was warmly opposed to the debate of any matter supposed to be set at rest by the staff history issued from headquarters. Yet the German and French presses teem with books radically controverting the official story, and it must be added that they very often show good reason for doing so. It is a satisfaction to every lover of historical truth to see this fearlessly and fully done. The controversies over modern events are wholesome because they give us a fulness of evidence which makes our opportunity of reaching truth incomparably better than in any former time. In every sense Dr. Hamlin's is a useful and welcome addition to the material for our military history.

RECENT LITERARY CRITICISM.

English Prose: Selections, with critical Introductions by various writers and general Introduction to each period. Edited by Henry Craik. Vol. V. Nineteenth Century. Macmillan. 1896.

Essays. By Arthur Christopher Benson. Macmillan. 1896.

That Dome in Air. By John Vance Cheney. Dodd, Mead & Co. 1896.

Idyllists of the Countryside: Being six Commentaries concerning some of those who have apostrophized the Joys of the Open Air. By George H. Ellwanger. Dodd, Mead & Co. 1896.

Essays in English Literature 1780–1860. By George Saintsbury. Second series. Scribners. 1896.

A History of Nineteenth-Century Literature 1780–1895. By George Saintsbury. Macmillan. 1896.

THE fifth and last volume of Mr. Henry Craik's 'English Prose' is meant to cover the 19th century. It contains, like its predecessors, an extensive and skilfully made selection of characteristic passages from a large number of good authors (ranging, in this instance, from Scott to Stevenson), with a general introduction and brief prefaces. For the selection, as we have hinted, we have nothing but praise. The introductions, however, are not equally acceptable. Some of them are good, and most of them are at any rate harmless, but, taken together, they do not give one an impression of much critical vigor or much felicity of style on the part of their writers. Perhaps the worst of the lot is the general introduction by Mr. Craik himself, which seems to us both dull and pedantic, in spite of its manifest struggles to be neither. Characteristic is the following sentence, in which the most hackneyed of truisms is produced with a solemnity almost comic: "It is a common fallacy to believe that simplicity is always due to nature; it is quite as often due to the highest art." Another passage, almost equally characteristic, deserves to be quoted for the rich quality of its unintentional humor: "That common form of intellectual perversity which thinks that it has sufficiently marked the place of Johnson in prose style by calling him turgid and sesqui pedalian, inevitably leads its victims into a parody of his formality which lacks the faintest reflection of his virility and force." If the Doctor could read this, he would, we fancy, straightway begin to ruminate the "desperate saying" of the Florentine that, though we are bidden to forgive our enemies, we are nowhere commanded to forgive our friends.

Nothing better than this sentence of Mr. Craik's has appeared of late, if we except the definition of modern simplicity in Mr. A. C. Benson's 'Essays,' propounded with like seriousness:

"Modern simplicity," says Mr. Benson, "must show the spareness of asceticism, not the leanness of anæmia. It must arise from the repression of luxuriance, not poverty of spirit. Strict simplicity implies the rejection of all startling and glittering tricks of style, and consequently it implies a lowly patience in pursuit, with an indefatigable zeal for the selection of the precise, the majestic, the supreme."

Mr. Benson's "Essays," we hasten to add, are not to be judged from this passage. They are gently, but often subtly, appreciative; the subjects—Marvell and Henry More and Vincent Bourne and Gray and William Blake, to mention no others—are interesting; the critic's temper is always amiable; his judgments are usually sober, and never eccentric. In a word, Mr. Benson's book, though not a great book, is a good one, of the kind to make friends and keep them. We hope for a second edition, in which the plaintive preface shall be cancelled; for Mr. Benson should take courage—he is no *vox clamantis*, and he need not call himself names.

Under the title 'That Dome in Air,' Mr. John Vance Cheney has collected a number of his papers on poets and poetry, chiefly American. These little essays, all or most of which were originally intended for popular lectures, are agreeable to read, and show the author's well known delicacy of taste, but they can hardly be regarded as of permanent value. Mr. Cheney entertains some rather mystical views about the relations of poetry and religion, which find expression—none too clearly—in the first paper of the series.

There is no questioning Mr. Ellwanger's love of nature and the nicety of his observation. He is also an appreciative reader, a graceful writer, and not a bad critic of men and books. All these qualities come out in his 'Idyllists of the Country Side,' a pretty little volume, with no mission (thank Fortune!) but to please and refresh. The six papers of which it consists concern Walton, White of Selborne, Hardy, Jefferies, Thoreau, and Mr. Burroughs—very various people, certainly, associated only by virtue of their common trait of love for the country. The best papers are, perhaps, those on Walton and Gilbert White, but all are agreeable, and there is no nonsense about any of them. It is absurd to *discuss* a book like this. The thing to do is to read it, or parts of it, as the fancy takes one, and be cheerful.

Most of Mr. Saintsbury's volume of 'Essays' is good, honest homespun, but there is one very purple or rather crimson patch, the paper on "English War-Songs." At first one fears that the hue of this particular fragment comes from a baptism of blood, but we are inclined to think that the dye is made of less costly materials—perhaps even of one of those innocent, non-coagulating mixtures which flow freely upon the stage without giving the spectator any real cause for alarm. Be that as it may, the paper is no doubt very fierce and truculent, and "calculated" to do much damage in the ranks of those whose canons of criticism are Quaker guns. At the outset Mr. Saintsbury scowls fiercely at "the curious little sectarian heresy which calls itself the Modern Spirit," because he thinks it regards as "a barbarous and exploded crudity" the belief that "the two things best worth doing in this world are fighting and love-making." We are sorry that Mr. Saintsbury should go out of his way to bully "the Modern Spirit," for, whatever its faults, we cannot see that it has ever done him any harm. For ourselves, we had supposed that the curious little modern heresy was, in this particular, really a doctrine of older date, and not unconnected with a venerable and sacred institution for which Mr. Saintsbury has at all times a genuine respect. However, it is only fair to say that this part of Mr. Saintsbury's article shows some signs of being meant for humor—and we have never yet felt quite sure of Mr. Saintsbury when he is working his humorous vein. Still, we believe we are safe in saying that there is no humor in what follows. It is the passage which gives the test of good "war-poetry":

"If, in the case of a certain number of persons of different ages, educations, ranks, and so forth, it induces a desire to walk up and down the room, to shout, to send their fists into somebody else's face, then it is good and there is no more to be said. That it does not cause these sensations in others is no more proof of its badness than it is a proof that a match is bad because it does not light when you rub it on cotton wool."

Such observations prompt the hope that Mr. Saintsbury locked his door, and put his pipes and bric-à-brac in the cupboard, and threw the poker out of the window, before he actually sat down to the composition of an essay which forced him to recall so many pieces of good war-poetry.

The same author's 'History of Nineteenth-Century [English] Literature' has, as was to be expected, a good deal of merit and some grave faults. To cover English literature from 1780 to 1895 in less than 500 pages is not easy, unless one is content with either superficiality or dry bones. Mr. Saintsbury is not content with either. He is very widely read in modern literature, and, though not always quite accurate, can certainly measure knowledge with any of his critics. He also likes to be sprightly, and he usually succeeds in being interesting. In the present case he was, of course, obliged to omit much that he would have liked to insert, and to condense resolutely. That he has done this without spoiling his book is much to his credit; but one cannot help wishing that he had taken more pains with structure and proportion. There is a hurry and bustle about the narrative and the criticism alike which is rather wearying than

exhilarating. We are more than once told that the writer cannot stop for this or that, and we get the impression of being continually requested to move on. The plan of the book, with its alternating short biography and brief criticism, helps to produce a feeling of worry and distraction. To Mr. Saintsbury's prejudices we need only advert: they are here, and their name is legion, but they are so frankly self-confessing that they can do little harm except to the very feeble. It is a pity, however, that they carried him so fast and so far when he was "writing up" Byron that he forgot to mention "The Vision of Judgment."

We had thought to add a word on Mr. Saintsbury's style, but the subject is too hackneyed. Such phraseological gems as "a singular though scanty vein of original lyric snatch," and "but he is a failure of a considerable poet, and some fragments of success chequer him," may be had for the asking.

FIELD-MARSHAL BOYEN

Das Leben des Generalfeldmarschalls Hermann von Boyen. Von Friedrich Meinecke. Vol. I. 1771–1814. Stuttgart: Cotta. 1896.

It is the boast of the German army that no one regiment is better or worse than the other, but that all are educated to a high average of military knowledge; and as in the army, so in official life, the Germans, and particularly the Prussians, point with pride to a long succession of excellent administrators in every department of the Government. Most of these excellent men live and die unknown to the outer world, for they are trained to regard themselves merely as a small part of a huge machine. Occasionally, however, great events call the attention of historical students to particular parts of this state machinery, and then only are we apt to discover the existence of such men as Boyen. The great war minister Von Roon might never have been heard of but for the war of 1870. We might never have heard of Boyen but for the happy circumstance of his having left behind him an autobiography of the most precious kind, recently edited by Prof. Nippold of Jena. The present Life purports not merely to contain all that Nippold gives, but to constitute a history of Boyen and his times. It is an ambitious project, which the author modestly recognizes in his preface by explaining that he was urged to this work by Von Sybel.

The importance of Boyen lies in the fact that he was an honest and patriotic Prussian soldier, who, after the battle of Jena, devoted his whole energy to the reform of the army, and courageously urged his views upon the very weak King, Frederick William III., knowing all the while that he was making himself unpopular with that monarch and running the risk of military disgrace. He was a loyal friend and supporter of Scharnhorst, and when that great man died in 1813, Boyen persevered in the reforms already instituted, and, until his own death in the early part of this century, never flagged in his zeal for a popular army. The King of Prussia, on the contrary, desired to be surrounded by professional soldiers only. He looked with great distrust upon a people in arms, for he feared lest popular dissatisfaction might express itself too forcibly. He regarded military officers as the only citizens capable of understanding the meaning of "honor," and was strongly prejudiced against permitting other than nobles to enter the army. It is doubtful whether he would ever have made war with Napoleon in 1813, had not his people risen in rebellion, not only against the French, but against their king as well.

Boyen was born in 1771 in Prussia. His father was a page at court. The childhood of young Hermann was a happy one so far as worldly surroundings are concerned; in this respect contrasting strongly with the poverty which was the lot of his great colleagues, Gneisenau, Blücher, and Scharnhorst, who all grew up as ragged, barefoot farmer lads. We are told that he had a tutor at the early age of four, that he wrote a novel when he was only nine, and that he entered the army as gentleman corporal at the age of thirteen. These facts are of no great importance, so far as Boyen is concerned, but illustrate the character of the times he lived in. The rulers of Prussia, to this day, become officers in the army when they are ten years of age. It is a relic of the days when fathers nominated their sons to favorite regiments, as they now sometimes place their children's names as candidates in a club, a public school, or similar institutions where time counts in favor of the candidate.

The youngster who entered the Prussian army in those days was subjected to a training designed to make of him a man indifferent to personal comfort. Frederick the Great was on the throne, and the officers' life, in his day, was not one of pleasure. Boyen tells us that he was made to sleep in the same room with two private soldiers, and that he received as military godfather a sergeant who gave him what was then regarded as the training of an officer. There was no book-learning worth mentioning, in that army, and no such thing dreamed of as the present general staff. The soldiers of Frederick looked upon a book-worm as one who could not possibly do good field work, and we must admit that they were partially justified by the results of the Seven Years' War. Mr. Meinecke, on page 19, traces the strength of Frederick the Great's army largely to its moral and religious character, but he does not bring evidence to the support of this statement. He does not dwell upon the fact that about half of Frederick's soldiers were mercenaries, who were kept from deserting by the most rigid discipline only, and that he recruited his men without particular reference to their origin. We are more inclined to the opinion that Frederick the Great accomplished what he did with his mercenaries because men are attracted to a successful general; and in Frederick they found a leader who kept them well fed, well clothed, and well supplied with booty.

At the age of sixteen, when with us a lad enters West Point, Boyen had completed his military apprenticeship, and was admitted to his regiment as an officer (1787). Boyen chafed under the purely routine character of a soldier's life in a small town of East Prussia, and hailed with delight an opportunity which presented itself of seeking professional instruction at the university town of Königsberg. Here, three years before, had been established a rough sort of military school, principally for the instruction of artillery and engineers, who were regarded in those days as mechanics, rather than soldiers, somewhat as on board men-of-war those officers were regarded who had exclusive dealing with the steam-engines. Seven of these military schools had been established in Prussia after the Seven Years' War, but there was no systematic plan of education in the modern sense of that term.

Germany's great philosopher, Kant, was then at the height of his popularity, delivering lectures at the University; his 'Kritik der reinen Vernunft' had appeared in 1781, and in 1788, the year when young Boyen first listened to his teachings, there had issued from the press his 'Kritik der practischen Vernunft.' Kant was the great thinker of Königsberg, and Boyen listened attentively to his lectures, and tried to understand them, but it is doubtful whether he got a great deal of benefit from this study, much as his biographer might wish to have us think so. There was, however, a political economist also at the University, whose name did not become so famous as that of Kant, but who exercised upon young Boyen an influence of the greatest importance. His name was Kraus, and Boyen recalled with pleasure conversations with this man on the subject of national wealth and economics generally. He at least made a complete convert of Boyen; explained to him the machinery of taxation, the relations of export to import; taught him the truths which Adam Smith had first published to the world in his 'Wealth of Nations' (1776); showed him the mischief which was being done all over Europe by systems of so-called protection which impoverished the state and led to useless wars. This was strange teaching for a soldier to enjoy, but, stranger still, it was the only teaching that proved of any real value to Boyen during the dark years of Prussia, when military questions resolved themselves principally into the economic one of how money was to be raised out of a bankrupt community.

The very weakness of Prussia between 1806 and 1815 forced a monarch trained to absolutism to confess at last that he was helpless and in danger of being driven from his throne. Only in this extremity did he permit himself to call upon his people for assistance, and to this we owe the fact that this weakest of monarchs secured the assistance of a galaxy of great men, such as Stein, Hardenberg, Scharnhorst, Gneisenau, and Boyen. To-day a War Minister represents chiefly the spending of money. In his time Boyen, the soldier, had the education of a finance minister, and was able not merely to plan a war budget, but at the same time to justify it on economic grounds.

In 1794 he was far in advance of his time in opposing the partition of Poland, a step not only dishonest at the hands of Prussia, but which has done her great injury down to our time. Boyen urged that Poland be held intact as an independent Power, foreseeing that the trade relations between that country and his own might be of great value, whereas if Russia absorbed a large part, it would be an economic loss to Europe. During the campaign of 1794 Boyen became confirmed in favor of light skirmishing troops as a part of every body of infantry, for he had there noticed that many of the Polish successes had been owing to loose-formation fighting. Kosciuszko, the great Polish leader, could have taught the Prussians many valuable military lessons gained by his experience in the American war, but the Prussian army of 1794 was not disposed to learn anything new from Poland, from America, or, least of all, from France. Only Jena made way for the new teaching.

Boyen in our day would have been a member of the Cobden Club and have devoted himself largely to advancing popular reforms. In his own he was regarded as a radical, if not a dangerous revolutionary character, tolerated by the King only because he was an exceedingly useful public servant. In creating the great army which fought against Napoleon, Boyen insisted, and successfully car-

ried his point, that there should be no distinction of rank or birth recognized among those who sought to serve their country. He was thoroughly opposed to the pretension that nobles alone could fill important military offices; in fact, he made the army a democratic institution, in which every man of every degree had to serve, and in which were no distinctions except those required for purposes of military discipline.

It would have been of great service to the student had Mr. Meinecke provided an index to this first volume of his, to say nothing of a map; but for such luxuries as these we must wait until such time as German scholars realize that labor is not in itself a great object, and that books are none the better for being difficult to read.

TWO WHITMAN BOOKS.

Walt Whitman the Man. By Thomas Donaldson. New York: Francis P. Harper. 1896.

Whitman: A Study. By John Burroughs. Boston: Houghton, Mifflin & Co. 1896.

Mr. Donaldson's book is a novelty in Whitman literature. We have had before books at once for him and against him, but none drawing the line between the more and the less admirable where Mr. Donaldson draws it. He reminds us of the good woman who thought little of Shakspere's writings, but admired the man. This is, if not precisely, very nearly Mr. Donaldson's attitude towards Mr. Whitman, as he invariably calls him, in refreshing contrast with the "undressed familiar style" his friends sometimes affect. His opportunities for knowing Whitman well were excellent—from 1862 to 1873 in Washington, and from 1873 until the latter's death in 1892 in Camden, N. J. His book deals almost exclusively with the Camden period. It will not be received with enthusiasm nor even gratefully by members of the Whitman cult, and yet no book or article written heretofore has given such an agreeable idea of the man. It was the man that attracted Mr. Donaldson. About the poet he was not so sure. "He did some things unusual, some things great, many things mediocre." But then Mr. Donaldson has known few men who are always great. "Col. Robert G. Ingersoll is one who never lets down, and always sits erect on his one distinct and concededly great saddle." Mr. Donaldson would not himself call Whitman's works poems, but "A Collection of Thoughts." The value of them lies in their democracy. Whitman groped at times for "something back," some knowledge of the universal mystery. "But, like all other human characters, he never found it, and has never expressed it." In general, Mr. Donaldson is convinced that as a poet and a writer Whitman has been taken much too seriously.

About the man he has much to say that is trivial; much, too, that is interesting and significant. Whitman was very poor for some years after he went to Camden, but was rendered as comfortable as he cared to be after his wants were made known. Mr. Donaldson lets all the left hands know what the right hands did, and the particulars are very creditable to human nature and to himself; for though he does not vaunt his prominence among Mr. Whitman's benefactors, neither does he conceal it. It may seem an exception to the statement that Whitman never asked for help, that he asked people to buy his "Author's Edition" for ten dollars, a most exorbitant price. Whitman's physical habits are given with the particularity of his own catalogues of the human anatomy and physiology. He was very cleanly, but equally untidy. There are facsimiles of his manuscripts in evidence. These he would roll up, tie with a string, and throw into the woodpile in the corner of his room. He did not use tobacco, and used wines and liquors with great moderation. "He used his knife as a divider and his fork to eat food with. He was not a sword swallower." Mr. Donaldson found him very simple, and unconscious of himself as a great man or beyond the common. "When he was eating off a dry-goods box for a table and drinking milk warmed over a coal-oil stove, and a few crackers with it, he would ask you to dine with the dignity of a prince, and never apologized for or mentioned the food." His house in Camden "was a coop at best," dear for the money that it cost, but selected because it had a tree in front of it and some lilacs in the back-yard. Then, too, it was near the ferries. It was in the business part of the unsightly town, but he thought it "a restful place," saying, with exceptional humor, that, "when he wanted almost entire seclusion and absolute rest, he spent the day in Philadelphia." A guano factory near by made the atmosphere intolerable for his visitors. "Did you ever smell anything like it?" said one of them. "And the old fiend sat there and chatted as though the balm of a thousand flowers encircled him."

As for his conversation, Mr. Donaldson admits and shows by example that it was meagre, slow, and very commonplace. Of course those who are members of the cult will say that he was talking with Mr. Donaldson and husbanding his pearls. "There were two Whitmans," says his friend, and it was unlikely, the cult will say, that Mr. Donaldson would find the deeper one, as did Messrs. Burroughs and Gilder and Stedman. One aid to conversation Mr. Whitman lacked to an extraordinary degree: "He read less of books than any man of literary pursuits I ever knew or heard of." Here was the negative basis for a towering egotism. Indeed, the enormous claims made for his originality often suggest more pointedly the narrowness of his critics' reading than anything else. But Mr. Donaldson protests again and again that Mr. Whitman as he saw him was not an egotist, except possibly in the last years of his life, when physically and mentally he was breaking down, and he resents Mr. Traubel's account of a dinner given him in 1891 as making his egotism appear much greater than it was.

On the side which Mr. Donaldson knew least about, Mr. Whitman was a silent, meditative man, who liked to be alone. To his nurse, who was with him a long time and was an excellent fellow, he had little to say. Women had slight attraction for him and children a good deal. There is one grindstone that Mr. Donaldson sees through with a perspicacity which has been denied to Whitman's admirers generally, viz., that if he was a poet *of* the people, he was not a poet *for* the people. "If Mr. Whitman has any popularity among the masses as a poet or writer, his book-sales fail to show it." "If his literary work is to live otherwise than as a book for thinkers and expounders, or as a curiosity, the present public opinion of him must essentially change. . . . The masses do not read him." His political convictions were at first Republican and afterward Democratic. "He looked upon the Northern abolitionists as generally fire-brands and inciters to insurrection, and full brothers in this to the Southern fire-eaters." The accounts of his hospital work are meagre and offer nothing new. After he came to Camden, his life, whatever it had been, was altogether clean and sweet. As to his earlier life Mr. Donaldson quotes his confession to John Addington Symonds that it had been "jolly bodily," with "episodes of passion and permanent attachment"; the second of these phrases being, of course, a paraphrase of Whitman's bill of particulars.

Mr. Burroughs's book is a very different one from Mr. Donaldson's. It has literary value, of which Mr. Donaldson's is innocent. But it has less of this than when he writes of birds and other natural things. Writing of birds, his style is sympathetically musical; writing of Whitman, it is often Whitmanese, and the effect is very droll. His book is the most elaborate study of Whitman's poetry that has yet been made. It is much fuller than Mr. Symonds's, and much more satisfactory than that upon the whole, but it deals less courageously with certain parts. It slurs the "Calamus" section of 'Leaves of Grass,' which troubled Mr. Symonds a good deal. He wrote that he could not have resisted the baseness of its implication if Mr. Whitman had not written him that his man-friendship rhapsodies were quite innocent.

Mr. Burroughs's estimate of Whitman is as exalted as any that has preceded it. He thinks it "highly probable that future scholars and critics will find his work fully as significant and era-marking as that of any of the few supreme names of the past." But he does not do much to justify himself in such a liberal estimation. His treatment is too vague, and the examples which he gives of Whitman's poetry are often damaging and discouraging. These and the extracts from his letters confirm the adverse judgment of Symonds on his taste. To say that it was execrable would not be too severe. The "Biographical and Personal" section gives a strong impression of Whitman's filial devotion to his mother, with an aggregation of hospital horrors in his letters to her into which Zola, when writing 'Lourdes,' might have dipped his pen for a more ghastly hue. The picture of his hospital work is very engaging, but omits the fact that his kisses and caresses were too soft for some of the soldiers of the manlier sort and were repelled. "With all his rank masculinity, there was a curious feminine undertone in him which revealed itself in the quality of his voice, the delicate texture of his skin, the gentleness of his touch and ways, the attraction he had for children and the common people." This hints at something true to which some persons would give a different interpretation.

In order to exalt Whitman, Mr. Burroughs finds it necessary to depreciate all other poets, but he can blame Whitman, too—a little—if only for the sake of giving to his page a more judicial air. In the matter of the Emerson letter he thinks Whitman was guilty of very bad taste. He concedes the egotism of the man more frankly than does Mr. Donaldson, and in some particulars unduly:

> "He enjoyed hearing himself lauded as Colonel Ingersoll lauded him in his lecture in Philadelphia, and as his friends lauded him at his birthday dinner parties during the last two or three years of his life; he loved to see his name in print, and items about himself in the newspapers; he sometimes wrote them himself and gave them to the reporters."

But in general the rejoinder on this head is the very stale one that Whitman identifies himself with the American population and

with universal man. There are many facts which do not fit into this theory. The charge that Whitman was a *poseur* is parried skilfully, but here also the concessions justify the charge.

There is much excellent criticism in Mr. Burroughs's book; it has many excellent rejoinders to criticisms that have been made upon Whitman's poetry; but it would be vastly more effective if it oftener gave us chapter and verse to prove the lofty claims he makes for his distinguished friend.

The Life of Roger Sherman. By Lewis Henry Boutell. Chicago: A. C. McClurg & Co.

THIS book, of 350 pages, is a timely and valuable contribution to the biographical literature of the country, not only for the record it gives of a distinguished statesman of the eighteenth century, but for the contrasts it offers to some of the features of the present time. The three most conspicuous figures in the history of Connecticut during that century were Jonathan Edwards, Roger Sherman, and Oliver Ellsworth. Edwards was born in 1703 and died in 1758. Sherman was born in 1721 and died in 1793. Ellsworth, the youngest of the three, was born in 1745 and died in 1807. Edwards's life covered fifty-two years, Sherman's seventy-two, and Ellsworth's sixty-two. Edwards undoubtedly had the most powerful and piercing intellect of the three. His great mental force was expended (not to say wasted) in constructing and expounding theological and metaphysical theories. Ellsworth was conspicuous as a statesman and diplomatist, but his dominant title to fame is to be found in his masterly juristical work in organizing the judicial powers of the Federal Government. He worked in a new field, with new materials, and the results of more than a century of the severest tests have demonstrated his claim to a high place among the most distinguished statesmen of the last century. Roger Sherman, of whose life and labors Mr. Boutell has given us a plain, clear, but not very animated sketch, was one of the most solid and clear-headed public men New England ever produced and honored. Though he was born in Massachusetts, his active life was spent in Connecticut and in the service of that State and the nation.

His education was exceedingly limited, partly gleaned from the "common schools" (and very *common* they were), and partly by his own efforts, unaided by others, so far as we can gather from this biography. He was a shoemaker and farmer, and worked with his hands till he was past twenty-two. Though he studied, or (as it was termed in those days) "*read* law," it does not appear that he ever practised much at the bar; but he successively, and often simultaneously, held and efficiently performed the duties of nearly every office of his town, county, city, and State, except those of Governor and Lieutenant-Governor. In addition to all these various occupations, he was also a merchant. His crowning title to eminence, however, is to be found in his services in promoting national independence and laying the foundations of the Federal Government. His labors in these fields were so conspicuous and successful that they are known to every tyro in our national history.

He had what has been termed the "genius of common sense." Though nearly destitute of book culture, as well as of what is called the "literary instinct," he had, what is vastly more valuable, a clear head and a quiet temperament, invigorated by an indomitable will. His sagacity in public affairs has rarely been surpassed. His moral nature seems to have been without a blemish, and to have operated as the guide and support of his public labors as well as his private life. Though religious in the best and mildest Puritan sense, he appears to have been absolutely free from cant and that fussy enthusiasm which blazes out suddenly and expires as suddenly. Considering his want of book knowledge and literary training, his speeches and writings exhibit a singularly clear, cogent style, and a comprehensive grasp of the questions—often great and complicated—which he discussed and expounded. He was not, to use an expression of Napoleon's, a "manufacturer of phrases," but he wrought in great public affairs with the same unerring skill and efficiency which he applied to the making of boots and shoes, raising corn and potatoes, and conducting his mercantile enterprises. In all the stages of his active and laborious life his integrity was absolute, and, as Marshall says of Washington, "was not only untainted but unsuspected." His word imported absolute verity, and it can be said of him, in the language of Lord Bacon, that his "mind turned on the poles of truth." He was as wise as he was straightforward, and his whole life justified the unique praise of one of his most distinguished contemporaries, that "Sherman never said a foolish thing in his life."

It is a circumstance as honorable to his fame as it is rare in human annals, that several of his descendants have proved worthy of their ancestor. Roger Sherman Baldwin, Governor and Senator in Congress and one of the ablest lawyers in Connecticut; William M. Evarts, Secretary of State, Attorney-General of the United States, and Senator; Rockwood Hoar, Judge of the Supreme Court of Massachusetts and Attorney-General of the United States; and the present United States Senator Hoar—all grandsons of Roger Sherman—have reflected light on the character of their ancestor. But reading this unpretending volume forces on us a painful contrast between Sherman and the other great leaders of his day and those who seem to direct our public affairs at the present time. An old chief justice of Connecticut, pious as well as learned, once said: "A Democrat is a stench in the nostrils of God." If he could arise from the grave and inspect the leaders of both political parties now, he would not fail to include in the scope of his caustic remark more than one party.

The effort of the author of this Life of Sherman to gather humorous anecdotes was not very successful; he had rather a barren field from which to glean. But he gives one very pretty story relating to Mr. Sherman's young daughter Mehetabel. When Gen. Washington was about to leave the house of her father on one occasion, the young miss opened the door for him. The General put his hand on her head and said, "You deserve a better office, my little lady!" "Yes, sir," she replied, with a courtesy, "to let you in."

The Monetary and Banking Problem. By Logan G. McPherson. D. Appleton & Co. 1896.

THIS book is the outgrowth of some articles published last summer in the *Popular Science Monthly* which received commendation from economists and bankers. While we can hardly expect anything very novel or original on so well worn a theme as this, there is always room for improved methods of presentation and for views from new standpoints; and in some respects Mr. McPherson's treatment of his subject is striking and suggestive. There is nothing more perplexing to the ordinary mind in the whole monetary problem than the manner in which the enormous mass of exchanges, all apparently for money, are effected by means of an extremely limited supply of that commodity. On this point Mr. McPherson is worth quoting. He says:

"This fact, that the total value called for by the paper representatives of value at any time in existence, although expressed in terms of the units of value originally designating coins, vastly exceeds the value of the metals as coined or held in bullion by the sources whence coins are issued, together with the fact that no man willingly and knowingly exchanges commodities for paper representatives of value without believing that he can obtain the worth called for by these representatives, leads to the perception that, after all, it is not the metals, however precious, but property of all kinds that is their basis, and that these paper representatives of value are superseding coins in designating and measuring the value of the commodities for which they are exchanged."

In other words, transactions by means of credit or the paper representatives of credit, although expressed in terms of money, are really dependent on the existence of property. Money is necessary only for small change; the use of drafts or checks might easily be extended far beyond its present limits. The inference is obvious that such a system as that of the Scotch banks is a natural development of commerce, and that legislation calculated to prevent or obstruct this development is unwise. According to American standards, the paper money of Great Britain is extremely limited in supply; were we to have so small a *per-caput* circulation, the outcries of the demagogues would rend the skies. But the prodigious business of Great Britain goes on without the least inconvenience from this cause. Theoretically, the currency may be called inelastic; practically, whatever elasticity is required is furnished by the increase or decrease of the number of checks and bills, together with the exchange of comparatively small quantities of bullion for banknotes.

Mr. McPherson contends earnestly that the value of commodities depends on the amount of human effort expended, under the law of supply and demand, in their production, and not on the amount of gold and silver that is in existence. It is unnecessary to consider what is involved in this theory, for it involves trains of reasoning far beyond the capacity of the class of readers for whom this book is intended. Much more practical is the author's account of the Canadian banking system, which he heartily commends. His book is written in a clear style, and with sufficient illustration to make it comprehensible to those unfamiliar with the subject; and as it is published in an attractive form, it will no doubt receive attention.

Talks about Autographs. By George Birkbeck Hill. Boston: Houghton, Mifflin & Co. 1896.

DR. GEORGE BIRKBECK HILL is known as the editor of Boswell's Johnson, of all similar editors the one who might best be called a Boswell's dignified Boswell. The qualities of mind that made him exalt Boswell's genius are agreeably revealed in his recent *Atlantic* articles, which now appear, with additions and illustrations, in a handsome volume. Dr.

Hill owns a fairly good collection of autographs. With this modest stock in trade and his own redoubtable knowledge of biography, he has ventured upon a kind of composition as yet little essayed, though not strictly novel—the *causerie* which turns upon nothing except an autograph. The author is so enamoured of this species that he thinks editing a scholarly letter would be an invaluable college exercise in literature. Dr. Hill's papers were on the whole worth reprinting, though the literary results are slender compared with the amount of commonplace. *Obiter dicta* form the tissue of the book, many trivial, others the interesting small-talk of a competent literary journalist, well-memoried and well-languaged.

There is no need of denying the axiom and the plea of collectors that in autographs much good literature and history is quietly inurned. Mr. Hill's own collection affords a good many little corroborations of well-known facts: that, for example, in Matthew Arnold liberal and conservative tendencies were painfully mixed; that Newman was peculiarly sensitive to the opinion of the world; that Froude was by nature incapable of strict accuracy and blind to criticism; that Southey, like Coleridge, combined exquisite sense of rhythm with insensibility to music; that Brougham left the Commons unwillingly; that Mrs. Hemans was too poetical for the strong taste of our masculine ascendants; that Garrison hated war as deeply as he hated slavery; that Gordon's greatness of soul extended to the least of his acts.

There is little in the book to excite adverse criticism. Dr. Hill's remarks about De Quincey are perhaps unnecessarily one-sided, and are certainly as severe as the facts warrant. "The Opium Eater" had undoubtedly an imperfect sense of the ethics of guesthood; but, as Mr. James Hogg has recently shown, De Quincey was capable of a delicacy of feeling concerning human relations which commanded the love of even the old Carlyle, the very man who reported with satisfaction Southey's savage words branding De Quincey as a traitor to the Coleridge family. In passing we may further note a slight slip of the pen, by which, in transliterating Ruskin's letter (p. 21), Mr. Hill has written *own* for *old*.

Joseph Thomson, African Explorer: A Biography by Rev. J. B. Thomson. Maps and illustrations. London: S. Low, Marston & Co.; New York: Charles Scribner's Sons. 1896. Pp. xv, 358, 8vo.

Joseph Thomson ranks next to Livingstone and Stanley among African travellers, not merely because of the magnitude and importance of his explorations, or of his extraordinary capacity as a leader, but also because of his singularly wise treatment of the natives. He started on his first expedition with the conviction "that it was not necessary, even in Central Africa, to sacrifice the lives of men in order to throw light upon its dark corners." At the end of his sixth, he was able to say that he had travelled thousands of miles amid savages, justly hostile to whites, "without shedding a drop of human blood." His career began at an unusually early period. At twenty-one he found himself, by the death of Keith Johnston, the leader of an expedition to explore the then almost unknown African lakes. Though without experience in the world or of men, other than his native Scotch village and two or three terms at the University of Edinburgh could give him, he accomplished all the work planned by the Royal Geographical Society. His crowning exploit was the crossing of Masailand to the Victoria Nyanza in 1883, for which he received the Founder's gold medal of the Society. Other expeditions were made up the Rovuma River on the east coast, and among the Atlas Mountains in Morocco, while diplomatic missions carried him to Sokoto and Gandu in the southwestern Sudan, and to the region west of Lake Nyasa in the interest of the Royal Niger Company and that of Mr. Rhodes. In addition he made numerous addresses to societies, and wrote, besides articles for leading monthlies, accounts of three of his journeys, a Life of Mungo Park, and, in collaboration, an African novel. This was certainly an extraordinary amount of work to be compressed into the narrow compass of eleven years. It was too much, for Mr. Thomson's strength was exhausted by the hardships he had undergone, and he died August 2, 1895, at the age of thirty-seven.

His brother has well told the story of this full life, and Mr. J. G. Bartholomew has contributed six admirable maps to the volume as a "tribute to the geographical work of his friend."

The Story of Architecture: An Outline of Styles in All Countries. By Charles Thompson Mathews, M.A., Fellow of the American Institute of Architects. D. Appleton & Co. 1896.

Of making many architectural books there seems nowadays to be no end. Half-a-dozen small general treatises on the long neglected subject have lately been published in the United States, three or four of them in 1896. The latest—we could afford to have it the last—Mr. Mathews's 'Story of Architecture,' takes in the whole field more broadly than most, essaying to treat the history consecutively, as its title claims, though the architecture of Cathay and America has not much to do with the story. This is done in a newspaper style, animated but rather slipshod, that may suit popular reading, but hardly justifies the existence of the book. There is an American readiness of apprehension and haste of execution in it, a sufficient knowledge of the main facts, a not very discriminating appetite for generalization, a narrow use of authorities, a loose chronology, and a good deal of inaccuracy in detail. The idea of the story is pretty well kept in the simpler parts of the history; but in the more complicated and critical parts, the accounts of the Romanesque and the Renaissance, the treatment is rather helpless. Here is an example of Mr. Mathews's success in generalizing: "These and other peculiarities [curvature of horizontal lines and inclination of verticals], by no means confined to the Parthenon, soon brought the Doric style great popularity throughout Italy, Sicily, Peloponnesus, and the Islands of the Ægean," etc. The hospitality of his selection is suggested by the fact that, of two and a half printed pages given to Greek Corinthian architecture, a page is used in developing the fable of Callicrates and his basket. These things may be efficacious in holding the attention of the persons who will read the book, but they do not help the story of architecture.

Impressions d'Egypte. Par Louis Malosse. Paris: A. Colin & Cie. 1896. 8vo, pp. 357.

The first part of this volume is a charmingly written description of the scenes which meet the eye of the tourist in Cairo and during a trip on the Nile. It abounds in felicitous expressions and pretty word-pictures, in which sky, river, desert, ruins, and the fellahin are harmoniously blended. Guide-book learning is conspicuously absent from it, nor is it the continuous narrative of a traveller. It is simply the recorded impressions of one who has been able to surrender himself completely to the subtle influences of the land, and whose perfect enjoyment is marred only by the swarms of vulgar tourists, pertinacious donkey-boys and backshish-seekers—upon whose persecutions he descants with humorous indignation—and the English soldier.

M. Malosse can never forget that it is England, and not France, which is the guardian of Egypt. In the second part of his book he enumerates at length the many evidences of the beneficent influence of his country upon the land in the supremacy of its language, in the constitution of the Government, in the results of the labors of French engineers and archæologists, in the numerous schools and colleges supported in part by French subsidies; above all, in the universal affection which she has inspired. At equal length he dwells upon the ill success of England, in her fourteen years of "tutelage," in winning even the confidence of the people. He in fact gives her full credit for but one thing, the increased efficiency of the army. Of the reforms of the courts, of the addition to the country's wealth through scientific irrigation, of the reduction of the burdens of the peasantry, with the exception of the abolition of the corvée, his readers are left in ignorance. M. Malosse is here simply the mouthpiece of the discontented pasha, and his book is a strong argument for the continuance of the English occupation. He says, for instance, "that if, for any reason, England should be led to evacuate the delta and the valley of the Nile to day, there would not remain, at the end of a period relatively very short, the slightest trace of her rule" (p. 287). That is, "on the departure of the last British soldier from Alexandria," the kurbash and the corvée would speedily be restored, the old courts where justice was sold reëstablished, the slave-trade revived, the new irrigation works abandoned, the annual surplus changed to an annual deficit, taxation increased by a third, the army rendered impotent, the fellah again made the prey of the pasha, and there would recommence the scandalous régime of another Ismail.

Outlines of Economic Theory. By Herbert Joseph Davenport. Macmillan. 1896.

It can hardly be claimed that the world stands now in pressing need of more economic text-books; unless, indeed, they are much to excel those with which we are at present furnished. The supply of treatises on economic subjects has of late greatly increased, and it would be as well to allow us to digest what we already have before enlarging the stock. The book before us may fairly be described as a respectable achievement; the author is well read, his grasp of economic principles is strong, and he understands the questions of the day. But we apprehend that his work may be found superfluous. Its merit is not so distinguished as to secure it a place in the crowded competition, and the "general reader" will be likely to give the preference to some such book as that which Prof. Hadley has lately published.

Nevertheless, a book of this description may meet certain requirements. It is apparently the outcome of class room work, and is fur-

nished with a copious list of questions, which are certainly calculated to stimulate reflection and research, if not to secure conclusive answers. If they may not bring out the truth, they will promote the search for truth, which, according to high authority, is even better. Another feature of interest is the quotation of passages of considerable length from leading economic writers at the end of each chapter. These passages are well selected, and constitute an agreeable reinforcement of the doctrines stated in the text.

The tone of the author is moderate and his attitude conservative. He is not attached blindly to the "orthodox" school, nor is he carried away by the learning of Germany. He is aware of the danger of present socialistic tendencies, but he does not ignore the existence of the evils that encourage socialism. Altogether, we are disposed to regard his book as wholesome in its influence, and while we cannot insist on its recognition, we shall at all events not begrudge its making a place for itself.

BOOKS OF THE WEEK.

Allen, C. D. Ex Libris: Essays of a Collector. Lamson, Wolffe & Co. $3.
A Peculiar Irishman. New York: *Truth-Seeker* Co. $1.
A Professional Lover. By "Gyp." F. T. Neely.

A REMARKABLE TRIBUTE TO A REMARKABLE BOOK.

Professor PAULSEN, in the course of an extended review in the *Deutsche Litteraturzeitung*, says:

"*If the real function of a History of Literature is to attract the reader to the literature itself, this work,* **'FRANCKE'S SOCIAL FORCES IN GERMAN LITERATURE,'** *will take a high rank among books of its kind. I must confess that I have not read any other History of Literature which so strongly inclined me to take up the authors myself. It is neither a dry summary nor a wearisome attempt to include every possible fact, nor does it abound in affected literary criticisms, or historical reflections about matters of course, but it puts the reader in the centre of the vital movements of the time. One often feels as though the authors treated of addressed themselves personally to him; the discourse coming not through bygone dead books, but rather through living men who seem to call out to him: I have something to say to you; I have a mission for my time and my people, and therefore one for you.*

"*The literary characterizations are not merely shadowy outlines of types or tendencies, but set men and their works in their concrete peculiarities clearly before our eyes, and in an extraordinarily lifelike way. The author has a great faculty for selecting characteristic extracts from the writers he treats of—a poem, a word, an opinion—to give his picture life and motion. The selections of poetical specimens seem to me especially happy; one feels that the verses are just the ones the author would have written under his own picture. Happy contemporary opinions are also thrown in to illuminate the author's position and his surroundings.*

"*Francke shows astounding readiness and breadth of sympathy in finding just the right point of view and just the right word for characterizing the most diverse personalities.*"

Greenwich, Conn. An ideal home for health and recreation seekers. Beautiful scenery; very accessible; moderate rates. H. M. HITCHCOCK, M.D.

The Nation.

NEW YORK, THURSDAY, JANUARY 28, 1897.

The Week.

THE Senate's hesitant and sullen attitude towards the arbitration treaty has greatly roused the religious press. All the denominational papers last week had emphatic and pointed remarks to make on the subject. It is a peculiar opportunity for such journals to do a great public service, and they are not at all backward about it. The *Independent* has some special dispatches from men of light and leading in England, like Messrs. Bryce and Lecky, urging ratification. On its cover, the *Outlook* prints an appeal to every subscriber to write at once to his two Senators to demand prompt ratification. The *Christian Advocate* does the same on its first page, and makes no concealment of its contempt for the base motives operative at Washington to obstruct the treaty. These are but specimens of what the religious press is saying and doing to show that its professions of devotion to the good of humanity are not idle. Its appeals are most timely, and we cannot doubt that they will be highly effective.

In connection with these appeals and remonstrances addressed to the Senate a strange theory has been broached. It is that it will not do to be too urgent or pungent, for fear that the Senate will reject the treaty out of sheer resentment. The situation is represented as a very delicate one. The pros and cons are being counted up, and it appears that there is a large number of doubtful Senators whom it would be very easy to exasperate into opposing the treaty if the newspapers say anything about it above a whisper. So we must all be very gingerly and diplomatic and mealy-mouthed, and take good care never to enrage our pettish Senators by looking hard at them. How absurd all this is! Is there no such thing, then, as a standard of official duty separate from personal pique? If the Senate can reject a treaty because pressed to ratify it, the same thing might happen in the case of any measure coming before it. We should then be in the situation of being compelled to keep silent about every pending bill, on pain of seeing it defeated if anything were said. The conception of the Senate as sitting in a high Olympic serenity, which it is dangerous to disturb by any outside clamor, is ludicrous. Outside clamor is the only thing many of the Senators care a fig for. If we all keep still, they will vote down the treaty and say they had no idea anybody wanted it ratified. So far as their outraged personal dignity is concerned, that is already enlisted against the treaty. They make no concealment of their desire to defeat it in order to wreak vengeance on the President and Mr. Olney. Are these the lofty legislators whose sensibilities we must be so careful not to shock? How did we ever get the Sherman silver-purchase law repealed except by the country's practically taking the Senate by the throat? The idea that we must all sit by in deferential silence till the Senate acts on the treaty, is the surest way to defeat it. It is a time to speak out, and to speak out loud. The Senate will not dare to reject the treaty in the face of a pronounced public sentiment in its favor; and we must remember that a public sentiment without voice or pen or threat is practically non-existent.

That colossal fabric of fraud and folly, the Nicaragua Canal bill, fell in ruins on Friday and buried Senator Morgan underneath, leaving him gasping and stuttering: "England is at the bottom of it; I'll vote against your arbitration treaty anyhow." Really, Morgan himself is at the bottom of it, and how he will ever get out it is impossible to see. The cause of the catastrophe was a communication from Señor Rodriguez, the Minister of Nicaragua, or of the Central American Republic of which Nicaragua is a part, to Secretary Olney, who transmitted it to Mr. Sherman as chairman of the Senate committee on foreign relations. The latter, although a friend to the project for a Nicaragua Canal, thought that the American people whose money was involved in the pending measure were entitled to know the facts; so he caused the letter to be read at the clerk's desk. Now the supporters of the bill say that this is fresh proof that Sherman is losing his mind; that the communication was a confidential one, and ought not to have been made public. Why should it not be made public? The Nicaragua Canal bill was a public measure. The debate was not in executive session. The reports upon which the debate was proceeding had all been published. All the lying that had been done had been public lying. Why should not the truth be made equally public? Señor Rodriguez, on the other hand, denies that his communication was intended to be confidential, or that he has any feeling of surprise or displeasure at its publication. On the contrary, he says he assumed that it would be transmitted to Congress, and would be made public in one way or another.

Señor Rodriguez's letter presents three main objections to the enactment of the bill by the Congress of the United States. These are (1) that the canal company has no rights in Nicaragua except such as are derived from a contract with the Government of that country dated April 24, 1887, which has already expired; (2) that the contract provided that the control of the canal should not be transferred to any government, whereas the pending bill provides for its transfer to the Government of the United States without the consent of or any consultation with Nicaragua; (3) that the contract requires the delivery to Nicaragua of 6 per cent. of all the securities issued or to be issued for the construction of the canal, which provision was wholly ignored in the pending bill. There were some minor objections to the bill which need not be recounted. The contract, Señor Rodriguez says, was forfeited both by failure to make the final surveys for the location of the line of the canal in the manner provided therein, and by failure to complete a specified amount of work within a certain time. In regard to the final surveys and location of the line, he says that whereas the contract provided that two of the engineers should be appointed by the Government of Nicaragua, the pending bill provides that they shall all be appointed by the President of the United States. "This provision," says Señor Rodriguez, "likewise conduces to the forfeiture of the contract." In other words, the pending bill ignores Nicaragua completely, and disposes of her land, her franchises, and her money as though she were one of our Territories like Arizona or Oklahoma.

This is wonderful, but still more so is the fact, commented on with biting severity by Senator Vilas, that Senator Turpie had pointed out all these defects, inconsistencies, and incapacities in a speech which had occupied parts of three days in the Senate, but had been delivered for the most part to empty benches. Mr. Vilas expressed the opinion that it had been the intention of a majority of the Senate to go ahead and pass this bill binding the United States to guarantee $100,000,000 of the bonds of a company that had no legal existence, no right to build a canal in Nicaragua or anywhere else in the world. Although a member of the Senate had taken the pains to point out these disabilities in convincing terms, the majority had declined even to remain in the Senate while he was speaking. And yet some persons, like Mr. Hoar, are very touchy when any newspaper or educational institution hints that the Senate is not attentive to its duties and that it has seen better days. Mr. Frye seems to be equally nervous. We strongly suspect that both of them intended to "go it blind" on the Nicaragua Canal bill, and would have done so but for the timely coming of Señor Rodriguez's letter.

Senator Turpie's remarkably good speech against the Nicaragua Canal bill causes us to regret that he lost his balance last week and caused several other Senators to lose theirs. Mr. Turpie had seen something in a Washington newspaper which implied that Secretary Olney and Senator Sherman (who is supposed to have been designated as Olney's successor) had come to an understanding that there should be no action by Congress on Cuban affairs at this session, so that the new Administration should have a free hand in dealing with it. He thought that this proceeding called for a protest on the part of Congress, etc., etc. Senator Sherman assured him that the printed story was false from the beginning, and here the incident might properly have terminated, but it appears that several Senators were loaded on this or cognate subjects, and they "went off" in rapid succession. Senator Hoar had received a communication from some educational institution insisting on prompt ratification of the arbitration treaty. Such doings on the part of college professors, clergymen, and other meddlers he considered ill-judged and in bad taste. In this view he was supported by his colleague, Mr. Lodge, and several other Senators. Senator Gray, on the other hand, thought that it was a good and wholesome sign to find the people interested in the work of the Senate. He was disposed to welcome that sort of "interference." He thought we did not have any too much of it, and he ended by asking Mr. Hoar what he proposed to do about it. "We can at least let the authors of this sort of premature agitation know that they are making a great mistake," replied Mr. Hoar. Now we do not believe that the authors of this agitation will ever agree with Mr. Hoar in considering it premature, however severely he may remind them that it is. That the Senate, which is a part of the treaty-making power, should take due time to deliberate upon this treaty, is not to be gainsaid, nor do we think that an unreasonable time has been occupied with it in the committee on foreign relations. Nevertheless, the spurring that it has received is, as Mr. Gray said, a sign of healthful public interest in an important public matter. So far from causing irritation on the part of the Senators, it ought to be received by them with joy and gladness.

There is much rejoicing among Northern Republicans over the reëlection of Senator Pritchard of North Carolina, but no sound-money man can view it with satisfaction. He owes his success entirely to his virtual acceptance of the Populist creed, having secured the support of enough Populist legislators to give him a majority by promising to vote for free coinage at the ratio of 16 to 1. The only reservation which he makes is, that he will not insist upon a free-coinage rider to a tariff bill. If the elections in other States result as is expected, the Republicans will have with Pritchard 45 votes out of 90 in the next Senate, counting Teller and other former Republicans except the two Nevada Senators on that side; 46 if the Kentucky Legislature shall finally choose a Republican, and 47 if the Senate shall reopen the old controversy over the vacant seat from Delaware and seat Du Pont, whose claims were rejected a year ago.

The general impression among intelligent persons to-day is, that there is not much use in further argument with the persons in power in this State; that they are governed by a class of considerations which cannot be publicly revealed or publicly discussed, so that the work of any critic of public affairs, as far as regards them, has, for practical purposes, ended. The main work of a journalist with regard to them now is simple description of what they are doing and what they say. We find among the great multitude of despondent people only one source of comfort, and that is that the worst has come, and that, if American affairs follow their usual course, we must now be on the eve of improvement. We have apparently reached bottom, and any change hereafter must be for the better. With a Governor like Black, a common Troy politician, denouncing the "civil service" for having too much "starch," and assigning a notorious rogue to the place in the State service which affords largest opportunity for bribery and blackmail, for the simple reason that he secured his (Black's) nomination for the governorship, with a Senate confirming the appointment, through simple unwillingness to "antagonize" the Governor in his first year, and with a United States Senator elected for his skill in distributing blackmail, we shall clearly have reached the lowest point in the degradation of the State. These men can do nothing more without bringing on the interference of the courts, which, thank God, are still pure and upright. What they would doubtless do next, and what they logically ought to do next, if they had the power, would be to muzzle the press and close the churches and schools. But they must stop where they are until we get a chance at them at the polls.

We must all hope heartily that President Low's prophecies as to the excellence of the New York charter, uttered at the Princeton dinner, will be fulfilled. We could not refute a prophet if we tried, and we are all, both makers and critics of the charter, in favor of good government. But on one point we must "carp" at him a little. He testifies to the "faithfulness" and "singlemindedness" of the members of the draft committee, "without a single exception," evidently intending thereby to put Gilroy on the same level with himself and the others. But Gilroy's "faithfulness" and "singlemindedness" in the work of the committee do not meet the objections we made to his presence in that body. Gilroy only two years ago proved himself the most unfaithful Mayor New York has ever had. His appointees were so shocking that they had to be legislated summarily out of office on account of their badness. No such stigma that we can recall, in municipal history, was ever inflicted on a Mayor. He may have been "faithful" in drafting the provision for the Board of Improvements, but he appointed the worst Commissioner of Public Works we have ever had, in the person of a drunken and uneducated furnace-man. Nothing like this has ever happened in New York. He may be a good adviser on financial questions, but he is living in luxury without occupation, having supported a family of at least ten children on a small salary, but after making extensive asphalt contracts through Mike Daly.

President Low's chapter on "Municipal Government," in Bryce's 'American Commonwealth,' is so completely at variance with the position now held by him on the municipal-assembly provisions of the new charter, that we think he owes it to the public to make some explanation of his change of view. He took in this chapter precisely the position which we hold upon the proposal of the charter for a two-chambered assembly, namely, that experience has demonstrated the uselessness of hoping for good results from such bodies. He said that "whether these bodies have been composed of one house or two, the moment a city has become large they have ceased to give satisfactory results," and that "as a rule they have so far abused the large powers given them, in order to carry out to the utmost the idea of local self-government, that almost everywhere the scope of their authority has been greatly restricted." In regard to New York city, he said that every important function had been taken away except that of granting franchises; and if he had been writing a few years later he would have said that this also was restricted because of the scandalous abuses which its possession engendered. What are the considerations which have convinced Mr. Low that better results can be looked for now than at the time at which he wrote, which was only six or seven years ago? Why does he think now that it is desirable to disregard the results of experience? He must have reasons for his change of faith, and as there are thousands of people in the community who look with confidence, and properly so, to him as a leader in matters of this kind, he owes it to them to make these reasons public.

The following words, which stand at the head of the act of last year under

which the Charter Commission is doing its work, are worth considering at this time: "Passed without the acceptance of the cities of New York and Brooklyn." What this sentence records has perhaps been forgotten by many of our citizens. The act creating the commission and decreeing consolidation was submitted, as the Constitution requires, to the mayors of the two chief cities affected, and, after public hearings upon it, was returned to Albany by them with their disapproval. It was then "jammed through" the Legislature a second time, as it had been a first time, under the lash of Boss Platt. The commission has consequently been doing its work against the wish of the two cities most concerned, as expressed through their official representatives. This fact of itself is a sufficient reason why the charter, when completed, should be submitted to the people of the territory affected for ratification or rejection. The people of the two cities most concerned should especially be given this privilege, since, so far as they have been able to express their will thus far, they have expressed it against the work of the commission. To force them to accept the findings of a commission whose appointment they officially disapproved, without an opportunity to say whether they like it or not, is certainly not democratic government, whatever else it may be.

The vote by which consolidation was decreed was far from being a conclusive demonstration that the people of the territory concerned were in favor of it. The total vote in this city was only 166,505, and the majority in favor less than 37,500. Only about three-fifths of the people voting in the election expressed themselves at all on the subject. In Brooklyn the verdict was much less conclusive, for the majority in favor of consolidation in that city was only 277 votes in a total of 129,466. Nobody can deny that, at the time this vote was taken, very few people in this city had thought seriously about the subject. They certainly had not thought at all about the form which consolidation would take, or about the details of the new government which would have to be formulated. It is absurd to say, in view of these facts, that they must accept, at the hands of a boss-controlled Legislature, which has disregarded their expressed wishes in the matter, any form of government which the boss may choose to give them. If they were entitled to a voice on the question of consolidation, they are entitled also to a voice on the question of the government under which they are to live after consolidation has been effected—all the more so because that government has been formulated by a method of which they have expressly disapproved.

The *Times* publishes an interview with Mr. Haas, President of the Sloss Iron and Steel Company of Alabama, touching the proposed revision of the tariff. "Alabama iron needs no duty at all," says Mr. Haas. "It is underselling English iron in the latter's own country, and is laid down in New York, freight paid, at the price asked for English iron, plus the duty, at the English furnaces, and much cheaper than English iron with the freight added. If the Sloss Company takes any action at all, it will be to ask for a reduction or total abolition of the duty on iron." It is evident that Mr. Haas has been bought with British gold; that is, with the gold that the Britishers are paying him for his iron—in monthly instalments, no doubt. How else can we account for the fact that he is willing to consent to an entire abolition of the duty on iron? Is he not up to the trick of selling his iron to foreigners at lower rates than to Americans? If not, he can learn something to his advantage by joining the steel-rail combine.

The report of the Spanish Minister for the Colonies accompanying the decree granting administrative reforms to Porto Rico makes incidental acknowledgment of the extent and strength of the Cuban insurrection. In this respect it goes farther than any official Spanish utterance which we can recall. It admits that the rebellion was "from the first vigorous and menacing," and now, after nearly two years of tremendous exertions by the Spanish Government, all that is predicted is the pacification ere long of "the most populous parts of the island." The reforms extended to Porto Rico are in the form of decrees changing the organic law so as to give greater local control, both administrative and financial. Detailed regulations are to follow. The whole is frankly acknowledged to be but a qualified home rule. Not only is Spain's supremacy to be guarded, but, practically, her right to interfere and dictate wherever she pleases. The elastic phrase of the Queen's speech is, "provided always that the rights of sovereignty are maintained intact, along with the *conditions necessary* to continue them in force." Home rule such as Canada enjoys has never been contemplated. The greater measure of self-government conceded to Porto Rico will be extended to Cuba as soon as the insurrection is stamped out—perhaps before. There seems no likelihood, however, that the Cubans will now be satisfied with anything of the kind.

Russia's preparations to adopt the gold standard are described in the last budget report of the Minister of Finance. He refers to the conflicting rumors set afloat about serious changes in the plan, if not its temporary abandonment, but affirms that the main purpose—to fix the price of paper in gold—cannot be changed. M. Witte admits that some features of the plan are undergoing revision by the Council of State; but the chief thing is to accustom the Russian commercial public to the gold standard. This has been accomplished, in part, by the gradual assumption by the State Bank of the duty of cashing paper money in gold on demand, at the rate of 1 ruble gold to 1½ in paper. While the total note circulation amounts to 1,121,300,000 rubles, the Treasury's stock of gold now stands at 804,000,000 rubles, of which an amount equal to 70 per cent. of the paper currency is designated for its redemption. The Minister's description of the financial condition of Russia is rose-colored; the receipts, according to him, having risen far beyond the estimates, with everything promising in the future. Some of his statements are rather sharply challenged by the London *Economist*, though it admits that the success of the Siberian railway and the surprising agricultural and industrial developments along its line almost justify the Minister's extravagant prophecies.

There is a "Plate-Glass Bevellers' Trade Union" in London which recently brought on a strike against Messrs. Bailey, glass-silverers and bevellers. The strikers forthwith proceeded to "picket" the Messrs. Bailey's premises. About forty or fifty men surrounded the house, trying to get the remaining workmen away, intimidating and assaulting the new arrivals, following Bailey's brougham with hooting and yells, and marching past with banners. All this, according to Judge Wendell Holmes, they had a right to do if their motives were good—that is, if they intended, not to annoy the Baileys, but to improve their own condition; a Jesuitical distinction over which Pascal makes very merry in the Provincial Letters. All strikes of this kind are based on the assumption that men in Bailey's employment have a moral right to stay in it as long as they please on their own conditions, no matter whether Bailey wants them or not—a doctrine which lights up "Christian socialism" with a ray of humor. If it were applied to any other relation in life except that of employer and workman, it would fill the land with laughter. But the Baileys brought an action against the secretary, assistant secretary, the treasurer, and members of the executive council of the union, before a special jury in the Queen's Bench division. After the plaintiffs' evidence had been heard the union gave in, and acknowledged their fault, and asked the jury to assess the damages, which the jury did, and made them at $3,370, but the Messrs. Bailey said they never expected to get a cent of it. However, they got a perpetual injunction against the strikers, so that if these annoy the Baileys any more, they will be locked up.

FOR SECRETARY OF THE TREASURY.

We have not exerted ourselves overmuch in helping Major McKinley to form a cabinet, nor do we intend to begin now; but we shall briefly indicate some of the qualifications needed in the Treasury Department, in the absence of which there will almost certainly be trouble, both financial and political. A glance at the situation of the Treasury will show what is required of a Secretary, and how necessary it is for the success of the Administration that he should possess both financial training and decision of character. The first fact that confronts us is the deficit. Receipts are not equal to expenses. Worse still, Congress is incapable of either adding to the receipts or lessening the expenses. This is the most depressing fact in the situation. There is a large sum in currency in the Treasury, the proceeds of bond sales, which Congress seems determined to spend on public-building jobs, or river-and-harbor jobs, or Nicaragua Canal jobs, or in other ways, while doing nothing to choke the deficit, although the trouble might be cured by a bill not larger than one page, either by a few additions to the internal taxes or to the *revenue* items of the tariff. The reasons why this is not done are very plain, but we will not consider them now.

The fact that profligacy, deficit, and imbecility are running together is what confronts us. This is the first fact that the new Secretary has to grapple with. How shall he do it? Senator Sherman said at the last session that he ought to refuse to pay out more money than he takes in, no matter what the consequences might be. This policy implies that the Secretary shall select among the appropriations of Congress the ones to be paid and allow the others to pile up behind him. This is what Secretary Foster did in the last year of the Harrison Administration. The deficit, as everybody knows, was produced by the McKinley tariff. Its declared purpose was to "reduce the revenue," and it accomplished its aim and rather more. The borrowing policy enabled Secretary Carlisle to pay up the accumulated bills of his predecessor and to meet the extravagance of Congress. The time has come now to stop this spendthrift career. We need a Secretary who will give public notice that he will pay no bills in excess of his income. It is not at all certain that the forthcoming tariff bill will choke the deficit. So far as we are able to judge, public revenue is not the main thing to be considered in that measure. It is still uncertain whether the measure itself can pass the Senate in the shape that it comes from the House. Even if it does pass, the amount of revenue derivable from it will be an uncertain quantity for a year or more. For these reasons the new Secretary must be a man of resolution—one who will take a position regarding the balance between income and outgo, and maintain it at all hazards.

This is all the more necessary since the maintenance of gold payments depends upon it. If the recent election decided anything it decided that the gold standard should be maintained. It cannot be permanently maintained by borrowing. Everybody recognizes this fact. The reason why the Bryanites are so madly opposed to borrowing is that it enables the Government to maintain the gold standard. An end must come to borrowing, however. Public opinion has sanctioned it as an emergency measure, not as a permanent resource. The new Secretary must be a man versed in financial science and skilled in the art of presenting it to Congress and the public. The greatest problem that confronts the new Administration is that of settling the money question so that the Treasury shall get back to its original and proper function of collecting and disbursing the public revenues, and shall abandon the attempt to do a quasi-banking business in addition, which it took up in the stress of war. To get back to safe moorings, so that the business community shall not be in a constant tremble about the standard of value, is a matter of extreme delicacy. The Secretary of the Treasury ought to be a man who can speak with authority on questions of this class. He should be a man on whom Congress would lean for information and guidance as to doubtful points in banking science.

Such a man is Mr. Lyman J. Gage of Chicago, who does not seek the office, but, it is gratifying to observe, would not refuse it if it were tendered him, as seems possible. The choice of him would be interpreted to promise an earnest and intelligent effort on the part of the new Administration to carry out the purposes which the people had in view when they gave their votes to the nominees of the St. Louis convention. It is safe to say that Mr. Gage is a believer in the gold standard without any ifs or buts. He is not for bimetallism, national or international. He is a believer in a banking system regulated by, but otherwise independent of, the Government. We judge that he is in accord with the financial policy marked out by the Indianapolis conference. We draw this inference from the fact that this platform is supported by the group of business men in Chicago with whom Mr. Gage has always been associated. We believe that it was the intention of the promoters of the Indianapolis conference to ask Mr. Gage to serve on the proposed commission to prepare a plan of currency reform, not because he favors any particular plan, but rather because he is not committed to any particular plan. It is needless to say that, in the higher position to which he seems likely to be called, he will have the cordial support of the men composing that conference and of the commercial bodies which they represented. This means a great deal. It means that the business interests of the country will be united in support of the new Administration at the beginning of its term. Whether this support will last will depend on what is to happen later, but with Mr. Gage at the head of the Treasury there can be no doubt that the Administration will start under the best auspices.

We think, too, that Mr. McKinley will find in Mr. Gage the stanchest supporter of what the Governor of New York calls "civil service." In the efforts made with such success in Chicago to promote the merit system of filling public offices, Mr. Gage has always been a zealous worker, as in all other public-spirited enterprises. In short, he represents a high type of American citizenship, of the kind which neither seeks office nor avoids it. We presume that he would prefer not to be Secretary of the Treasury or anything else than what he is now, but that he does not feel at liberty to decline the position if his friends think that he can be useful to his country. It is a fact, too, that by taking the office he will make a heavy pecuniary sacrifice.

If the national finances were not in a critical state, it would be idle to expect that such a man as Mr. Gage would be called to the chair of the Treasury. If it were all plain sailing, some politician would probably be chosen, somebody skilled in manipulating conventions, getting votes at primaries, and distributing offices. Mr. Gage has no fitness for those employments, but, on the contrary, the greatest possible aversion to them. His selection for the place, if he be selected, will be a tacit acknowledgment by the President-elect and his party that there is something wrong with the finances, and that unless it is righted during McKinley's term there will be disaster at the end of it. Still, we must not expect too much. All that any Secretary can do is to recommend wise policies to Congress. He will have influence—indeed, his position as well as his personal reputation will give him that; but he cannot do everything. He will not have a bed of roses.

THE DECLINE OF CONGRESS.

Senator Cabot Lodge has been writing in the *Herald* a protest against the prevailing notion that the oratory and legislation of Congress have fallen off. He says:

"It is habitual in the newspapers and in conversation to sneer at the debates in Congress, as it is at everything connected with that body, and to speak of it always, as Mr. Maclay did of the first Senate in our history, and as succeeding Maclays have spoken of every Senate and House, as degenerate. Yet I have noticed a general willingness on the part of American citizens to accept a seat in either branch of Congress, and even a disposition to struggle for a place in this degenerate assembly. The truth is, that if any one will take the trouble to follow the debates—a privilege which the general public does not

now enjoy—he will find that, while there is unquestionably a certain amount of ignorance and cheap talk and empty declamation inseparable from any popular representative assembly, the discussion on the whole is carried on vigorously and effectively, and with a great deal of special information on the many and varied subjects which come before both the Senate and the House."

This suggests very strongly the remark that it is nearly as ridiculous for a member of Congress to go about maintaining, against the general opinion, that the body to which he belongs stands as high as ever, as it would be for an individual to go about maintaining that he was a far greater man than people thought he was. In the matter of reputation, the maxim, *securus judicat orbis terrarum*, is, as a rule, as correct as ever, with regard both to public and private men. Men or assemblies are almost without exception what the world, after long years of observation, considers them. The efforts of a man to dispute the prevailing opinion about his own merits either as orator, statesman, or legislator, are generally extremely ludicrous, and end in consigning him to lower depths than he could reach in any other way.

The reputation of Congress is not based on its oratory, because the public does not hear it. It is based on its conduct as a legislature; and the popular opinion about its oratory is a deduction from its statesmanship. People conclude, perhaps too hastily, that a man who acts like a fool cannot make a good speech. Mr. Lodge's conclusion, that Congress cannot be so bad because so many people want to get into it, is a fair specimen of the reasoning which has brought the Senate into disrepute. It reminds us of Horace Greeley's opposition to the increase of the salaries of the judges, on the ground that plenty of judges could be got for half the amount. It would not be possible for Congress to sink so low that thousands would not seek seats in it, as long as the salary of Congressman was $5,000 a year. The idea that the place is sought on account of the high reputation of the body approaches perilously near a joke. Besides this, everybody knows how Congressmen are selected. The fact that McClellan and Quigg sit for New York is full of instruction. It throws more light on the character of Congress than any number of illustrated articles.

Among the things which of recent years have brought the Senate into disrepute are, not bad oratory, but silly and corrupt legislation, such as the purchase of $4,000,000 of silver a month for simple storage in order to help the silver-miners; obstinate resistance for months to the repeal of this act, in defiance of the pronounced opinion of the country, and indifference to the effect on business; the introduction of a resolution by a prominent Senator (Mr. Lodge himself) proposing to put a discriminating duty on the goods of a friendly nation in order to force it to change its standard of value; and the instantaneous "standing behind Cleveland" in the Venezuela affair. This deserves more than a passing mention, because the Constitution put the power of declaring war into the hands of Congress in order to secure deliberation. Although Mr. Cleveland's message declared his intention to draw a frontier line for a friendly nation against its will, and to defend such line by force, and although it was considered a hostile message the world over, Congress, which knew nothing of the merits of the dispute, instantly voted him the money to carry it out, without any inquiry or deliberation. This was done, too, in spite of the often declared dislike and distrust of the President and his Administration by the majority. People naturally contrast with this the slow and unfriendly consideration bestowed on Mr. Cleveland's recent message of peace in the shape of the arbitration treaty. Months for peace, ten minutes for war, although the function of a legislature is not to fight, but discuss.

Another cause, and not the least of the causes of the popular contempt for Congress, is its inability to perform one of the primary duties of a modern government, namely, to regulate the finances and protect the credit of the country. Eighteen years have elapsed since the restoration of specie payments, which was only one step towards the curing of the financial disorder caused by the war; the others were the redemption of the remaining Government obligations, and the permanent release of the Government from the duty of maintaining a reserve for commercial purposes. In that interval Congress has shown itself totally unable to formulate any financial policy and pursue it. No man has arisen to a position of commanding influence in it on financial questions, and the talk of most on such questions has amused mankind and inspired distrust among investors. The time which was due to financial reform was passed in buying bar silver and treating the metal as a living entity. Another one of the leading functions of government is the protection of credit, that marvellous force which has come into existence almost in our own day, and is now the chief source of national prosperity. It is the principal care of every civilized state to-day, and probably the principal cause of the inactivity of the enormous modern armaments. Our Congress has for years displayed nearly as much indifference to it as Turkey, and has not hesitated to discuss and pass resolutions threatening interference in foreign affairs, which disordered the business enterprises and expectations of the whole country, and which no intelligent man expected to lead to any result. The author of the last of these has acted so suspiciously, by flight from the debate which he invited, as to spread the belief that he introduced it as a stock-jobbing transaction.

Most of these observations apply to the Senate only. We need hardly say more of the House than that seven years ago its presiding officer declared, with thanks to God, "that it was not a deliberative body," in order to secure the passage of a bill which many, including Senator Lodge, defended on the stump because it was likely to produce dearness of commodities, and which ended in producing out of doors the overwhelming defeat of the party. If the House be not a deliberative body, what is it? All popular assemblies which are not meant to deliberate, and are not organized for military purposes, under defined command, are necessarily mobs, and the day is distant, we trust, when civilized men will respect mobs. We have here recalled only a small portion of the things which have exposed Congress to popular contempt, and the remedy is not to write articles saying it is wise and eloquent, but to *be* wise and eloquent. Its career for the last ten years has caused great national despondency and distrust, which cannot be removed by self-praise.

A SOCIALIST EXPERIMENT.

On the 1st of August in the year 1895, a great strike broke out in the Ste.-Clotilde glassworks at Carmaux, in France. This was occasioned by the discharge of a workman, named Baudot, who had been absent from the shop without permission for a fortnight in order to take part in the Socialist Congress at Marseilles, to which he had been sent as a delegate. His fellow-workmen sympathized with Baudot and made common cause with him, and as another delegate, Pelletier by name, of Bousquet-d'Orb, had also been discharged for the same reason, the workmen of this second shop followed the example of Carmaux, and the strike became general. The whole Socialist party took up arms in behalf of the workmen, and many of its leaders installed themselves at Carmaux in order to direct the strike. They were opposed by M. Rességuier, the manager of the Ste.-Clotilde works, an able and resolute man, who put all his energy into the fight.

The usual incidents of a strike followed: assaults and violence of all kinds, general turmoil, and the destruction of business; and anarchy reigned for several weeks. At last, on the 1st of October, the management determined to light a single furnace. To this end it had recruited a new body of workmen at Bordeaux and at Rive-de-Gier, some of them being drawn from an independent half-Socialist workshop at the last-named place. After this, men, some of them from Carmaux itself, offered themselves for work in such numbers that a fortnight later a second furnace was lighted, and on the 11th of November a third, manned exclusively by Carmausins. The strike, in fact, was broken and defeated.

At this point, on the intervention of M. Jaurès, the Minister of the Interior (who

at that time was M. Bourgeois), sent down to Carmaux the director of the Sûreté Générale, M. Poirson, to ask the management of the Ste. Clotilde works to take back all the strikers and give them employment together with the new workmen, reducing, if necessary, the number of hours of labor or the number of days' work in the week. The management refused. M. Jaurès thereupon declared that "the glassworkers of Carmaux would go back to the shop only when they had founded a *Verrerie ouvrière* which should be an asylum for their militant brethren, and when the public power should have taken such measures as were necessary to assure syndical liberties." A bill to meet the latter purpose was, in fact, introduced into the Chamber of Deputies by the Socialist group. In the meantime the fourth and last furnace of the Ste.-Clotilde works was lighted. All the strikers came back and asked for work. The management made its choice. Three hundred and twenty persons were left unemployed, victims of a strike essentially political. In order to give work to these 320 persons the Socialist party determined to create a *Verrerie ouvrière.*

The first step was, of course, to get together the necessary capital. This proved to be a not very difficult task, and was accomplished mainly through the energy and activity of M. Henri Rochefort, though not much of the money came from his own well-filled pocket. A certain Mme. Dembourg subscribed 100,000 francs, 205,000 francs were brought in by subscription tickets at a franc apiece, other considerable sums were granted by workingmen's societies, so that on the 26th of last October, when the *Verrerie ouvrière* was inaugurated, its direction had 415,000 francs either in hand or in the plant. There had been a good deal of discussion as to the place where the new works should be begun. Carmaux had suffered greatly from the strike, and naturally was anxious to reap whatever benefit might accrue from the new venture. But another town near by, only sixteen kilometres off, had been almost destroyed by the great strike of 1882, in which the town had lost through emigration some 8,000 of its inhabitants. One whole quarter of Albi had become as desolate as a graveyard, and land there had almost lost its value. What influence this had on the location of the new *verrerie* we do not know, but the foundation was made at Albi and not at Carmaux.

Another preliminary question that caused some trouble and much debate among the chiefs of the party, was the determination of the end to which the profits of the new shop should be devoted. It was thought dangerous to divide them among the workmen, and so expose them to the temptation of becoming capitalists themselves. This question was finally settled by agreeing to turn in all such profits to the treasury of the Socialist propaganda. At last the works were formally opened with much oratory on the part of the eloquent M. Jaurès and his associates. It is said that no glass was made on this occasion, but a good fire was built in the furnace, and the chimney smoked. The glass-making part of the works, in fact, is hardly yet in full running order, and many of the glass-workers have been and are still engaged in the construction of the buildings. Perhaps no glass-working would have been done yet if an order had not been received from an important house in the east of France for 200,000 bottles; for, after all, the money which the syndicate had in hand was not enough to justify them in lighting their furnaces. With this order as security they were able to borrow 100,000 francs from the enemy, as it were—that is to say, from a great Paris bank—and this is their working capital. This step must have been painful, but it was necessary, and yet it was only a beginning of troubles.

The Albi of Socialist dreams was to be a paradise. The yoke of the tyranny of the patron was to be shaken off, workmen were to lead there a quiet, peaceful life, of perfect freedom, with but faint memories of their troubled past. No abuse of power would occur there, no painful restrictive rules, no fines, no sudden discharges. The régime of the Rességuiers was passed away and done with for all time. The facts unhappily correspond but faintly to the dream. The workmen at Albi found from the beginning in full force a directive authority far more rigorous than the old patron was, a table of rules more Draconian than any they had ever known. Even the sacred right of grumbling was taken away from them. Far from being allowed, as before, to curse the patron, or insult him, or even call him a blood-sucker, they are now forbidden to indulge in any injurious criticism upon the directory, under pain of suspension or dismission. Four workmen have just been sent away for this reason, and that is not the only constraint to which the workmen have to submit. The internal regulation of the shop is very severe, and its discipline is very strict. In the old days they protested against fines and were constantly demanding that these should be abolished; now they have to pay, and pay dear, for the slightest tardiness or absence. They find, to their surprise, that the little finger of their present masters is heavier than the whole hand of the masters against whom they rose.

These are the first results of the Socialist experiment at Albi. What does the story teach? Nothing but an old lesson, drawn from long human experience, easy to be seen and read of all men, and yet, it would seem, very hard to learn. This is far from being the first time in the world's history that the tyranny of the Lords Brethren has proved less tolerable than the tyranny of the Lords Bishops.

DIVERSIONS OF FEELING IN GREAT BRITAIN AND IRELAND.

DUBLIN, January 10, 1897.

IT would be difficult to recall in political movements such another fiasco as that which has, since the autumn of 1890, befallen the British Liberal and Irish Home Rule parties—then triumphantly and enthusiastically marching together, under able leaders, apparently to a large majority and assured victory at the next election; now leaderless, dispirited and disorganized, with a majority of 150 against them securely seated for several years to come.

There must be causes for this apart from the fall of Mr. Parnell and the retirement of Mr. Gladstone. It has been due mainly, as far as Great Britain is concerned, to the unexpected development of sentiments that we must now recognize in the average British elector—the love of domination, the disinclination to relinquish in any degree his assumed right to interfere in the affairs of others, the desire to obtain and retain power at home and abroad wherever he believes that power will forward his interests and give greater scope for the exercise of British abilities. In Ireland it has been due mainly, among Protestants, to their fear of Catholic domination; among the ascendancy classes, to their desire to retain ascendancy; and, through religious and class sympathies, both have succeeded in permeating the British electorate with their opinions. Under the calm brought about by recent land legislation and the hopes of home rule, the Home-Rulers could no longer appeal to the sympathies of the same electorate by citing cases of cruel imprisonments and arbitrary evictions; and Ulster came with full effect to wave the bloody shirt concerning the "mightbes" under home rule. These, much more than Irish divisions, had most to do with breaking up the Liberal party. Irish divisions may fatally affect the progress of events in the future, but they furnished no real ground for the change. However otherwise separated, Irish Nationalists are united regarding main issues, and their divisions answer a prominent objection of the Protestant minority, that an unbreakable, overwhelming majority would always oppose them in an Irish parliament.

There are, however, other tendencies less apparent, that have strengthened what may be termed reactionary imperial feeling. Formerly those directly interested in government were drawn from a comparatively small class in the country. The civil and military services are now practically thrown open to all through open competition. There is scarcely a school without a boy or girl hoping to pass some examination and obtain Government employ. With the extension of the franchise and the spread and acceptance of trades-unions a new element has entered into politics—"labor." That far-reaching parliamentary resolution regarding all public work being executed at trades-union rates has subjected every imperial and local institution in the three kingdoms to the constant supervision of the labor party. It has become the direct interest of vast federations of workers that as much public money as possible should be spent, and it is only recently that they have realized the extent to which political power may advance their interests. We cannot affirm what the ultimate effect of these influences on old party lines may be. Here in Dublin the United Trades, formerly a Nationalist body, lately supported the candidacy of a Conservative Lord Mayor because it would

deprive a Home-Ruler of a second term, and involve the expenditure of some two thousand pounds in new liveries and carriages. The removal of bodies of troops, the shutting up of barracks in Irish towns, is now often objected to in Parliament by Home Rule members because of the loss of custom to their constituents. Extensive new barracks have lately been added to the ring of ten military posts encompassing Dublin. A National M.P. of the old type proposed to oppose the expenditure as unnecessary, and as illustrative of the stringency by which Ireland was being governed. He was warned on no account to oppose the interests of the trades in the expenditure, "with whom, before everything else, the principle of *airgead sios** weighs."

Every extension of imperial power, every increase of wealth, all centralization, tends to increase the size and importance of London. Including the county in which it stands, it already monopolizes one tenth of the parliamentary representation—as much as is enjoyed by Scotland. This large number, exercising an immediately environing influence, will be found increasingly an obstacle to wise decentralization. (Your capital, Washington, I believe, sends no representative to Congress.) A retrograde influence has been the number of civil and military servants returning on pension after comparatively short terms of service in India, saturated with contempt of popular principles of government. It is but of late years that the opening of the Indian service to free competition has begun to tell upon all classes of the community. Rapid communication and scientific weapons have made aggrandizement and the occupation of new territory increasingly easy, and the illustrated papers vividly bring home to the masses the glories and the progress of their empire. It is more difficult than formerly to reach the nation's heart and conscience on moral themes or questions of abstract justice. Under a franchise restricted to the middle classes, they alone had to be convinced. I feel satisfied, as I have before suggested in these columns, that it would be now more difficult than it was at the time to accomplish reforms such as negro emancipation and free trade. Added to all this, education and civilization have made such rapid advances, and free trade has brought such increased comfort to the masses of British workers, that, themselves satisfied with political privilege and influence, they are less inclined to consider the wants and wishes of others, especially when requiring some effort of the imagination to understand. Disappointment regarding Italy and France, and the extent to which political corruption prevails in the United States, have discouraged many from attempting wide reforms. "Since last I saw you I spent some years in New York, and followed the police inquiry of a few years ago," was the explanation given lately in my presence by one who has changed from home rule to conservatism.

So, for the present, public feeling slumbers regarding great issues. Here in Ireland, meanwhile, an old question made new—the overtaxation of the country—has come with a rush to the front, and we see, for the first time in the century, a demand unitedly made by all classes against England. The position is extremely interesting and remarkable. One Irish peer reminds the Government of the tea cast into Boston harbor. A deputy lieutenant of a county, one of the Edgeworths, declares it is "the paramount duty of every honest Irishman to protest, with all possible emphasis, against the unfair and cruel and cowardly system of extorted tribute under which our miserable country is bleeding to death." For the first time the Protestant and Catholic Archbishops of Dublin appear together on the same platform. It is satisfactory that, on any ground, this union should have come about. We have the principal Irish Home-Rule daily writing of the death of the editor of the principal Unionist daily: "In him the Irish press loses a brilliant journalist, and the cause of financial reform an invaluable advocate. His death at the present moment is a national loss. There was no stauncher friend of the financial cause than he."

The result is doubtful. Will nobility and gentry, in coöperating with Nationalists, acquire the love of leadership and finally lead the people towards some home rule settlement; or will the people be drawn away by them from their old national leaders, now at loggerheads among themselves, and from national aspirations to questions in which *airgead sios* more directly prevails? Even the British press is beginning to realize the importance of the movement, which is, of course, based upon the report of the Financial Relations Commission, of which you have been already informed. The Act of Union constituted Ireland, for the purposes of taxation, a separate country, to be separately considered, and dealt with apart (whether under a system of proportional contribution or contribution by equal taxes on the same articles in each country), "subject to such peculiar exemptions and abatements as the circumstances of Ireland might from time to time demand." The Commission was a strong one, largely composed of expert financiers selected from among all parties. Eleven of the thirteen, including The O'Conor Don (the chairman, a staunch Unionist) and Lords Farrer and Welby, reported:

"That Great Britain and Ireland must, for the purpose of this inquiry, be considered as separate entities. That the Act of Union imposed upon Ireland a burthen which, as events showed, she was unable to bear. That the increase of taxation laid upon Ireland between 1853 and 1860 was not justified by the then existing circumstances. That identity of rates of taxation does not necessarily involve equality of burthen. That while the actual tax revenue of Ireland is about one eleventh that of Great Britain, the relative taxable capacity of Ireland is very much smaller, and is not estimated by any of us as exceeding one twentieth."

Under this estimate Ireland is at present overtaxed to the extent of £2,750,000 per annum. When agitation ran high, the Unionists were loud in their declarations that they were prepared to grant anything in reason, short of home rule, generally desired by Irishmen. They have now an opportunity of proving their sincerity. Of all mean ways of evading the question, the proposal for a new commission of inquiry, now that one has decided against Government, would be the meanest. Fiscal questions are proverbially complicated. The present will give ample scope for discussion. The report of the commissioners, with their appendices and accompanying two volumes of evidence, are replete with interest, and will for years be standard works of reference relating to Irish finance.

There are many side issues. If articles of consumption were differently taxed in the two countries, customs barriers should be maintained. If an annual return of imperial taxes overlevied is to be made to Ireland for expenditure here, the demoralization incident to already bloated administrative charges might be increased. Those who believe the consumption of spirits to be an evil, cannot feel deep concern regarding increased taxation due largely to heavy duty on spirits which must diminish consumption, with the impossibility of illicit distillation in this country. Fifty years ago the tax on spirits in Ireland was 2s. 8d.; it is now 10s. 6d. per gallon. It is right to bear in mind that, even in the matter of spirits, the average Irishman consumes less than the average Briton. The following was the value per head of the consumption of dutiable articles in the two countries in 1892-93. Great Britain: Tobacco 12s. 11d., tea 10s. 1d., spirits 29s., beer 53s.; total £5 5s. Ireland: Tobacco 12s. 5d, tea 11s., 10d., spirits 26s. 6d., beer 27s. 2d.; total £3 17s. 11d. The reason the results of intemperance are so much more painfully apparent in Ireland than in Great Britain is, that the Irishman, though drinking less, really drinks a much larger proportion of his more limited income, and that he does not consume it so regularly or (if we might apply the expression) temperately, and, when he does drink, he drinks oftener to excess.

Much curious information is afforded, in tables of unquestioned accuracy, regarding the anomalies resulting from the present government of Ireland. Taking into account expenditure for imperial purposes, Ireland in 1829-30 afforded to the Empire a profit of £4,156,576; in 1893-94 only £1,966,094. In 1819-20 the civil government charges of Great Britain were 1s. 7d. per head of the population; in Ireland, 1s. 10d. In 1893-94 these had been increased to 11s. 5d. and 19s. 7d. respectively. The charge for civil pensions in Ireland is proportionately double what it is in Great Britain. In Belgium, a wealthy country, the civil administration costs but 10s. per head; the total salaries of the fifteen judges of the two courts of justice reach but £6,000 per annum. The Irish Lord Chancellor alone receives £8,000. The zest with which Conservatives are throwing themselves into the movement may be partly accounted for by the fact that many of the heavy increases of Irish taxation were made by Liberal administrations, and that if the Home Rule bill had passed, the present taxation, now declared ruinous, would have been riveted on the country.

I do not regard £3,000,000 more or less taxation raised mainly on luxuries (more or less injurious) as the greatest impediment to the prosperity of Ireland. The manly and womanly qualities of her people require to be drawn out by greater responsibility and greater power of initiative. D. B.

Airgead sios, Irish for "hard money."

TAINE'S PROVINCIAL NOTE-BOOKS.—II.

PARIS, January 13, 1897.

I LEFT Taine at Toulouse. He describes very graphically the city and its inhabitants, "diminutives of Italians." He is struck by the number of religious establishments in this provincial capital, and counts 77 such houses for a population of 100,000 inhabitants; among them three great colleges, each with 500 pupils. He had observed the same thing in Poitiers—38 religious houses for 35,000 inhabitants. "In Paris the colleges conducted by priests enter 80 young men every year at Saint-Cyr." This was written between 1863 and 1865. Taine was struck by the influence of the clergy; he speaks of the

great legacies made yearly to them in the province:

"We have no idea of this in Paris. We live in a small circle of learned and clever sceptics; we do not see the great public, *la grosse France*. We writers have a particular need to know these facts. What does a *provincial* merchant, functionary, nobleman, farmer, proprietor read? Almost nothing. They are outside of our life. Into this stagnant pond drops the ecclesiastical net. The old ladies, the fathers who have become conservatives, leave something to the clergy."

The want of cohesion among the classes excites Taine's astonishment. "Each society here keeps to itself. Many small noblemen, families with an income of ten to thirty thousand francs a year, spend three months in Toulouse with more or less luxury, and the rest of the time in the country for economy's sake. . . . Below them come the functionaries, then the bourgeois, the newly rich." This division of classes is perhaps more marked now than it ever was. General Trochu observes, in his interesting memoirs, that one of the consequences of a revolution is to divide the country into conquerors and conquered; France has had many revolutions, and each crisis creates new malcontents.

If there is a class which Taine had no opportunity of studying, it is that of the small noblemen of the province. They really form a nation in the nation; they have lost all their privileges except the privileges of vanity, which no government can take away from them, as these belong to the realm of imagination. Among our great writers, Balzac, in his 'Comédie Humaine,' has best described this class. Taine contents himself with noting, wherever he goes, their voluntary isolation. At Lyons, a professor tells him that "there is a small noble population, exclusive, insignifi cant, which spends its summer in its châteaux in the Beaujolais." At Besançon, he writes: "Exclusive nobility, terribly proud, even more than at Dijon, and allied to the clergy." At Poitiers, "The noblemen form a class of their own; when I was there a new Prefect invited all society, bourgeois and noblemen, to a ball. In a minute two camps were formed in the drawing-room, with a void between. A few bold young men alone established some communication. The Prefect did not repeat the experiment." "These nobles," he says, "have many children; no occupation, no office—it would be beneath them." "The old houses of the nobility are ugly and sombre, without any outside show; inside are majestic drawing-rooms, and the gardens are real parks. Add to this the thirty-eight closed convents, and you have an extraordinary city: small, tortuous streets, with old grass-grown pavements, at long intervals a lamp going out in the night, a perfect solitude at eight o'clock in the evening and often in the daytime."

These notes of Taine leave on the mind a rather painful impression, as if testifying everywhere to a certain absence of vitality. To be sure, they were written under the Empire, at a time when there was no political life or freedom of the press. Taine is constantly struck by the power of the Church, uniting its repressive action with the action of the Government and of the administration. "Perhaps," he says, "we still are the men of Gaul, with indestructible Druids, a chance Vercingetorix, and a hierarchical administration imported from Rome."

"In all fields of activity is felt the want of chiefs, of leaders. Almost all the men I see do nothing or work badly for want of guides. The men who have general ideas, the only directing ideas, are a small minority, one in a thousand. All these professors, these retired functionaries or archæologists, these officers whom I see, are idle, live in coffee-houses, sleep in their chairs, make collections. They have no compelling object."

Taine studies the life of the army officers with whom he associates during the examinations for the military school of Saint-Cyr; his observations on this point are interesting.

"The sub-lieutenant who assisted me during the examinations in gymnastics [fancy Taine giving marks in gymnastics !] absolutely would have me dine at the *pension* of the lieutenants and sub-lieutenants. . . . The fare was not bad; a long, narrow room, at the end of a lugubrious staircase, with one gas light. The young officers complain of the narrowness of their means, though they have a monthly supplement of thirty francs [this was at Lyons] Life is so dear here; impossible to go to a café to take the smallest pleasure, if you are not helped by your family. . . . The Government does what it can: the soldiers pay no toll on the bridges, they pay only half-price at the theatres, and quarter-price on the railways. . . . An officer remains generally six years in a grade, sometimes ten or twelve years in the grade of captain. . . . This involves much misery. Some are thirty-five, even thirty-eight years old, and are only lieutenants. . . . Some of these officers are fat and stiff: their mode of life does not develop fineness or elegance. They scream, have rough manners, become red; their pleasantries are not amiable. I have seen them twice, for a full hour, at the café. They kill time as well as they can, play cards, gaze blankly, read the papers a second time, talk of promotions, of permutations. None of them has the courage to work, to study for himself; very few go into society. They are bored. . . . The only consolation is the clean, well-fitting coat, the epaulette which gives them consideration. The state cannot do more—the war budget is already so heavy; and every man cannot be a colonel. One gets advancement at the expense of another. Here, also, you find the fundamental character of democracy: it is Darwin's struggle for existence."

This was written before the war of 1870, before the system of compulsory and universal service, which has greatly increased the French army. The principal traits are still like; the number of officers is much larger, and their advancement, in time of peace, is necessarily very slow.

I have already said that Taine, who was a professor in the University, counts wherever he goes the number of religious houses where education is obtained; not without a feeling of envy. At Poitiers, he finds everything crushed under the influence of the Bishop.

"Every year 300,000 persons visit the coffer of Saint Radegonde. When the saint's festival arrives in August, the pilgrims are so numerous and generally so poor that they sleep in a sort of camp outside of the town. I have seen the coffer; it is in a pretty church of the twelfth century, already much sunk in the ground. At every door in every neighboring street there are women who run after you and offer you small cheap medals and a quantity of candles. Near the church door old beggars ask for charity with a trembling voice. In twenty minutes I have seen a dozen people enter, men of the people, half bourgeois, all with one or several wax candles."

Taine is not indulgent toward the people he comes in contact with:

"A curious type," he says, "is the Proviseur [the head of a college], once a *maître d'études*, professor, censor, afterwards Proviseur—in short, twenty-five years here [at Poitiers]; himself a son of the land, having a wife of the land. He has recently been decorated because a pupil of his lycée won the prize in the competition of the departmental lycées. Face and manners of an old haberdasher, of a shrewd rag-merchant who has been polite to all his customers, who has gone regularly to mass and read the *Charivari;* bent on rising, but slowly, in the fashion of an ox; his sovereign pleasure to eat a melon with his family; doing little, patient, never recalcitrant; functionary at heart and from his birth, with a discreet smile and vague eyes; solidly wrapped in a good coat and solidly planted on large feet; the most mediocre of men—durable, flat, vulgar, and neat as a sidewalk."

The Notes abound in such small sketches—such instantaneous photographs. I speak only of what relates to the various classes in France, to the social condition of its population. I am not speaking of the hasty photographs of the landscapes, of the cities and regions which the author sees in his rapid journeys. Some of these descriptions have great beauty, as likewise the descriptions of the works of art, churches, tombs, or pictures, which Taine sees on his way, and which seem to console him for the meanness and mediocrity of men. He has a very vivid perception of things; he gives you, for instance, a very clear idea of the differences between the North and the South of France, differences which are felt in everything—in the atmosphere, in the landscape, in the character of the races.

"In the South you must live only with your senses, like a painter. You may enjoy the pretty face of a well dressed woman, a laughing visage under black hair, a powerful shadow under a long gray wall cutting the vivid azure, a delicious grape which melts like honey in the mouth; but you must suppress all inner feeling, all tender and profound dreams. A beggar here [at Montpellier] eats good grapes; a poor devil drinks pure, healthy wine, and no man gets drunk. . . . Such small elementary differences make great ultimate differences; the ideal is changed."

Taine feels very keenly the Latin character of the South, but he recognizes the Gaulish element mixed with the Latin element. "The want of moral and intellectual initiative, the spirit of administration and of submission, the love of order and of unity, the ideas of Bossuet, are Gaulish, and also Latin."

Taine's ideas are sometimes summed up in short sentences: "France is and will remain a democracy agitated by its writers and governed by its functionaries. The influence of the intelligent man is superficial and lasts but a lifetime, because there is a want of large and permanent estates." After having noted everywhere the influence of the Church, he says: "The power of religion here consists in the fact that it is an occupation, a regular mechanism which kills time, and the power of the clergy consists in the fact that it is a body of functionaries. You will find mysticism only in certain select and morbid souls." On the whole, the admirers of Taine will discern in these rapid sketches the elements of many of his generalizations; they will not regret having made with him these flying tours in various parts of France and in some of its great cities.

Notes.

G. P. PUTNAM'S SONS' spring announcements include 'The Literary History of the American Revolution, 1763–1783,' by Prof. Moses Coit Tyler, together with a new revised edition of his 'History of American Literature during the Colonial Period'; the final volume of the new and enlarged edition of the late Prof. Alexander Johnston's 'American Orations'; the second part of Prof. Charles M. Andrews's 'Historical Development of Modern Europe,' since the Congress of Vienna; 'Essays in French History,' by James Eugene

Farmer; 'The Literary Movement in France in the 19th Century,' from the French of Georges Pellissier by Anne Garrison Brinton; 'The Dungeons of Old Paris,' by Tighe Hopkins; 'Bertrand du Guesclin,' by Enoch Vine Stoddard; the sixth and concluding volume of Traill's 'History of Social Life in England' down to 1885; 'A History of Ancient Peoples,' by Prof. Willis Boughton of Ohio University; 'Life and Letters of Prof. Byron Caldwell Smith,' edited by D. O. Kellogg; 'Sketches Awheel in Fin-de Siècle Iberia,' by F. B. and W. H. Workman; 'The God Idea of the Ancients; or, Sex in Religion,' by Mrs. Eliza Burt Gamble; 'The Cross in Tradition, History and Art,' by the Rev. Wm. Wood Seymour, D.D., illustrated; 'Hypnotism and its Application to Practical Medicine,' from the Swedish of Dr. Otto G. Wetterstrand; 'Household Economics,' lectures by Helen Campbell; 'The Vines of Northeastern America,' by Charles S. Newhall; and 'Lawns and Gardens,' by N. Jönsson Rose.

Macmillan Co. have nearly ready Mrs. Annie Steel's novel of the great Indian Mutiny, 'On the Face of the Waters.'

Charles Scribner's Sons have in press the second and final volume of Prof. Charles F. Kent's 'History of the Hebrew People.' They will issue, in conjunction with John Murray, the unpublished works of the historian Gibbon, including seven autobiographies.

Dr. Elliott Coues has finished his labors on 'The Journals of Alexander Henry the Younger, and David Thompson,' fur-trader and geographer respectively, and the work will be shortly issued in a limited edition by Francis P. Harper. Thompson's maps will be reproduced. Unlike Dr. Coues's editions of Lewis and Clark and of Pike, the body of this publication consists of matter never before in print, and without a parallel.

Leach, Shewell & Sanborn announce an 'Introduction to American Literature,' by Prof. F. V. N. Painter of Roanoke College, and a 'Greek and Roman Mythology,' by Prof. Karl P. Harrington of the University of North Carolina.

'The Great Poets and their Theology,' by President Strong of Rochester Theological Seminary, will be published in the autumn by the American Baptist Publication Society, Philadelphia. It will make a large octavo.

'Common-Sense Christianity,' soon to be issued by the Congregational Publishing Society, Boston, will consist of the late Rev. Alonzo H. Quint's contributions to the *Congregationalist*.

Early in the spring will appear Mrs. Charles Fisk Beach, jr.'s, "study in sociology," 'Katherine Kent,' the scene of which shifts from New Orleans to London.

A monograph on the 'Causes of the Maryland Revolution of 1689,' by Mr. F. E. Sparks, completes the fourteenth series of the Johns Hopkins "University Studies in Historical and Political Science." As a chronicle of legislative and political events from 1658 to 1689, the work is useful, but it cannot be pronounced very satisfactory as a piece of exposition. The revolution of 1689 attacked the Palatinate system of government, which had never commended itself to the colonists, and which had incurred additional disfavor by the opposition of the Proprietor to William of Orange and his support of James II. But while this last was undoubtedly the immediate occasion of the revolution, its deeper causes lay in thirty years of grievances occasioned by the arbitrary interference of the Proprietor with elections and the proceedings of the Assembly, extraordinary nepotism, taxation, and harsh treatment of the opposition. Mr. Sparks shows, in passing, that complaints over taxation were the real cause of Fendall's rebellion, and that the act principally complained of—that of 1647, granting the Proprietor a duty on exported tobacco—could not have greatly affected the Puritans, since the latter did not enter Maryland until 1649. Bacon's rebellion, also, in 1676, had greater influence upon Maryland than has been generally supposed, and failed to become as formidable as in Virginia only because of lack of leadership.

M. Eugène d'Eichthal has just gathered together in a volume his articles on Alexis de Tocqueville which were published in the *Revue Politique et Parlementaire*. M. d'Eichthal translates, too, the very interesting conversations between Tocqueville and Nassau Senior, which will be new to his countrymen, and also gives some fragments of Tocqueville's correspondence. His domestic letters, running over a period of thirty-five years, have never been printed, though they are said to be both curious and valuable. They were, for the most part, addressed to his wife.

A new edition of Prof. Karl Krumbacher's 'Geschichte der Byzantinischen Litteratur von Justinian bis zum Ende des Oströmischen Kaiser-reiches (522 1453)' has just been issued by Beck in Munich. It is an octavo volume of more than 1,200 closely printed pages, having been expanded to more than double its original size. The chapter on Byzantine theology has been revised by Albert Ehrhard, Professor of Ecclesiastical History in Würzburg, and that on Byzantine history by H. Gelzer, Professor of History in Jena. The work is more comprehensive in its scope than its title indicates, since it treats exhaustively not only of Byzantine literature, but also of Byzantine art, antiquities, science (such as it was), and general culture and civilization. It has a very extended and valuable bibliography and an excellent index. The French Minister of Public Instruction has just conferred upon Prof. Krumbacher the "palmes d'or" of the Academy, and the Greek residents of Trieste have sent him 2,000 francs ($400) for the establishment of a seminar for mediæval and modern Greek in the University of Munich.

The first part of Dr. Gustav Krieger's 'Schwierigkeiten des Englischen' is entitled "Synonymik und Wortgebrauch" (Dresden and Leipzig: Koch). It contains a list of English synonyms or words having a similar signification, with passages illustrating their use and different shades of meaning. The arrangement is alphabetical.

The first volume of Robert Davidsohn's elaborate 'Geschichte von Florenz' (Berlin: Mittler) begins with the Etruscan period and extends to the thirteenth century. There is a plan of the city made in that century, and a good account of Florentine art and architecture, to which are added a list of authorities and a full index.

An ordinance recently issued by the Archbishop of Munich-Freising in Bavaria enjoins on the clergy of his diocese the necessity of cultivating and elevating Christian art. He calls attention to the lamentable fact that the Catholic Church, formerly the chief patroness of the fine arts, has now become the patroness of cheap colored lithographs and plaster casts manufactured by wholesale and utterly devoid of artistic value. Genuine works of painting and sculpture have been everywhere supplanted by these worthless wares, which ought to be banished from all places of worship and not accepted even as gifts. The clergy are therefore admonished not to permit any of these vile substitutes to be used for the adornment of the altars or walls or other parts of the sanctuary. Paintings and sculptures should be ordered, not through dealers, but directly from able artists, who, if required to sign their names to their productions, will be sufficiently careful of their reputation to do their best. This ordinance is a movement in the right direction, and will be approved by all lovers of sacred art.

Dr. Karl Vollers, who succeeded that remarkable scholar, Wilhelm Spitta, as the second director of the Khedivial Library at Cairo, has entered upon his duties as professor of Arabic in the University of Jena. His successor at Cairo is Dr. B. Moritz, for some time secretary of the Seminary for Oriental Languages at Berlin—a specially endowed annex of the university—and one of its lecturers on modern Arabic. Dr. Moritz not only is a classical Arabic scholar of ability, but has made himself surprisingly familiar with more than one of the living forms of Arabic speech, and as a competent investigator of the Mauritanian dialects stands almost alone. He assumed his present position two months ago, and already the spacious exhibition-rooms of the library, in the more systematic arrangement of the priceless African and Asiatic manuscripts they contain, prove the industry and capacity of the new director. The Government has lately decided to make liberal grants in order to complete the collection of Egyptological literature, and to give the library a foremost position as a storehouse of all that relates to the archæology, history, and linguistics of ancient Egypt.

A material representation of the extent and direction of mental activity in England is to be found in the classified list of books published in 1895 and 1896 in the *Publishers' Circular*. The sum total, 6,573, is almost the same as in 1895 (6,516); a considerable decrease in new works being made up by a corresponding increase of new editions. The number of theological works remains practically unchanged, but there has been a marked falling off of educational and medical works, voyages, and belles lettres, which have dropped from 442 to 153. On the other hand, poetical and dramatic works, and works on social and political economy, have largely increased; legal works have doubled, the arts and sciences quadrupled, while histories and biographies, 717 in number, have climbed from the fifth to the second place—fiction and juveniles of course standing first with 2,179 works. A comparison with a similar list of the literature of 1876 shows an increase of 1,685 books published, but an actual decrease in theology, political economy, voyages, medicine, and belles lettres. There has been a gain of 903 novels and children's stories, and the number of histories and biographies has more than doubled.

The testimonial to Mr. Cotton, late editor of the London *Academy*, amounted to £375. The committee intrusted with the raising of it consisted of four members, Prof. Robinson Ellis, Mr. F. C. Conybeare, Mrs. Marie Wharton, and Miss Toulmin Smith of Oxford; a notable conjunction of the sexes in such an enterprise. Twelve other ladies were among the contributors, who altogether were of a character and distinction to do honor to the recipient.

Crusoe's island has not disappeared, as reported, and the solitary himself continues to

come to the surface. Mr. Waters published Selkirk's last will and testament in the October number of the *New England Historical and Genealogical Register*, and in the current issue a London correspondent shows that Selkirk was much given to wills and powers of attorney in favor of his successive sweethearts —"in every port a wife." A tracing of his signature to one such document is reproduced. Mr. Waters's "Gleanings" in the same number show in transcripts of wills the English connections of Bourne, Hutchinson, Thorndike, Hayward, Newdigate, Foote, and other American families, and touch Shakspere once more in the will of his friend John a Combe, and Stratford in that of Richard Ange, in the John Harvard connection.

The article of most general interest in the *Geographical Journal* for January is Mr. H. Clifford's account of a recent journey in the unexplored eastern part of the Malay Peninsula. After a graphic picture of the march through forests so dense that even the heaviest beasts cannot penetrate them, but move, for the most part, along well-worn paths, he describes two native states visited—their methods of government and industries. Among these are manufactured "silks, cotton fabrics, native weapons, and metal and woodwork." They have a remarkable imitative genius. One man, for instance, "after paying a few visits to the engine-room of one of the local coasting-boats," constructed a steam-launch, the engine being "made chiefly of old kerosene cans." The method of government, till recently, was curiously similar to the feudal system of mediæval Europe, but is now a centralized system, the headmen of the villages being directly responsible to the sultans instead of to the great chiefs. The character of the government is illustrated by a description of a prison, the horrors of which can hardly be surpassed. Among the remaining contents of the number are a summary of the geographical results of researches in Karia, Mr. Sclater's account of the geography of mammals in the Nearctic Region, and "On the Distribution of Towns and Villages in England," in its physical aspects, by George G. Chisholm.

The larger part of the *Scottish Geographical Magazine* for January is taken up with "Observations on the Temperature of the Scottish Fresh-water Lochs," by Dr. John Murray. There are also interesting obituary notices of thirteen distinguished travellers and geographers who have died during the past year.

The Swedish specialist Dr. Widmark has published the results of an investigation into the prevalence of blindness in the Scandinavian countries (including Finland). They show remarkable divergencies. While the number of blind persons in Denmark is only 53 in 100,000, this rises to 83 in Sweden, to 128 in Norway, and to 155 in Finland. At the one extreme, Denmark is surpassed by only one European country, Holland, with 45; and at the other extreme, Finland only by Portugal and Russia, with 200. Compared with past years these figures show a decided improvement. In 1870 there were 70 cases of blindness to 100,000 inhabitants in Denmark, in 1870 in Norway there were 207, in 1864 in Finland the enormous number of 287. In Sweden there has been little general improvement during the past thirty years, but there is a decided improvement in the classes over sixty years of age. The highest proportion of blindness is found in the country districts; the proportion in the cities and the country districts of Norway, for example, being 83 and 145 respectively. This is largely the result of the better facilities for special treatment in the former. A similar difference is noted between the remote districts and those in the neighborhood of cities.

—Immediately after the death of Mr. Alfred Nobel, the inventor of dynamite, it was widely reported that the whole of his great fortune, accounted to be more than ten millions of dollars, had been bequeathed to the University of Stockholm. This proves to be not quite exact. The great legacy is invested so as to furnish an income which will provide for five annual prizes of sixty thousand dollars each. The first three will be awarded to the authors of the most important discoveries in physics, chemistry, and physiology. The fourth will be attributed to him who in the domain of letters shall have produced "l'œuvre la plus haute dans le sens idéal." (We quote from the *Débats*.) The fifth prize goes "à celui qui aura agi le plus ou le mieux pour la fraternité des peuples, pour la suppression ou la diminution des armées permanentes, et pour la constitution ou la propagation des congrès de la paix." These last two statements are not quite lucid. The prizes in physics and chemistry will be awarded by the Academy of Sciences of Sweden; the one for work in physiology or medicine by the Carolus Institute of Stockholm; the literary prize by the Swedish Academy, and the one for the furtherance of peace by a committee of five members chosen by the Norwegian Storthing. In accordance with the expressed will of M. Nobel, no consideration of nationality will be regarded in the attribution of these prizes; they are to go to the most worthy, "whether he be Scandinavian or not."

—In connection with the foregoing it is not inappropriate to advertise that the competition for the eleventh Bressa prize is now in progress (Jan. 1, 1895.–Dec. 31, 1898). The sum of 9,600 francs awaits the scientific author or inventor, without regard to nationality, who, in the judgment of the Royal Academy of Sciences of Turin, in the period above named, shall have "made the most important and useful discovery, or published the most valuable work on physical and experimental science, natural history, mathematics, chemistry, physiology, and pathology, as well as geology, history, geography, and statistics." Works submitted must be in print, and must be sent with a letter to the President of the Academy before the close of 1898. But the prize is not awarded merely upon competition. The Academy awards it "to the most worthy."

—Not very long ago, in No. 1616, the *Nation* reviewed the Arabic-English portion of Socrates Spiro's dictionary of the spoken language of Egypt. The English-Arabic volume of this important compilation goes to press during the present month, and, like the preceding part, will be issued from the printing office of *El Moqattam*, the leading Arabic daily of Cairo. Its publication is rendered possible by liberal subscriptions, made to supply the bureaux of the different Egyptian ministries with copies of a book of reference so greatly needed. Its value to foreigners having either official, commercial, or social relations with the people of Egypt will be incalculable, while philologically it will doubtless do something still further to supplement the known lists of New-Arabic vocables, numerous as were the additions made by the volume already published. That a lexicographical work of so perfect a character—which virtually has had no predecessor—should have been produced by a native scholar is a fact of no little interest. It is noticeable, too, that Mr. Spiro should have shown so intimate a knowledge of philological methods as to avail himself of the carefully elaborated system of transliteration employed by the late Spitta Bey—the only one ever applied to the Vulgar Arabic which is both simple and exact, to say nothing of the ease with which it can be written, or of its agreeable appearance in print. Before Dr. Spitta's day, and since, even European students who have treated the colloquial dialects of Egypt and Syria, have varied widely from each other in their transcription of the Arabic letters by means of a modified Latin alphabet, but have been alike notable for the unscientific inaccuracy of their methods. Folklorists will be glad to learn that Spiro Bey, after the completion of his lexicon, will give to the English-reading public several hitherto unrecorded Arabic popular tales, gathered from various provinces of Egypt.

—A report presented to the Board of Public Charities of Pennsylvania by Dr. Henry M. Wetherill contains a very interesting and gratifying account of the "Wisconsin System" of caring for the insane. Sixteen years ago the conditions prevailing in Wisconsin were similar to those now existing in Pennsylvania, and perhaps in most of our States. The State insane asylums were crowded with patients of all classes, acute and chronic, supported at a heavy expense; and of course the plight of the unfortunates who were remitted to the jails and poorhouses was deplorable. In 1881 the Legislature adopted a new policy, under which the counties have been encouraged to establish asylums of their own where the chronic insane who are able to work and not violent are cared for. According to Dr. Wetherill's report, this policy has been very successful. The State asylums have been relieved of inmates requiring comparatively little medical attendance, thus insuring better care for those most needing it, while the county establishments have furnished humane treatment in place of the brutalities and hardships of the jail and almshouse. These establishments are upon the "family plan"; the men carrying on the farms, which are a necessary feature, and doing practically all the heavy work required, while the women make and mend clothing, wash, and perform the domestic duties in general. A very great amount of freedom, under this system, can be permitted, and it has the inestimable advantage of retaining the afflicted near their relatives, who are of course chiefly of a class not able to spend their time and money in long journeys. In fact, the number of visitors is very large at these asylums, which is of itself a stimulus to good management. The entire expense for each inmate, exclusive of interest on the cost of buildings and farms, is only $1.65 per week; and the saving effected since the reform was instituted would, it seems, amount to more than the capital expended for land and construction. The Committee on Lunacy of the Pennsylvania Board of Charities are so thoroughly convinced of the wisdom of the "Wisconsin System" that they intend to introduce some of its features in Pennsylvania as soon as the necessary preparations can be made.

—Dr. Benjamin Howard, the English student of penology, has recently returned from a fourth visit to Russia and Siberia, where he

spent six months investigating the exile system. Besides inspecting all the exile prisons between St. Petersburg and Siberia, he travelled many hundreds of miles by rail, road, and river with convict gangs. His general impressions, as given in an interview reported in the London *Times*, seem to have been favorable enough to please even the Russians themselves. While censuring the general maladministration of the penal system, its "main principle" of productive labor is commended as worthy of imitation. The methods of self-support employed in Siberia are such, he assures us, that the convict does not lose all his self-respect, but is often fitted to become a more useful member of society than before. Dr. Howard declined to discuss the divergent statements of Mr. H. de Windt and Mr. George Kennan, contenting himself with the general remark that the administration of the exile system depends so largely upon individuals as to render almost anything possible. Of all that is bad in Siberia, however, he admits that Saghalien is the worst; but, although escape from this inhospitable island is practically impossible, Dr. Howard dwells upon the "well built and often pretty cottages," with "vestibules and gardens," in which the population of murderers and felons live, and the quiet and peaceful lives they lead on their farms. In this connection it is interesting to note that Mr. de Windt, in his recent book, 'The New Siberia,' is considerably more impartial than in his earlier work, though none the less do his admissions bear out the worst that has been said of the horrors of Saghalien. In regard to the "plet," he says: "Death sometimes follows this terrible punishment, which is only administered as a substitute for the death penalty." "Substitute for the death penalty" is, as the *Athenæum* remarks, a strange phrase for flogging to death.

—In a late number of *La Réforme Sociale* M. Gabriel Alix discusses the woman question with a great deal of intelligence and spirit. He regards the transformation in the condition of women which has been taking place all over the world during the last forty years—here more rapidly and there more slowly—as the most important social phenomenon of our time. The effect of it will be to enable women to render far greater services to society than they do now—"morally they are far better than we, that is certain"—at the same time that they can secure a much greater degree of happiness for themselves by reason of their less dependent, less precarious, and more dignified position. The movement is therefore legitimate and praiseworthy in the extreme. The writer points out that in its theoretical aspect the conclusion which we are approaching is by no means new—it was supported by Rabelais and by Montaigne, to mention no less important names; and in the middle of the seventeenth century, more than a hundred years before Condorcet and more than two hundred before Mill, a Protestant theologian, Poulain de la Barre, maintained, in a series of writings which had much success, that women were capable of all sorts of learning, and that they therefore deserved to be admitted to ecclesiastical, judicial, and even military honors. The sensible view which Erasmus took of the question may be seen in more than one of his 'Colloquies,' *e. g.*, "Puerpera" and "Abbatis et Eruditæ."

—A brief dispatch dated Mendoza, Argentina, January 17, and addressed to the London *Chronicle*, announces that the famous Swiss guide and Alpinist, Mattias Zurbriggen, the associate of Mr. (now Sir) William Conway in his remarkable tours among the high Himalayas, and at the present time the main reliance of the FitzGerald expedition to the Chilian and Argentine Andes, successfully reached the summit of Aconcagua on the 14th of the present month. This possibly makes a "record" in mountaineering, and the claim may be true that by this ascent the loftiest mountain of the Western Hemisphere has been conquered. Güssfeldt made an attempt on the mountain in 1883 and reached an elevation of 21,089 feet. Mental worry, seemingly, brought about through misunderstandings with his native guides or carriers, was the main cause which prevented him from attaining a much higher position. As to the position of Aconcagua in the series of highest summits of the Andes, some little uncertainty remains. According to the determinations of Captain Fitzroy, made during the famous cruise of the *Beagle*, the elevation of this extinct volcano is 23,910 feet, a value which is to be found in nearly all English publications. The Spanish engineer, Pissis, many years later, reduced this elevation to 22,422 feet, which again was advanced by Güssfeldt to 22,860 feet. It appears probable that the later measurements are more nearly correct than those of Fitzroy, and if this be proved to be so, then the "record" of mountaineering not improbably remains with Mr. Conway, through his conquest of Pioneer Peak (about 23,000 feet?), in the Karakoram Himalayas. As to Aconcagua being the highest summit of the New World, its place is more likely second or third. The Nevado de Sorata, or Illampu, on the Titicaca plateau, almost certainly surpasses it, and not impossibly by full 2,000 feet; and its neighbor Illimani has seemingly a just claim to be considered in the same comparison.

—M. Salomon Reinach has published in the *Monuments et Mémoires* of the Academy of Inscriptions and Belles Lettres a description, with accompanying plate, of a marble eagle belonging to Lord Wemyss and now at Gosford (Longniddry). Common as are Roman representations of eagles done in low or in high relief, whether in marble or metal, marble eagles done in the round are extremely rare, nor are there many such in bronze. Apart from the one now published, M. Reinach knows of eight, only three of which have any mentionable artistic merit. The eagle in Lord Wemyss's collection is of remarkably delicate and spirited workmanship, and must be from the hand of one of the earlier and most eminent of those sculptors to whom the revived art of the early Roman Empire is due. But the history of its transference from Rome to Strawberry Hill, whence it passed by purchase directly to Gosford, is interesting. Robert Walpole (Lord Orford), the successful minister of the house of Brunswick, had collected several ancient busts at Houghton Hall, when, in 1739, he sent his son Horace upon the "Grand Tour." This was what Michaelis has called "the golden age of classical dilettantism," and Horace Walpole was initiated in Italy by his father's protégé, Mr. (afterwards Sir) Horace Mann—possibly, like himself, a namesake of the elder Horace Walpole—and John Chute into the delights of classical sculpture, and through them made various purchases, one of which was this marble eagle. M. Reinach gives Walpole's own description of it: "The eagle found in the gardens of Boccapadugli, within the precinct of Caracalla's baths at Rome, in the year 1742. One of the finest pieces of Greek sculpture in the world, and reckoned superior to the one in the Villa Mattei. . . . The boldness and yet great finishing of this statue are incomparable, the eyes inimitable. Mr. Gray has drawn the flagging wing (Ode on the Power of Poetry). It stands on a handsome antique sepulchral altar, adorned with eagles too." The heliogravure by Dujardin which accompanies M. Reinach's memoir is needed in order to give point to Walpole's praises. With that before us, we sympathize with M Reinach's regret that the private collections of England should still be a *terra incognita* to the scientific archæologist. Michaelis has done much in his 'Ancient Marbles,' but he was unable to get sight of the Gosford eagle, which he believed to be at Lord Wemyss's London house. It is accordingly reassuring to know that a plan for the systematic publication of the treasures hidden in English private collections has recently been under consideration by the Society for the Promotion of Hellenic Studies.

SIR GEORGE TRESSADY AND OTHER FICTION.

Sir George Tressady. By Mrs. Humphry Ward. Macmillan Co.

Sentimental Tommy. By J. M. Barrie. Charles Scribner's Sons.

A Child of the Jago. By Arthur Morrison. Chicago: H. S. Stone & Co.

The Other House. By Henry James. Macmillan Co.

The Metropolitans. By Jeanie Drake. The Century Co.

The Violet. By Julia Magruder. Longmans, Green & Co.

Kate Carnegie. By Ian Maclaren. Dodd, Mead & Co.

Sister Jane. By Joel Chandler Harris. Boston: Houghton, Mifflin & Co.

Soldier Stories. By Rudyard Kipling. Macmillan Co.

If Mrs. Ward, in writing the story of 'Marcella,' meant to delineate a born revolutionist, one whom years cannot tame, her ideal is almost stultified by the story of 'Sir George Tressady'; if she meant nothing more than that Marcella Boyce was a revolutionist because she was young and discontented, then the spectacle of an active girl violently scratching molehills into mountains was not so serious or instructive as many people believed it to be.

It is distressing, however, to think that in the beginning Mrs. Ward meant Marcella to become, what she is after a few years of marriage with the excellent Aldous Raeburn, the perfectly respectable wife of a perfectly respectable peer, with a taint of eccentricity still lingering about her, but adversely criticised only by those whose respectability is not quite so ripe. Yet, if not deliberately planned, the change can have been effected only through the author's losing sight of her original motive, falling in love with the Maxwell splendor, and thus being diverted from the most probable development of Marcella's apparently ineradicable passion for the betterment of humanity. Whether it is inevitable that contemplation of the great aristocracy must induce in English writers a state of intellectual coma, one cannot say, but it certainly invokes a sort of superstitious reverence for traditions of dignity and race which is fatal to freedom and sincerity in art. Mrs. Ward struggles against impending fascina-

tion, but it is too strong for her and involves her in several misfortunes. The young Marcella cannot be annihilated all at once, so several impulsive indiscretions are permitted to Lady Maxwell; but the motive is no longer disinterested philanthropy—it is the success of the Maxwell bill, the victory of Lord Maxwell. Lady Maxwell does not turn her back on former interests and associates, but she is not any longer in the fight with the people, for the people; she uses the people, their suffering and wrongs, for the greater glory of the Maxwells. She bores high society conscientiously with talk about the sweating system and kindred iniquities; she lives intermittently in the East End, and drags thither men and women of fashion to study the poor at home; but the vision of perfection presented is not the vision of a spirit, impetuous yet resolute, dedicated to a forlorn hope—rather that of a noble lady clinging deferentially to a noble lord, roaming ancestral woods with a noble son and heir, condescending for political ends to exhibit her diamonds and extend her protecting sympathy to the struggling masses. Such is the solution of life's enigma offered to erratic and handsome young women—not, we believe, intentionally or even consciously, but because, when an English writer, socially of the middle class, who is not an artist or a genius, turns the eyes of the intelligence upward to the ruling class, they are smitten blind, and the solution comes as a beatific vision.

The failure of Marcella as a revolutionist is depressing, but the failure of Marcella as a great lady is in one important episode amusing. Her attitude toward Sir George Tressady is that of a good little bourgeoise, not of an acknowledged leader in a complex society. A great lady may have all the purity and high-mindedness ascribed to Lady Maxwell, but she is not an ingénue; she is well aware that one of the ways of the impressionable and idle men of her world is to fall in love with other men's wives, and is, therefore, particularly careful to avoid that complication. Lady Maxwell lavishes all sorts of attentions on Sir George, interests him in her affairs, interests herself in his, yet is prostrated with grief and shame when he tells her that his reason for deserting his leader, for betraying his cause, for finishing himself politically, was the old, old reason—passion for the woman who led him on.

If such a view of Lady Maxwell may be accepted as probable, it seems to involve the assumption that too much success had turned her head, and that conjugal affection had sapped her brain. Sir George's attitude, on the contrary, is entirely probable. Interest in him is almost restricted to the question, What is Lady Maxwell going to do with him and how will she do it? With the answer and the passing of the Maxwell bill, the story is told. To send him off on a domestic mission for the Maxwells (tendered either in token of forgiveness of offence or atonement for wrong done, no knowing which) is a comic anti-climax, and as clearly an expedient for spinning out the volume as is his melodramatic death one for ending it. Had he been driven to suicide by the follies and tempers of his vulgar wife and silly mother, added to the irritation of his tiresome tenants talking endlessly about themselves in dialect, there would have been something in him worth further record, something about him to remember beyond the fact that Lady Maxwell once took him up and, with all piety, purity, and propriety, ruined him.

The failure of characterization in 'Sir George Tressady' is not an accident to be lightly passed over and briefly set over against such qualities as information, careful composition, a feeling for good conduct, or even dramatic moments; it is essential, destroying the significance of two long novels, laying bare almost indecently a racial incapacity to cast off the shackles of materialism, to depict forcibly and consistently an intellect or spirit battling for an ideal, undaunted by adversity and unsullied by prosperity. It is one of those depressing failures which suggest even to optimism that English literature is taking a long rest on its laurels. However, when the English mind gets too stodgy to produce thoughts that burn in words that will not die, it may happen that literature is saved by the Irish, who always write good English, or by the Highland Scotch, who are not so particular.

Much of Mr. Barrie's contribution to the literature of fiction is good enough to keep the breath of life in a moribund tradition, to hold it over for fresh inspiration. It is strong enough to overcome the deliberate use of Scotch dialect and the unconscious lapses into Scotch forms of English. In 'Sentimental Tommy' he appears as one heralding the new dawn, for we can think of no tale in our language in which the author's mind is so exclusively given to the development of a temperament absorbed in itself, working itself out spontaneously, independent of authority, and apparently oblivious to the conventions of any class of society. The thing has been recognized by novelists of other nations as the great thing to do, and has been well done in Russian, French, and Italian. We are slow to get inspirations and accept revelations, but, on the other hand, once having "caught on," we are likely to speak louder and carry the tidings farther than if we were more alert and accessible to ideas. For this purpose of being heard afar and recognized as a new note, it could be wished that Tommy had been done all in English, that he had not sprung from Thrums or returned there; in fact that, externally and incidentally, the story were other than it is. Tommy, in his boyhood at least (which is as far as Mr. Barrie goes), is as independent of heredity and circumstance as a human being can be. His temperament is the artistic temperament, so wonderful and beautiful in its achievements, and so intolerable to live with unsupported by blind adoration. The temperament may be more common in one country than another, but it can sprout and blossom among the New Eng'and hills as well as on the boulevards of Paris, and its mark is sometimes supposed to be the mark of Cain. Mr. Barrie's exposition is masterly, not infrequently cruel—so cruel that one perceives the artistic temperament, with all its frankness and detachment from prejudice, even predilection, striking at itself and sparing not. Tommy is differentiated from other boys by the volume and energy of his imagination, by his emotional impressionability, and by his unscrupulous use of any means to gain an end, without pricks of conscience or fear of superior powers. His feeling of responsibility for Elspeth may indicate a phantasmal moral sense, but, if she should ever fail in sympathy with him, he could easily withdraw his protection. For a slight offence he threatened to make her live alone when she grew up, though he would sometimes come and speak up to her at the window. There are chances that, for a graver indiscretion, he would not come to speak, and might even neglect to pay the rent. There is no sort of certainty about Tommy, not even that he will always "find a wy," for the roads he must tread will surely be oftener dark and crooked than fair, and may as likely as not lead down to despair, with death the only open door.

Grizel is probably intended to be the savior of Tommy, if he can resolve himself to be saved. She is sure there is only one side to a question, her side; only one rigid right way, which she, at least, doesn't mean to miss. Her antecedents are disagreeable. The Painted Lady is a shocking sort of a mother to burden a girl with; and though the child's fierce loyalty is natural, her perfect understanding of the situation and attempts to manage it are too precocious, a little repulsive. The other children are Tommy's obedient and amusing slaves, more clearly defined than the grown-ups, an ill assorted, not very well-considered lot. But when we finish the book, we feel as if we had been looking at a planet through a telescope, indifferent to the quality of surrounding stars.

One of the earliest instances of Tommy's incalculable temperament is an exploit at a supper given by the "Society for the Somethink of Juvenile Criminals," in the East End of London. Here he permits himself to entertain a lady patroness by an imaginative recital of his horrid crimes. Later on, having a vision of Elspeth at home praying for him, he is overcome by shame, and interrupts the praying on the platform for the waifs present in the hall by a shrill entreaty to the Deity: "Oh, look down on them ones there, for oh, they are unworthy of thy mercy, and oh, the worst sinner is her Ladyship, her sitting there so brazen in the black frock with the yellow stripes, and the worse I said I were the better pleased were she." A similar entertainment is used to introduce "Dicky Perrot," in 'A Child of the Jago,' a story of a London slum, by Mr. Arthur Morrison. Dicky is of a lower social stratum than Tommy, bred in a filthy lair of hereditary outcasts and criminals. In the select gathering of "Elevators of the East End," Dicky makes his first "click," neatly cutting the fob of an eloquent bishop and making off with his watch. The story of the Jago is a terrible one, very modern in the manner of its telling, but dating back to Charles Dickens in matter, incident, and character. We seem to be reading about the "Artful Dodger" and "Poor Jo," "Tom All-Alones," "Bill Sykes," "Nancy," and "Peck-sniff" converted into a fence slightly more degraded, but no more hypocritical and hateful. They are all done in a new way—a harder, more physical, brutal way. We have a stronger realization of their pitiable plight, but are more reconciled to it—it is so hopeless, so inevitable. Our horror is more vivid, our compassion feebler. Undoubtedly a great impetus to philanthropy was given by Dickens's slum stories. He controlled tears and laughter; he made emotional people feel that something must be done, and he forced sentimental people to go and do something at once. It is hardly probable that any burst of sympathetic activity can follow the reading of tales written by the more actual moderns. Literary worth does not spur the general reader to action, and perhaps, with such tales as the 'Child of the Jago,' it is the force of the literary presentation which convinces those who can appreciate it of an impotence in action—a conviction to which that sort is ever predisposed.

The point made, and indisputably made, is that Dicky belonged to the Jago. Fate had

tumbled him into a noisome well, and not all the king's horses and all the king's men could avail to pull him out. Dicky was not naturally a vicious or even bad boy, but the Jago surrounded him with its murderers and thieves and the general atrocity of its record in the secret books of the police. Mr. Morrison describes the customs of the Jago with great vigor and apparent accuracy. He treats the street fights of the Rams and Learys as a feud, a Homeric episode, dropping into a style reminiscent of Fielding narrating the graveyard battle between Molly Seagrim and her hostile critics. Sal Green, like Molly, strips to the waist for the fray, and has an engaging, probably modern, trick of sitting on the downed antagonist and chewing the nape of her neck. The death of the chief character in a story may often be deemed fitting, but is seldom accepted with pleasure. Dicky's death is, in comparison with his life, a most cheerful episode, and there is a comforting sense of potential heroism given by his dying with a lie on his lips, "the staunch Jago lie—thou shalt not nark"—meaning thou shalt not tell who did it.

Mr. Morrison's criticism of collective philanthropic effort is severe, and his sketch of Father Sturt may be taken to mean that even though a man give his life for the Jago, yet shall it not be saved. His feelings are well under control, but he detests sentimentalists, and in reference to the hanging of Josh Perrot for the murder of Weech, a morally justifiable crime, he takes occasion to whack a certain variety of the too conspicuously tenderhearted, remarking:

"This was not a popular murder. Josh Perrot was not a man who had been bred to better things; he did not snivel and rant in the dock; and he had not butchered his wife or his child, or anybody with a claim on his gratitude or affection, so that nobody sympathized with him, or got up a petition for pardon, or wrote tearful letters to the newspapers. And the crowd that watched for the black flag was a small one, and most of it came from the Jago."

Being plunged in the atmosphere of crime from the first chapter of the Jago story, one settles down to it and escapes the shock of the painful unexpected; but how unprotected is the nervous system against the assault of the tragedy, including an ignoble and revolting crime, sprung on confiding admirers by Mr. Henry James as the climax of 'The Other House'! If the crime were entirely credible, Mr. James might never be forgiven; but it is fortunately only possible enough not to be impossible. Rose Arminger's personality is so complicated that it baffles prediction, yet the only way to accept her crime is to admit that a great passion recognizes no obstacle as final, and to take her own explanation: "It was all that I saw—all that was left me. It took hold of me, it possessed me; it was the last gleam of a chance." If 'The Other House' should be put on the stage (a destiny which probably awaits it), the climax would be the test of the drama's strength, and we should know whether Mr. James had made a brilliant deduction, or whether he had wantonly trifled with the nature of things. By dramatization 'The Other House' would lose little, for it is a play acted in Mrs. Beever's garden and Mr. Bream's house, and occupying only two summer afternoons with an interval of four years. Each act is but a critical moment, with only enough description and explanation to preserve the form of a narrative. The people come and go as on the stage, each one slipping away to make room for another who continues the action. The technical devices are so skilful that things appear to arrange themselves without direction or supervision. The past of the persons implicated, as well as the actual situation and the shadow of coming events, is revealed in dialogue—not the prosily explanatory or curtly informing dialogue of the average play, but light, neat, pointed talk. The mind of the speaker, whether it is quick or slow, ironical or literal, is disclosed through his speech. The stupidest of Mr. James's people express their personality in their talk, and that is what makes them more entertaining than some of the clever people we meet. Most of us live and die without hearing such apt, incisive, and witty talk as that of his clever people. His disinclination to occupy himself with the narration of exciting events has been so often commented on disparagingly that many worthy people, not unintelligent, refuse to read his books, because, they say, nothing ever happens. To such 'The Other House' is commended with entreaty, not only because their demand for happenings will be gratified, but also because, in hot pursuit of the catastrophe, they must be compelled to take in some of the beauty and skill of the approach; they may, indeed, even arrive at a dim consciousness of a fascination about certain roads that lead nowhere.

It is, perhaps, hard on the general novel-reader to find fault with him for insensibility to the rare quality of Mr. James's work, when even the general novel writer profits so little by the example of a master. Every art has its text-books, and though young novelists, rejoicing in the ownership of a robust genius, may scorn Mr. James's solicitude for degrees and shades and hints of things, they should control their feelings and study him for the sake of acquiring a method which is invaluable for the expression of any sort of a literary genius. Unhappily, every year respectable publishers issue novels the writers of which appear never to have heard of method or form or style, and who, besides, are quite devoid of common sense. The writers of 'The Metropolitans' and 'The Violet' are gloriously independent of authority, and free from the superstition that there is a right way to do a thing which one might try to discover before beginning. The perpetrators of these sad criticisms on aspirations to culture are named Jeanie Drake and Julia Magruder. They have innocent Christian names, and it is not pleasant to speak of them harshly, but they present themselves in great glory of print, binding, and illustration, and therefore court an attention which it would be ruder to deny. Miss Drake's conspicuous talent is for plagiarism (undoubtedly unconscious) of a generation of society novels and of the romantic view of a Bohemia peopled by phenomenal musicians, dancers, and journalists bounding up and down the ladder which has squalor at the foot and luxury at the top. Her original contribution is an arctic expedition with all the comforts of home, followed by a relief expedition, consisting of the hero's mother and fiancée, who come up with him at Newfoundland and lead him back in triumph to the wealth and station which are his temporarily alienated birthright. Miss Magruder's novel may be remembered by one taking notes on the manners of high society in America. It appears that though a girl may have an available grandmother, aunt, and guardian, she cannot "go out" or even stay at home properly without a hired chaperon. The chaperon appears to be an aristocratic appanage, an American equivalent for the ancient feudal retinue, or for the guard of honor which attends royalty. The story of 'The Violet' is that of a chaperon who refused to "go out," but spent the time accepting homage from her employers, and fascinating the guardian with her exquisite clothes and air of unhappy mystery. Mr. Gibson has provided drawings of Violet and her clothes which emphasize rather than extenuate the inanity and foolish pretentiousness of the text.

In a display of technical ignorance, "Ian Maclaren's" novel, 'Kate Carnegie,' is not far behind 'The Metropolitans' or 'Violet.' He sets out with a love tale; soon becomes involved in a theological controversy interspersed with anecdotes unintelligible south of the Clyde, about people and places with unpronounceable names; and returns to the love affair as a concession to the requirements of romance. This love affair is thin, dull, and conventional, and the worth of the rest can be estimated only by those learned in the Scotch tongue, and capable of appreciating the excitement of a Free Kirk Presbytery when "the minister of Kilbagie accused the minister of Drumtochty of teaching the Linlathan heresy of the Fatherhood of God in a sermon before the Sacrament."

The incidents narrated by Mr. Joel Chandler Harris in 'Sister Jane' are old fashioned, romantic, improbable, quite in the atmosphere of middle Georgia before the war. The manner is grave, repressed, a little stilted—qualities natural to a middle-aged bachelor, observant and reflective, and very much under the thumb of a bustling sister made up of a sharp tongue, a soft heart, and pronounced taste for management. Mr. Harris's quiet picture of an old-time Southern community is vivid and interesting, and seems to be true to fact. There is no violent contrast between the condition of the master and that of the slave, but an easy, harmonious assimilation, based on recognition of common humanity, without much reference to difference of color. Of course his representation does not cover the whole South, but only a section where the spirit of true democracy had not been contaminated; where, as he says, "the aristocracy of caste could hardly find a spot of ground on which to plant its dainty feet," and where integrity went farther than wealth. All his people own slaves, but are not therefore proud, splendid, and barbaric. The finest person socially, and the villain of the plot, is a colonel by courtesy, but his family is intimate with "Sister Jane," the tailoress, and exchanges "howdy" familiarly with all the village. The dialect used is similar to that which is pushed to incomprehensibility by Mr. Malcolm Johnston. Mr. Harris employs it with discretion as a medium for heightening color in funny old men (Grandsir Johnny Roach and Uncle Jimmy Cosby), for adding individuality to the irony of Mrs. Beshears and pathos to the distress of Mandy Satterlee.

The last chapters of 'Sister Jane' are somewhat tiresome and bewildering. There is too much strain on capacity for joy by the return of a long lost uncle and long-lost son, together with so much repenting and forgiving that the mind fails to distinguish between the sinner and the sinned against. We moderns resent such complications in life, and skip them in stories; but Mr. Harris, writing about simple Georgians of the forties, probably shared the primitive enthusiasm for strange coincidence and sentimental adjustments, and so fell into what would have pleased his characters, tak-

ing no thought for the duty of pleasing his readers.

The recently published volume, by Rudyard Kipling, entitled 'Soldier Stories,' contains nothing new, but the cream of the old. "The Man Who Was," "The Drums of the Fore and Aft," and "The Taking of Lungtungpen" cannot have too many editions as a practical recognition of both merit and popularity.

RECENT MUSICAL WORKS.

The Standard Opera-glass. By Charles Annesley. Lemcke & Buechner.

The Opera. By R. A. Streatfeild. Philadelphia: Lippincott.

How to Listen to Music. By Henry Edward Krehbiel. Scribners.

We are in the midst of the busiest and most varied opera season ever known in New York. First there was Col. Mapleson's Italian opera, then came the Metropolitan season of French, German, and Italian opera, which will be followed by Mr. Damrosch's German opera. Under these circumstances it may be assumed that the three books placed at the head of this review are timely publications. The first, indeed, is not a new-comer. It is in its eleventh edition, and, as it is revised and brought up to date, it may be considered the most satisfactory of the several books which attempt to tell the stories of the current operas. Mr. Annesley's list comprises no fewer than 119 operas, from which, however, those by Gramman, Kaskel, Kretschmar, Perfall, and some others might well have been omitted, as they have been sung only in Germany, and not often there. The omission of Massenet's operas is surprising, and many a purchaser will perhaps be indignant to find "Faust" missing; but he will learn that the plot has been placed under the head of "Marguerite," after the fashion of the Germans, who, to our confusion, use that title to distinguish Gounod's opera from Goethe's tragedy.

In Mr. Annesley's book the story of the opera is the main thing, although a few biographic and critical remarks are usually prefixed. In Mr. Streatfeild's book, on the other hand, while the plots of the most famous operas are also related, it is only incidentally; the main object of the book being to give a brief and clear account of the development of the opera from Peri and Monteverde, in the seventeenth century, to Wagner, Mascagni, and Humperdinck. There is also a chapter on opera in England, dealing with Balfe, Wallace, Benedict, Goring Thomas, Mackenzie, Stanford, Sullivan, and Cowen. That Mr. Streatfeild is quite up to date may be inferred from his including in this chapter a notice of Stanford's charming new Irish opera, "Shamus O'Brien," produced in London last year, and now running at the Broadway Theatre in New York. Nor does he say too much when he remarks that "Dr. Stanford's relation to the music of Ireland is here mainly what Weber's was to the Volkslied, and there is no inherent reason why 'Shamus O'Brien' should not be "the 'Freischütz' of a new school of British opera."

Mr. Streatfeild's book is entertaining throughout, and one of its best characteristics is its catholicity of taste. Reading the history of the opera, it is true, is a good deal like going through a cemetery reading the names of the dead on the tombstones. We have good literature thousands of years old, but the oldest operas ever sung now (Gluck's) are but little more than a century old; hence, although the opera was invented just three hundred years ago, all but eighteen pages of Streatfeild's book are properly devoted to the period beginning with and following the reforms of Gluck. It is rather odd, however, that so well-informed a critic as Mr. Fuller-Maitland should intimate, in an introduction to this book, that as music is the youngest art, so "the latest of the art-forms she herself has brought forth is unquestionably opera," when as a matter of fact it is one of the oldest in the shape used by Peri and Monteverde. He errs also in stating that Riemann's 'Opern-Handbuch' "does not descend to anything so frivolous as the narration of the stories." It does not always, it is true, but the plots of the more important operas are usually given. In other respects Mr. Fuller-Maitland's introduction is of interest; for example, he has a ready answer to those who say the opera is an unnatural art-form because in real life people do not talk in song:

"If it be conceded that the characters in a drama may be allowed to speak blank verse, it is hardly more than a step further to permit the action to be carried on by means of vocal utterance in music. . . . It is no more unnatural for the raptures of Wagner's lovers or the swan-song of ecstasy to be sung than for the young man whose character Tennyson assumes, to utter himself in measured verse, sometimes of a highly complex structure."

Mr. Krehbiel's book also has a chapter on the opera, but it does not go into details about special works and composers (except incidentally for illustration), but considers the opera as a general branch of music, and gives a bird's-eye view of it from every possible point of view—the singers, the orchestra, the libretto, the declamation and recitative, different forms (grand, comic, buffa, etc.), classical, romantic, and modern, Wagner's reforms, etc., with special remarks on Grisi, Jenny Lind, Lilli Lehmann, Sontag, Patti, Gerster, Lucca, Melba, Eames, Calvé, the De Reszkés, and others. Those who wail for the good old times in song will do well to ponder these remarks:

"For the development of dramatic ideals we must look to the singers of German affiliations or antecedents, Mmes. Materna, Lehmann, Sucher, and Nordica. As for the men of yesterday and to day, no lover, I am sure, of the real lyric drama would give the declamatory warmth and gracefulness of pose and action which mark the performances of M. Jean de Reszké for a hundred of the high notes of Mario (for one of which, we are told, he was wont to reserve his powers all evening), were they never so lovely. Neither does the fine, resonant, equable voice of Édouard de Reszké or the finished style of Plançon leave us with curious longings touching the voices and manners of Lablache and Formes. Other times, other manners, in music as in everything else."

The opera is only one of the forms of music described in Mr. Krehbiel's book. Other chapters are entitled "Recognition of Musical Elements" (melody, harmony, rhythm; motives, phrases, periods, etc.); "The Content and Kinds of Music," dealing chiefly with programme music; "The Modern Orchestra," describing the different groups and individual instruments, and their place in the organism, together with timely remarks on the rise of the modern interpreter in place of the old-fashioned time-beater; "At an Orchestral Concert," describing symphonies, overtures, concertos, etc.; "At a Piano Recital," telling about the classic and romantic writers for that instrument and the different forms used by them; "Choirs and Choral Music," etc.

The sub title of this book is "Hints and Suggestions to Untaught Lovers of the Art," and in accordance with this aim the treatise is written in a clear and untechnical style. The seams of the union of the topics are sometimes visible, but this, perhaps, was difficult to avoid, and does not affect the book's didactic value. The question of the relation of music to feeling is superficially treated, nor would a more detailed account have been in place in such a work. Mr. Krehbiel is at his best in academical discussions, as when (on pp. 137–9) he traces the evolution of the attempt to unite the different movements of the symphony through Beethoven, Berlioz, and Schumann to Dvorák, which is done with admirable insight and erudition. He also has some amusing remarks (10–12) on the errors made by literary men when they write about music. It is not likely, however, that they could be taught to avoid such errors by reading a dozen books on that art. The secret of the understanding and appreciation of good music lies in hearing it over and over again. Given the opportunity and willingness to do this, literary men may become musical enthusiasts and even discriminating judges of what is good, bad, or mediocre, though they may not be able, to save their lives, to tell the difference between a motive, a phrase, and a period. This is not said by way of condemnation of Mr. Krehbiel's book, the aim of which is excellent, and which contains information that every student of music ought to have.

Being a musical critic himself, Mr. Krehbiel naturally has a high opinion of the critic's office—although the dedication of his book indicates that he needed a colleague to help him "to respect musical criticism." He says he has been told that many people wait for their newspapers to help them make up their minds as to whether a certain performance gave them sufficient enjoyment. He says, further, that he conceives that "the first, if not the sole, office of the critic should be to guide public judgment." But it is a matter of history that if the public had followed the guidance of the critics, every musical genius that ever arose would have been nipped in the bud and crushed under foot. The musical critics who guided public judgment in the channel that time showed to be the right one can be counted on the fingers of one hand. In speaking of charlatans, the author remarks that "it is the critic who stands between him and the public he would victimize"; but he might more correctly have said that as a rule the critic stands between the man of genius and the public that wishes to adore him; Wagner and Liszt being conspicuous instances. Indeed, a book on 'How to Listen to Music' seems to be needed less by "untaught lovers of the art" than by the vast majority of musical critics.

WASHINGTON AND HIS LEGEND.

The True George Washington. By Paul Leicester Ford. Philadelphia: J. B. Lippincott Co. 1896. Pp. 318.

George Washington. By Woodrow Wilson. Harper & Bros. 1896.

It is, Mr. Ford tells us in his preface, the tendency of all nations to make their great men superhuman; and it is particularly remarkable how Americans should engage in the same practice of

"hero building which has given us Jupiter, Wotan, King Arthur, and others. . . . Indeed, with such characters as Washington, Franklin, and Lincoln, we have practically adopted the English maxim, 'The King can do no wrong.' In place of men,

limited by human limits and influenced by human passions, we have demi-gods, so stripped of all human characteristics as to make us question even whether they deserve much credit for their sacrifices and deeds. . . . If the present work succeeds in humanizing Washington and making him a man rather than an historical figure, its purpose will have been fulfilled."

The rest of the preface is mostly to the same purport, and the whole statement seems to involve some confusion. In the first place, the process of making Washington or Lincoln a thing "enskied and sainted" is not at all analogous to what has happened to any of Mr. Ford's typical "heroes." The Jupiter he has read about in Virgil was notoriously in Virgil's time a nature myth humanized; whether Odin—for, like Pisistratus Caxton's father, one prefers one's old favorites—is really a man or another nature myth, or both run together, is too doubtful to admit of using his name as a parallel; and while King Arthur may be—probably is—a real man elevated into a military saint and wonder-worker, he has not come down to us in a biography crowded with deeds perfectly attested, as well as attributes invented or exaggerated. The stainless Arthur of the "Idylls" is not offered by Tennyson as an historical personage. There is as yet no sign of such hero-building as would make Washington defeat Howe at Bunker Hill, or Franklin assist Joseph II. in his reforms, or Lincoln emancipate the serfs of Russia; yet of this sort are the myths which the Middle Ages flung round Alexander and Charlemagne. Whatever incidents may have been suppressed or invented in the lives of our heroes, belonged to their characters rather than to their exploits. In fact, Mr. Ford himself admits that the Autobiography of Franklin, with all its homely details, is still read with keen delight; yet no one who accepts that as an authentic record is likely to call its author faultless, filled as it is with his own "errata."

But the serious confusion in Mr. Ford's preface, expressing, as it undoubtedly does, a general feeling in our country to-day, is between ascribing to a man superhuman attainments and according to him merely an exceptional development of human qualities. Chastity, veracity, patience, and the like—in a word, self-control—are just as much human virtues as generosity, courage, and persistency. Indeed, the Greek conception of the virtues may almost all be reduced to self-control. No one has ever denied the perfect veracity of Epaminondas, the absolute continence of Scipio, or the never-failing serenity of Marlborough; those superlative virtues are neither more nor less historical because parts of the life of Epaminondas could not be spoken of to-day, because Scipio shielded his brother's corruption, or because Marlborough was a miser and a traitor. Why should we withhold credit from any number of human virtues, unless we find them coupled with some vices? Why is the traditional Washington any more mythical than Antoninus or Alfred? By all means let us have him as he was—a man; but do not let us insist in advance that a man is any less a man because he possesses in the highest degree the most distinctively human attribute, impossible to a beast and useless to a god, the power to check his faults and perfect his nature. Washington has been held up for generations as better than other men because the world found him so; because, in an age of detraction, his alleged faults disproved themselves. The world found him practising harmoniously virtues that were by no means superhuman, but which rarely met in such perfection in one man.

Such humanity, however, the present age says, it does not like. It is so much easier and more comfortable to mix up a few vices with one's virtues. They console one so admirably for the hard work of having any virtues at all that men are wont to say humanity means picturesque one-sidedness and healthy imperfection; and if any great man has been drawn free from those base qualities, why, the picture must be untrue; and so, why, he must have had them. In other words, history must be rewritten to suit a theory of human imperfection which shall turn all men, even the best and greatest, into an image not of a *Bon Dieu*, but of a *Bon Diable*. Men used to like a man better the nearer he was to the human ideal and the farther from human weakness; such goodness was encouraging to his weak, struggling brothers The new theory is that we do not want an ideal to encourage our efforts; we want a brother sinner to encourage our self-complacency. Surely a more conceited man than your Pharisee is he who says, "God, I thank thee that Franklin was a man such as I am."

Unfortunately, stern history will not be so dealt with—"The facts are ag'in' it." Mr. Ford, without writing a Life of Washington, has gone through his career, and, dividing it up into topics, and considering his subject in different relations, such as "Education," "Physique," "Social Tastes," and the like, has tried to show what Washington himself and his contemporaries tell us about him. The result is as the author himself sums it up in his preface: "It has only served to make Washington the greater to him." The closer we pry into his domestic life, the deeper, the tenderer, the more playful, yet the more self-sacrificing, appear his affections, especially as, under Mr. Ford's microscope, it is Mary and Martha who lose their traditional virtues and charm, and not the son and husband. The sharpest criticism of Washington's campaigns indicates that he was not the "Fabius" he was so often called, but rather a Marcellus, prone to attack, generally successful so far as his attacks received adequate support, but honestly diffident of his military skill, and deferring to the opinion of those he believed to have wider reading and experience in warfare, so as to be accused more than once of indecision. Yet in the end it appears that he understood the nature of the campaigns far better than his adversaries, and that such an army as we had owed its very existence almost wholly to his personal efforts.

The desired vices are, indeed, sadly lacking. A few more precious instances of profane language are recorded for the pleasure of his cavillers—one, in particular, resting on the evidence of Jefferson, at the time when Mr. Ford sees only too clearly that Jefferson's secret enmity to Washington was developing. By drawing into the service Washington's use of military stratagems and of one instance of reserve, he makes it not impossible that Washington did not invariably utter the truth, the whole truth, and nothing but the truth. He does show that Washington was susceptible to female attraction; but that he was so in any sense but a virtuous one depends, as Mr. Ford says with just indignation, on letters that are always cited and never produced—the sort of talk that is "bandied about in clubs" and belongs exactly there, and not on the pages of history. In a word, this book is a monument of industry, and shows beyond all question that while Americans need never hesitate to play with their Father's memory, as the children of his own time were used to do with himself, they need not fear that there is anything in the record which asks for concealment by pious sons.

Prof. Woodrow Wilson's 'George Washington' first appeared in the pages of a magazine, and is of a very different quality from Mr. Ford's work. It is to be judged as a literary essay rather than as a study of character, and the skilful use of well-known incidents, described in flowing periods, makes it suited for the reader who is to be amused or easily instructed in the main features of Washington's life. As such it would suffer under a critical analysis, for the material is not infrequently of doubtful origin, and the statements of fact are sometimes not beyond question. Who, for example, ever knew that George Washington was the uncle of Lund Washington? No genealogy, however experimental, has ever said this, but Mr. Wilson states it as a fact. In these pages we meet with the commonly accepted view of Washington. He is the model son, the splendid soldier, and the transcendent statesman. The sense of proportion is not well maintained, and too little attention is paid to his second term as President. If it was intended to give an account of the social forces and conditions that made Washington, the book is inadequate; and it is also inadequate as a description of the man. We are left in doubt whether Mr. Wilson began to write a history or a biography; and as he appears to have had both undertakings in his mind, it would be unjust to dwell upon the shortcomings of either. He has produced a very readable sketch, but it is not what was to have been looked for from his pen.

FEUDAL AND MODERN JAPAN.

Feudal and Modern Japan. By Arthur May Knapp. Boston: Joseph Knight Co. Two vols. 12mo, illustrated. 1896.

THE form of these two pretty volumes, clothed in white and gold, suggests the fine taste and rich culture of the author, who was resident for several years in Japan as a Unitarian missionary. In size they are 5½x4 inches and each an inch thick. Indeed, with scores of works on Japan upon our shelves, we do not know of any in which the dainty things and people and scenery in Japan have been more charmingly and successfully reproduced. Though unfortunately lacking an index, of which, to say the least, it is thoroughly worthy, the work contains a select bibliography, with brief but luminous notes such as only a critical reader could prepare. Of modern books of first grade of value and in English there are but few omissions.

The subjects chosen for discussion are such as the serious student of Japan will delight in reading about. Comparatively little is said concerning those external features of country and people in which the average shallow tourist revels. Mr. Knapp gets nearer the pulp and sap, if not to the roots, of this flowering century-plant among the nations. His themes are not of the géisha, nor of the silk shops, nor of the wrestlers, nor even of the theatre. He calls Japan the Robinson Crusoe of the nations, and then seeks to know some of the secrets of the continuing virility and progress of this former hermit nation. Why, instead of degenerating, are the Japanese able to-day to take their place and hold it among "civilized" nations? De-foe resorted to fiction to show how a castaway

sailor held his own, but progressive Japan is a fact. This is Mr. Knapp's engaging theme, and ably does he discuss it. His chapters deal with the spirit of unconquerable Japan, the people under feudalism, feudal commerce, the social outcast, the religious or patriotic cult of Shintō, and the invasions of religion from China, India, and Europe and their fate. In the companion volume the author treats of the colloquial and written language, of the temple and house, of those inversions and contradictions from which the Japanese no more than other peoples are free. The final chapter is on national unity. Mr. Knapp's reference to modern Japan is slender indeed as compared with his bright lights and deep perspectives of feudal, ancient, prehistoric and mysterious Japan.

That he writes as a lover, while professing to be a critic and evidently sincerely trying to be judicious, is manifest on every page. It is none the less true that in his general statements and in his references, direct or indirect, to his fellow-missionaries, he lacks not only accuracy, but charity. Furthermore, the vice of exaggeration seems to run through a large part of the author's description of Japan in feudal days. In his exuberant rhetoric, he is constantly asserting, with varied phraseology, that to this or that Japanese virtue, event, achievement, etc., etc., "the history of the world affords no parallel"; which seems to show either that the author is unfamiliar with the details of the world's history, including that of the actual old Japan, or that he is overcome by that glamour which so often deceives a judicial mind. He would have us believe that each Japanese village throughout the empire was an ideal democracy, with which the New England town system could not be compared with advantage. He seems to insist that in righteousness, justice, compassion, and the nobler virtues the rulers of Japan were, as a rule, superior to those of any other country in the world, and that the general condition of the people was that of marvellous happiness. In a word, he paints Japan as the natives do—as the land of the holy spirits.

It must be remembered that Mr. Knapp reached Japan about twenty years after the complete abolition of Japanese feudalism, and that his impressions of the past are derived, not from first view, but from a study of that strong Japanophile, the late Dr. Simmons, with whose kindly heart and judgment, as well as with his sorrows and alienation from his home land and friends, the writer of this review (who, by the way, actually lived under the Japanese feudal system and saw it in detail) was well acquainted. From our personal sight, knowledge, and critical study of feudalism in several provinces, we cannot accept Mr. Knapp's highly colored picture for reality. In the first place, Dr. Simmons's studies were confined, in the main, to those provinces under the direct control of the Tokugawa family. These were notoriously above the general condition of the hundreds of feudal fiefs. From personal acquaintance with Dr. Simmons's life and work, we know that this kind physician and noble student took the larger portion of his notes (which our American scholar, Prof. Wigmore, has digested with such valuable results) from old men and mature students. These men were almost passionate worshippers of the shōgunal old régime and of the customs and ideals of the feudal system in which they had been born. As heirs of the almost immemorial past, in which they had been reared until the new order of things rudely destroyed their world of ideas and left them broken down, disappointed, and poverty-stricken men, they could not but gild in their memories scenes which won a glory from being far away. Who does not know the old man and woman's reminiscences of the golden days of youth, and the proverb, "The former days were better than these"?

Mr. Knapp proceeds on the basis of two assumptions which, though popular, are not well founded: (1) that, for two centuries and a half, Japan was not only in "strict seclusion from all the world," enjoying no fertilizing or leavening contact with outside nations—a proposition which he sets forth with marvellous wealth of rhetoric and pertinacity (and almost pugnacity) of asseveration; (2) that the sole idea of the founders of the Tokugawa dynasty of Shōguns in Yedo (1604-1668), in ordering all seaworthy vessels to be destroyed and stopping all foreign commerce, was to isolate Japan and keep out foreign influences. As a matter of fact, Japan was never at any time impervious to foreign influence. She was not only subject to the osmose of the outside world, but she deliberately kept open at least one sluiceway. At Nagasaki, communication with China and her satellite nations and more or less with the rest of Asia was steadily maintained. The exchange of ideas and books, as well as of persons and commodities, was constant. Perhaps Japan never had in so small a compass a richer and more potent infusion than that of the refugee scholars who, on the fall of the Ming dynasty, entered from China and established themselves in Yedo and Mito, which Mr. Knapp aptly calls "the Boston of Japan." Still more significant is the fact that without a single annual intermittance, and often by semi-annual communication with Holland, there was a constant fertilizing stream of new ideas, of books and of learning from Europe, which kept the Japanese mass well leavened during the years from 1604 to 1868. There is no need of argument to prove these hard facts, which no one who is familiar either with the original Japanese records and the monographs of native scholars, or with the biographical works written during the last thirty years, which show the direct and vitalizing contact of the mind of Europe with that of Nippon through the Dutchmen at Nagasaki, would think of denying or even, without manifest polemic bias, attenuating. On the other hand, there is a vast library of Dutch documents in the archives of the Netherlands, and scores of printed books, which give proof of the constant fertilization of the Japanese intellect. This alien testimony is all the more valuable because the Dutch authors show scarcely a trace of boasting as to great results, whether or not foreseen or expected. In reality, there was nothing like a perfect intellectual blockade or "strict seclusion."

In the second place, the purpose of the "Japanese Government" deliberately to shut up the country from the nations, with the idea of keeping out all foreign influences, does not appear to the student of contemporary Japanese documents of the seventeenth century. Indeed, it is hard to see anything of the sort supposed by Mr. Knapp and so often imagined by foreigners and even by some Japanese. One thing does appear clear to the student, and that is that the double policy of inclusion and exclusion conceived and enforced by the Tokugawas, and by them only, had in view solely the political stability and continuance in power of the family of the Tokugawas. Accordingly, the elaborate feudal system of Japan, with duarchy of rulers, was reconstructed and rearranged, and the two capitals, Kioto and Yedo, surrounded by the most loyal vassals of the Shōgun. The "foreign policy of Japan" from the early seventeenth to the mid-nineteenth century was simply a party, clan, and personal affair.

It may be that the Japanese have all the qualities and potencies which Mr. Knapp so glowingly ascribes to them. Still, the scientific student, in order to form a cool judgment, must look at all the facts in the case, especially since Mr. Knapp insists that the virtues of the present are the direct and unchangeable outgrowths of the past. Making, as we believe he does, too broad generalizations from Mr. Wigmore's studies, turning bare facts often into epics and idyls, he gives wrong impressions of the past reality. Instead of the almost Edenic peace and calm and happy satisfaction of the peasantry with their rulers, the reader familiar with Japanese local history recalls, in many of the fiefs and provinces, chronic stories of bloody uprisings of cruel lords and gentry. The "pinching and searching economies" concerned the farmers and common people rather than the *samurai*, who lived without paying tolls or taxes. When, further, Mr. Knapp quotes his friend Fukuzawa—ever noble and illustrious name—and understands him to say (pp. 50 51) (even supposing a time limit of one man's life), that *only three* cases had been known in which "the hundred thousand samurai of his province had ever exercised the cruel privilege" of slaying without fear of punishment any inferiors who chanced to incur their anger, we wonder whether the author has any sense of humor. Indeed, there are not a few pages in this charming work where a keener sense of the funniness of exaggeration might have tempered our author's statements. When we remember that over one-twelfth of the population wore swords, paid no toll or taxes, and lived among unarmed inferior and more numerous classes of people who were political ciphers, having very few rights which the two-sworded man was bound to respect, even one who makes use of the same data accessible to Mr. Knapp cannot, Japanophile though he be, reach his conclusion. When to these data are added personal memories of popular local tales of murder, the actual sight of dead bodies lying in the streets cut down by the sword-wearers, and, above all, when one knows well the popular literature of Japan, he must necessarily picture a state of things quite different from what Mr. Knapp sets forth.

However, for the general reader who wants enjoyment, and would know the bright side of old Japan, these very fascinating volumes, gems of beauty and treasures of delight, form the best accessible introduction to the study of feudal Japan. Even those who think Mr. Knapp's pictures over-colored will thank author and publisher for this contribution to a study that increases in fascination as its depths are explored.

The Elder Pliny's Chapters on the History of Art. Translated by K. Jex-Blake; with an historical introduction and commentary by Eugénie Sellers, and additional notes contributed by H. L. Urlichs. Macmillan Co. 1896.

THE Elder Pliny is a writer with whom few scholars other than archæologists or grammarians have more than a bowing acquaintance. While the polite letters of that bland gentle-

man, his nephew, are regularly taken as an antidote to Juvenal, the laborious uncle is as regularly skipped. He is avoided partly for his form, partly for his matter. Pliny's Latin is too unclassical to figure among the "set books" of the Oxford schools, just classical enough to provide cases of over-development and back waters of syntax in an historical treatment of the same. A style that reflects the rhetoric of Seneca and foreshadows the epigrammatic brevity of Tacitus is, of course, eclipsed by comparison with either. Yet it has a claim on the historian of style, and when Quintilian admitted that the *contorta vis orationis*—the "contorted manner"—might have its uses for holding the attention, he may have been thinking of the learned involutions of the Elder Pliny.

The collection of literature always follows close on its decay. Pliny read more books than any other man of his age, and read them all with a view to the collection of literary curiosities. Literary reminiscences were the stock-in-trade of the profession of Sophist which was rapidly coming into fashion, and we are told that one of these showy declaimers offered upwards of $16,000 for Pliny's notebooks—that legacy to Pliny the nephew of 160 volumes from which the 'Historia Naturalis' had been compiled. So far, then, Pliny is the Roman counterpart of Athenæus, but here the parallel ends, for while the 'Deipnosophists' has been abridged to a mere thesaurus of quotations, Pliny wove his extracts into a text that, by its terseness, defied the epitomizers of the following centuries. His art history and art criticism were but a drop of water in the comprehensive ocean of his interests. What he had aimed at writing was an encyclopædia of the whole range of natural products, but there are episodes dealing with their application by human skill; the history of painters being a digression in the chapter on "kinds of earth and stones"—*terrae ipsius genera lapidumque.*

Without the slightest talent for observation, Pliny relied entirely upon books, but a defect that makes him irritating to the natural scientist is his chief credential as the historian of art and artists. Art criticism is the last thing we want from a Roman. To be æsthetic was not in the Roman blood, and æsthetic emotion was never anything more than a pose with the Grecomaniacs of the Empire. When one recalls Cicero's condescending excuses for the infatuation of those poor Greek beggars with the cold comfort of their art treasures, or the immortal contract of Mummius for the replacement, by facsimiles, of works of art lost at sea, one is not disposed to cavil at Pliny's plagiarisms. He frequently misinterprets his Greek originals, but Pliny's whole-souled blunders are not likely to mislead, and we can afford to touch lightly on the identification of Myron the Statuary with Myro, the girl friend of Erinna, or the differentiation of the Doryphoros of Polykleitos—the "common measure" of perfect man—from the "Canon." All Pliny's criticism and analysis of Greek works of art is Greek in origin, and his æsthetic appreciations are never his own; his chronological treatment is incomplete—for instance, he makes a bare allusion to the celebrated Pergamene school of art, and that not in its proper place; in many cases he speaks of works of art that had disappeared long before his generation as though they were still in Rome; in all his pages of art history there is, perhaps, only one instance where he speaks from observation. After half a century of tooth-and-nail criticism the Germans have left Pliny a tattered thing. But the borrowings from the Greek Xenocrates and Duris and Antigonos of Karystos and the Roman Varro that have been identified with tolerable certainty have nearly all their original value for the archæologist. The work of tracing Pliny's sources, begun by Otto Jahn in the middle of this century, has been carried on by Brieger, Brunn, Urlichs, and Furtwängler; and, only last year, Münzer, in the *Hermes*, detected Varro under Pliny, and sighted the Greek beyond Varro.

The most important feature of the present work is the historical introduction by Miss Sellers, which is a suggestive and scholarly survey of the efforts of the German critics to estimate the precise debt of Pliny to Varro and the Greek historians of art, and, where possible, to assign his own contribution to each one of these ultimate sources. Miss Sellers is also responsible for the excellent commentary. Here, as in the introduction, both from her own studies and from communication with German workers in the same field, she has been able to throw light on many disputed passages. We note, in passing, that her elaborate explanations of the word *scaena*, wherever it occurs in the Latin text, betray the disciple of Dörpfeld. The selections from Pliny here translated are practically the same as those published with notes by the elder Urlichs as part of his 'Chrestomathia Pliniana' (Berlin, 1857)—*i. e.*, those portions of the Thirty-third, Thirty-fourth, and Thirty-fifth Books of the 'Historia' that deal with silver-chasing, bronze statuary, painting, modelling, and sculpture in marble; and considerable use, with due acknowledgment, has been made of that excellent edition. The direct share of the younger Urlichs in the work is not important, and the notes bracketed as his are designed chiefly to point out alphabetical groupings which, now and then, help to settle a disputed reading.

The text is based on that of Detlefsen (1866-73), with, however, a closer adherence to the tenth-century Codex Bambergensis. There are other deviations from Detlefsen suggested by later criticism, and, in some cases, the earlier readings of Sillig (1855) or of Urlichs (1857) are retained, but the critical apparatus is slight. In xxxiv. 71, Miss Sellers's preference for the above Codex leads her to read *fecit, se impari, equis sine æmulo expressis*, which is inferior in sense and grammar to that of Detlefsen, *fecit, equis semper sine*, etc. In the same passage is offered the radical emendation *Alcman poeta* for the MS. *Alchimena;* the editor's objection to *Alcumena* (Urlichs, etc) is based on the expression *in hominum effigie*, which she considers inappropriate for a feminine subject; but this will hardly hold (*cf.* xxxv. 113, *nihil aliud quam homines pinxit*, where *homines* is rightly translated "figures," *i. e.*, men and women as opposed to animals, etc.). It is true that Pliny elsewhere writes *Alcmena*, but the archaic *Alcumena* is found in Cicero (*Nat. Deor.*, iii. 16) and is quite in place in an author deeply in debt to Varro. Miss Jex-Blake's translation is skilful throughout, and often very ingenious. On page 71 we fail to see why *violentia Neronis* should be rendered by the curious phrase, "Nero, by the strong hand. . . ."

The general effect of accurate scholarship in the book is marred by certain inconsistencies of notation. We take at random Lucian, *Dial. Meretr.* (p. 71), Lucian, The Liars (p. 62); Lucian "Ερωτες (p. 193); Maenads, mainades, and mainads all occur as the English forms; Vergil (p. 12), Virgil (p. 197); Cyrus and Kyros (p. 185); Crete (p. 185) and Krete (p. 223); whereas Miss Sellers regularly writes "indices," Miss Jex-Blake has the last word with "indexes." A word, too, about the spelling of the Greek names. Miss Sellers's rule is to transliterate, where possible, but she has not always had the courage of her convictions. Where one so drastic fears to tread we have no inclination to rush in, but alongside of Delphoi, Soloi, Ailian, Souidas, and Akademic we have the right to expect Loukian, Douris, and Skylla. There, however, Miss Sellers drew the line.

To the list of corrigenda we add the following: p. xiii, for "distinct to" read "distinct from"; p. xliv, for "Xenocratic" read "Xenokratic" as elsewhere; p. xlix, for "Demetrius" read "Demetrios" (*cf.* p. lvi); p. 35, for "Silanus" read "Salanus"; p. 47 for "p. 301" (in Pater's 'Greek Studies') read "p. 305"; p. 53, for "huntsman" read "huntsmen"; p. 74 for "Arrius and Pæta" read "Arria and Pætus;" p. 85, for "Hollwerda" read "Holwerda"; p. 144, for "contradiction" read "contradistinction"; p. 146, for "Moschos I." read "Moschos II."; p. 169, for "extinctæ" read "exstinctæ," as in text.

The book will appeal especially, we imagine, to candidates for Part II. (Archæology) of the Cambridge Classical Tripos; but for all students of archæology it will serve as a much needed handbook to those portions of Pliny that are indispensable to the study of Greek and Roman art history.

GERMAN SCIENTIFIC READING.

Edited by Professors H. C. G. BRANDT of Hamilton and W. C. DAYE of Swarthmore. With Vocabulary. 12mo, 269 pp., 85 cents *net*.

For those who have a fair start in grammar and can read ordinary easy prose.

Prof. A. H. PALMER *of Yale:* "I shall certainly use it with a class at the earliest opportunity. It seems to me considerably superior to anything of the sort heretofore available."

Prof. H. SCHOENFELD *of Columbian University:* "I have already introduced it in the Corcoran Scientific School."

Prof MARIE F KAPP *of Smith:* "All workers in science will be grateful to you for the reader."

Prof. HENRY COHN *of Northwestern University, Evanston, Ill.:* "I shall introduce it during the middle of the present term. I need say no more."

Prof. A. B. FAUST *of Wesleyan:* "I shall use the book in my sophomore German class (50-60)."

Prof. L. FOSSLER *of University of Nebraska:* "The selections are excellent, and varied enough to cover the most important scientific fields."

Prof A. H. PEPPER *of Union:* "I consider it much superior to anything I have seen in that line. I hope to use it."

Prof E B. DAVIS *of Rutgers:* "I hope to use it with a class this spring."

NEW YORK, THURSDAY, FEBRUARY 4, 1897.

The Week.

THE most encouraging event since the defeat of Bryanism three months ago is the selection of Lyman J. Gage of Chicago as the next Secretary of the Treasury. On the 3d of November the voters of the United States declared against the movement to depreciate the currency, and showed their readiness to support an administration which would grapple with the financial problem that has so long confronted the country. On the 28th of January the President-elect authorized the announcement that he had given charge of the Treasury Department to a man whose record and character show him to be admirably qualified for this great task. It is not an exaggeration to say that the choice of Mr. Gage as Secretary of the Treasury will give the business men of the country a sense of confidence in the future such as they have not felt for years. Mr. Gage has not only learned the trade of a banker, but has mastered the principles which underlie banking. We think it within bounds to say that there is not a man in the country engaged in the practical administration of financial affairs who has more thoroughly demonstrated his knowledge of the whole science of finance. A merely successful bank president is not all that the emergency demands. We need a man who understands the principles which experience has shown to be fundamental in the conduct, not simply of a particular bank, but of all great financial affairs. A prosperous business man is not seldom a man of narrow views and small knowledge outside of his own limited range of activity. He must possess a broad mastery of business generally in order to supervise intelligently the financial affairs of a nation. This is Mr. Gage's distinction among American bankers. It follows as a matter of course that the new Secretary is a thorough-going civil-service reformer. Mr. Gage was one of the chief agents in carrying through the movement by which two years ago Chicago applied the merit system to its municipal offices.

Mr. Gage's record as a civil-service reformer was all that was needed to assure the country how the next Secretary of the Treasury will stand on this question. Nevertheless, it is most gratifying to have this public announcement from the head of the most important department under the next Administration: "My appointments will be made with regard to merit, and not political obligation." The spoilsmen are as quick as the reformers to appreciate the significance of Mr. Gage's selection in respect to the spoils system. They had not, they tell us, expected it of McKinley. And yet in appointing such a man as Mr. Gage to the department which has most patronage, Mr. McKinley only does what he promised in his letter of acceptance, when he endorsed the pledge of the Republican national convention that the reform should be "extended wherever practicable," and declared that "the Republican party will seek to improve, but never degrade, the public service."

The silence that has come over some of our Republican contemporaries on the subject of greenback retirement since Mr. Gage's appointment as Secretary of the Treasury was announced, is quite remarkable. That Mr. Gage considers that step necessary to any real settlement of the currency question is shown by his written communication to the House banking committee. It does not follow that Congress will adopt this policy, which yet cannot fail to make great headway in public opinion and in party creed when such a man as Mr. Gage holds this position. If, as seems most probable, the Republican newspapers that have been heretofore praising the greenback as a precious ally in the civil war will contemplate it for a while in its more peaceful aspects, there will be a fine opportunity for rational discussion of this important matter—such discussion as Congressman Johnson of Indiana gave us in the House the other day. Of course the President-elect did not choose Mr. Gage without coming to a perfect understanding with him on this crucial question. What may be done to supply the place of the greenbacks when they are retired is a different question. It is one on which, very likely, Mr. Gage has not come to a definite conclusion; but there seems to be no doubt that the influence of the incoming Administration will be thrown in favor of the retirement of the greenbacks, and this is more than we expected three months or even three weeks ago.

The *Financial Chronicle* has a strong article on "The Nicaraguan Episode," in which attention is drawn to the fact pointed out by Senator Turpie, that the lands in Nicaragua and Costa Rica on which the Government's lien must rest have never been conveyed to the canal company. As the Minister of Nicaragua has officially notified Secretary Olney that the canal company's charter is forfeited, it results that, on the passage of the bill, the United States would come into possession of an empty shell. The first thing to be done would be to ask Nicaragua to furnish a right of way for the canal. Nicaragua would naturally ask why she should do that. Then Uncle Sam would say that he had bought a charter for a canal across the territory of Nicaragua and that he wanted to go to work. Then Nicaragua would very likely reply that not only was the charter in question forfeited for failure to do certain things within a certain time, but that it contained a clause providing for forfeiture in case the charter should be transferred to a government. Nicaragua might properly add that she had taken pains to notify Uncle S. of these conditions of the charter while he was negotiating with the sellers of it, and that some of his agents said that Nicaragua was trying to levy blackmail and that she was doing this at the instigation of Great Britain.

Now let us suppose that both of these charges were true, and were capable of proof; how are we going to build a canal across Nicaragua without a right of way? How are we going to take any step under a charter whose existence is denied by the Government of that country? We ask these questions because there is an evident disposition on the part of Senators Morgan, Aldrich, and other supporters of the bill to pass it still, or, as they say at Albany, to "jam it through." There is only one inference to be drawn from such headlong folly, and that is that they expect to buy a new charter from Nicaragua, or get the old one renewed, either with a part of the subsidy money or with money which can be raised on the strength of the subsidy, but outside of it. This is, perhaps, the blackmail that Morgan has so frequently referred to in his speeches. There is, however, not the least reason to expect the passage of the bill, which, even if it should be jammed through the Senate, would have to run the gauntlet of Speaker Reed's tomahawk and of President Cleveland's veto, both of which are doubtless held in reserve for it. As to the President-elect, it is safe to say that Senator Sherman represents his views on the subject. Mr. Sherman said in the debate last week that he was in favor of abandoning the present bill and taking up the subject *de novo*. It was this declaration that stirred up Aldrich to make the astounding declaration that the pending bill is "the only way by which the canal can be built."

Of all the rubbish talked about canals, the greatest is the rubbish which makes a canal outside its own territory useful to any nation in time of war. No nation expects to use a canal in time of war unless it holds both ends so securely that no fleet but its own can come near it. The Suez Canal is the only one in existence which ships of war can use at all, and

the treaty of neutralization forbids acts of hostility in the canal or within three miles of either end. This does no harm to any Power, and is distinctly in the interest of civilization. If a continental canal between two oceans or great seas were of great use to one of two belligerents, the other would have a strong motive for its destruction, for which an explosion of a lock or the sinking of a few cargoes of stone would be sufficient. No greater imposition has ever been attempted on the people of the United States than the notion that the Nicaragua Canal would be useful to us in time of war.

Having for once seen a high office seeking the man, the country must not complain if next day it is called upon to witness the surrender of another position in the Cabinet to a man who has been pursuing it with the utmost zeal in the most open manner. Gen. Alger of Michigan, who is to be Secretary of War, owes his prominence in politics to his wealth, which he has used more than once in a ridiculous attempt to capture the Republican nomination for the Presidency. Mr. Sherman put on record in his 'Recollections,' what was current gossip at the time, that "the friends of Gen. Alger tempted with money poor negroes to violate the instructions of their constituents" to support the Ohio Senator in the national convention of 1888. The Michigan politician has at last concluded to moderate his ambition, and, since the November election, has been working up a movement for his appointment to the Cabinet, which has at last been crowned with success.

Since Senator Sherman, sobered by the prospect of taking office, abandoned the Jingoes, they have turned on him savagely. A year ago, when he was leading the pack, he was, according to them, "the Nestor of American statesmen." It was no use to point out his blunders in fact and ignorance of law and treaty then; were you going to set yourself up against the "magnificent" old Senator? But now the Jingoes themselves are the ones to grieve over his mental decay, his forgetfulness, his absent-mindedness, his inability to understand an argument. They have known all this for years, they now sadly say, but have kept still about it. They certainly did last February, when they were lauding their Nestor Jingo to the skies. They see another alarming proof of his decline in his present opposition to the Nicaragua Canal bill. Over this they shake their heads pityingly. What, opposed to a bill which is an exposed fraud, though carrying $100,000,000 in guaranteed bonds? What Senator in full mental vigor could think of taking that ridiculous position? But Mr. Sherman will probably accept all this abuse philosophically as one of the incidental sweets of office. It may surprise him, however, though it should not, to learn that Jingoes, like republics, are ungrateful, and that there is such a thing as getting down in the dirt before them for nothing.

We fear it will be impossible for Senator Hoar to make clergymen and professors in Massachusetts afraid of saying boo to the Senate about the arbitration treaty. He is not able to terrify into silence even the people in Washington in full sight of his awful frown. A large meeting, representative of the first social and religious circles of the city, was held last week, almost within hearing distance of the Senate, to urge that the treaty be promptly ratified. It was called to order by an ex-Secretary of State, and vigorously addressed by an ex-Senator and a Justice of the Supreme Court. Judge Brewer's address was especially significant. He was President of the now happily deceased Venezuelan Commission, and is in a better position than most men to know what ugly possibilities were wrapped up in that controversy. Therefore, when he said that the United States had now a great opportunity to do something for the world's peace and progress, which, once lost, might never be regained, his words had more than ordinary judicial weight.

The Hawaiian cable scheme or schemes again occupied the attention of the House committee last week. Two rival companies are seeking a Government charter with incidental subsidy. Each, according to itself, is a pure and patriotic and wholly American organization; each, according to the other, is but a cat's-paw of England. What with preventing Nicaraguan canals from being built and covering the Pacific with a network of "military" submarine cables, British gold would appear to be having an unusually busy winter. What the poor Hawaiians want is, of course, altogether a secondary consideration. They exist only to be annexed and have cables landed on their territory. It may be worth saying, however, merely as a matter of curiosity, that they are heartily opposed to any such cable monopoly as is being urged at Washington. The Spalding concession, which will lapse in a month or two, the Hawaiian Government refused to extend or amplify when ex-Secretary Foster was sent to the islands in November to secure a new contract. A rather tempting bribe of $375,000 cash down was dangled before President Dole, but the Chief Justice told him he had no right to make an exclusive contract, the business and commercial interests of Honolulu pronounced strongly against the scheme, and Mr. Foster had to come away empty-handed. All this will, of course, be regarded as wholly irrelevant at Washington, where the process of voting away the lands and franchises of other nations is one of the chief occupations of some of our leading statesmen and lobbyists.

The acceptance by the House on Wednesday week of the conference report on the restricted-immigration bill doubtless insures its being made law, as the Senate has already passed practically the same measure. The majority for it in the House was small—131 to 117—but the principle of subjecting immigrants to an educational test of some kind has undoubtedly found great public favor, and may now be expected to remain a part of our public policy. The bill itself, as was pointed out in the debate, appears to threaten some hardships at first in the way of separating families, and it contains one huge absurdity—that of excepting immigrants from Cuba so long as the revolution is in existence. This sentimental clause might be taken as a reflection on the literacy of the Cuban patriots, but it is really no more so than the official Cuban statistics, which show that upwards of 70 per cent. of the population can neither read nor write. The restriction upon Canadian immigration is pure protectionism.

The Secretary of Agriculture has at last found an echo in Congress. His repeated and vigorous attacks on the free-seed fraud have finally roused some members to join him in denouncing it. Not enough have yet been found to strike it out of the bill, though a respectable minority, including Speaker Reed, voted on Saturday to make an end of this particular form of wanton waste. Secretary Morton has been about the only man of prominence in the whole country to take a practical stand for economy in national expenditure. Others have burst into beautiful panegyrics on economy; he has economized. During his term of office he has covered back into the Treasury about $2,000,000 of the money voted him. He found it unnecessary, and therefore did not spend it. What is the result? He is the most unpopular man in Washington. He has told the truth and has saved money. That is enough to damn him in the eyes of a humbugging and spendthrift Congress. His practical, as distinct from their theoretical, love of economy has lashed Congressmen into a noble fury. He ought to be impeached, they have cried. They have devised the most stringent laws they could in order to force him to squander the public money. Not waste the public funds when Congress ordered it? The impudent fellow! They would show him who was master, and would throw the people's money into the sea for all of him. Then they put forward Mr. Dingley to shake his head gravely and to say that Congress is really a most economical body. The proof? Why, it hasn't voted a dollar that somebody has not asked it to.

We are very glad to get from Mr. Hanna a full explanation about the new tariff. He tells an interested and, we hope, a trusting public what the "programme" is. It includes the following items: extra session, March 15; bill to be passed in sixty days, "an understanding" having been reached with the "doubtful" (*i. e.*, the silver) Senators; the bill to go into force on July 1; from that instant the American people to enjoy unbounded prosperity. The bill, moreover, is to be simply perfect. It is going to keep out foreign goods, yet increase the revenues. It is going to satisfy both moderates and extremists. No prosperity is to come till it goes into effect, Mr. Hanna says, but he is firmly resolved on an "era of national blessings," to begin the day after. All this is most auspicious. A prohibitive tariff for revenue only, without a particle of jobbery or favoritism in it, based on an "understanding" with the silver Senators, will leave the pessimists in a sorry plight.

What means of information the Rev. Mr. Crosser of Glens Falls, N. Y., may possess, we do not know, but at the Platt dinner he announced that Platt's operations as a blackmailer and briber were sanctioned and even contrived by the Almighty, and that when Platt asks an insurance company or a gas company for a few thousands, he acts as a divine messenger. This, at least, is the construction we put on his thanking God for Platt's "great leadership." The levying of blackmail on the corporations and distribution of the money among the members of the Legislature is the only Platt "leadership" we know of. We have often heard of and have known of irreverence, but this making God a member and promoter of Platt's machine surpasses the Rev. Mr. Couden's petition in Congress that we might be made "quick to resent insults." But Mr. Crosser went further than this. He prayed God to spread Platt's system through the country, and suggested that this was the best thing the Creator could do for the American people. If Platt does not do something for Mr. Crosser, he will be stricken with disease in all his joints. A great rascal who does not "recognize" a clergyman who prays for him is unfit for human society.

The bill authorizing Mr. Olcott to conduct the competitive examinations for his own office, which has been framed by the Gruber Progressives for the purpose of evading the constitutional amendment, was originally introduced as an amendment to the consolidation act. This would, under the Constitution of this State, have compelled its submission to the Mayor for approval or disapproval, but the Progressives did not discover this at once. Were they good citizens, anxious to execute the law in spirit and in letter, they would have been glad of this submission, as insuring more thorough examination for their bill as regards its utility and adaptation to municipal needs. But when they found that this would be necessary, they were stricken with consternation. Submitting bills to the Mayor was the last thing they thought of. So they brought in a new and separate bill in order to avoid it, and they make no concealment of the reason. Their object, both in the substance and form of the bill, is to defeat the Constitution. It is to this increasing boldness we wish to call attention. It is another step in our downward course. But we have abiding confidence in the courts, which are really the only restraint on the machine of both parties, for in measures of this sort both machines work together, and it is for their advantage to do so. Another sign of the times is the sort of statesmen who are now daily coming to the front. Gruber, for instance, occupied, until recently, the same kind of place as the late Capt. Cregan—that of a district leader, seldom heard of except in the exposure of some "game" there practised. But Gruber now makes speeches, founds societies, drafts bills, and is consulted by members of the Legislature. One of the latest bits of news from Albany, that he and Lexow have "put their heads together," comic as it is, has its significance. Think of such a combination of heads having influence on public affairs!

There are many signs that the political upheaval from which South Carolina has suffered so sadly during the last half-dozen years is subsiding, and that the unfortunate State is now to have a period of comparative peace. The new Governor is evidently a far more conservative man than either Tillman or Tillman's immediate successor in that office, and newspapers which have opposed the new régime all along, speak very highly of the way in which Gov. Ellerbe's administration starts off. Judge Earle, the new Senator, is the greatest possible contrast to Tillman, whose colleague he will be for the next four years at Washington. The Charleston *News and Courier*, which has been the bitterest opponent of Tillman, says that Earle is "an honest man and a strong man," that "he represents in a marked degree the conservative sentiment of the State," and that it expects him to "make a Senator in whose official course the whole State can take a just pride." The whole country has been discredited by Tillmanism in South Carolina, especially since its spokesman reached the United States Senate, and it will be a national relief to have the nuisance abated.

The parliamentary papers on Turkish affairs, which were made public on January 21, show that Lord Salisbury has won, as the *Daily News* concedes, "a diplomatic success of the first order." He has, in other words, at last got his concert of Europe to coerce the Sultan if necessary. At last accounts, the concert of Europe had appeared to be, as Lord Rosebery expressed it, a concert against Great Britain more than against the Turk. The situation now is that England, Austria, and Italy are absolutely agreed on coercive measures, that Germany will agree if the rest do, while France and Russia have consented, to use the words of the last Russian dispatch, "not to object to advise as to coercive measures if the Sultan should refuse to accept the reforms." This was the sticking-point of the whole negotiation. It had seemed impossible to induce Russia to employ force in Turkey. So late as November 4 M. Shiskin informed Mr. Goschen that it would be "extremely repugnant" to the Czar to contemplate coercing the Sultan. Again, on November 18, the Czar said that coercion would be "impossible." Yet by the end of December the Russian Minister wrote that he was authorized to say that "the Russian Government agreed to the proposals" which Lord Salisbury had made, and that it would resort to force if necessary. Russia's attitude of course determined that of France, and a month later M. Hanotaux assented to Lord Salisbury's proposals in almost exactly the terms of the Russian acceptance.

What wrought this great change in the Russian policy does not clearly appear. It may have been partly Lord Salisbury's public recantation, in his Guildhall speech, of his old and bitter Russophobia. He then declared that English dread of Russian diplomacy in the Orient was "an antiquated superstition." As the Earl of Kimberley pointed out in the debate on the Queen's speech, no man had done more to inflame that superstition than Lord Salisbury himself. He quoted largely from the Prime Minister's speeches of twenty years ago, in which the intrigues and ambitions of Russia were painted in the blackest colors. Salisbury met these citations in his finest vein of cynicism. No man not more enamoured of his own eloquence than he was could be expected to remember what he had said twenty years before. He believed Lord Kimberley's quotations were exact, but what did they signify? One could learn many things in twenty years. This recantation, we say, may have helped incline the Russian heart to be gracious, but it was probably the terrible shock of the Constantinople massacres which made the Russian Government see that it could no longer afford to stand between outraged Europe, outraged civilization, and the Great Assassin. The dispatches now published leave the complicity of the Sultan in those massacres unquestionable. The slaughter was done with his full knowledge and consent, if not at his direct instigation.

THE ARBITRATION TREATY IN THE SENATE.

It is impossible to comment with any confidence on the arbitration treaty until it leaves the committee. Nor is there much use in predicting what its fate will be in the Senate. We can only say now that one amendment which the committee has adopted, as reported from Washington, would, should it be retained by the Senate, make the treaty a mere form, and apparently a useless one. It is said to run as follows:

> "No question which affects the foreign or domestic policy of either of the high contracting parties, or the relations of either with any other State or Power by treaty or otherwise, shall be subject to arbitration under this treaty, except by a special agreement."

Of course this would simply be an agreement to arbitrate in any quarrel if we like, or, in other words, would put us in the exact position in which we stood before the San Juan arbitration, and before the *Alabama* arbitration and the Bering Sea arbitration. No nation can be deprived of its right to arbitrate by "special agreement," which is what we did in all the above cases. What the proposed arbitration treaty does is, in the first place, to create machinery of arbitration to be ready when the occasion calls for it, and to make it morally obligatory on the signatory Powers to *try* to arbitrate before resorting to war. This is all that it does. It does not take away the opportunity of fighting, if the nation wishes to do so, as Gen. Hawley seemed to suppose. It was this supposition which made his after-dinner outburst so ludicrous. No treaty could do this. We could refuse to arbitrate when the first difficulty occurred and thus break the treaty. All that would happen to us in consequence of this would be that some one would say—"Ha, you have broken a treaty; you are a pugnacious people." But we could reply to this by simply killing a great many people and destroying a large amount of property. The notion that the treaty is anything but a moral commitment, or imposes on us anything but a moral obligation, or has any sanction except love of civilization and moral shame, is one of the humors of the occasion. Senator Hawley's objection that it contained no provision against "grabbing" on the part of England, was one of those childlike observations in which members of the Senate occasionally indulge. The treaty deprives neither party of a single power or right. It simply appeals to their moral sense, and asks them, when in a passion, to wait a few weeks and see whether the quarrel cannot be settled peacefully. It tries to reverse the old presumption that when a great nation feels wronged it must fight. It says, "No, it need not fight; there is a better way."

The notion that it may do something to the "Monroe Doctrine" is equally delusive. The theory of the President and of Mr. Olney and many others, including the whole House and Senate, was that the conduct of Great Britain in Venezuela was a violation of the Monroe Doctrine. It was this theory which made Congress "stand behind Cleveland" instantaneously, with no knowledge of the cause or nature of the dispute. But see what came of waiting a while, and not "fighting from the word go," as the semi-barbarian frontiersman says. The committee appointed to draw a line for us to fight Great Britain on, looked at some maps and archives, but never reported. Arrangements were made for the settlement of the whole controversy by evidence and argument and legal principles—in other words, by judges and counsel. No one had his bowels let out or his head smashed. No towns were burnt or bombarded. No widows or orphans were added by man's savagery to the sad list which nature yearly makes up. There are no "hells of destruction" at sea to ruin commerce and convert lieutenants into captains, and the "Monroe Doctrine" seems still to be as good as ever.

This doctrine is evidently still a thing to discuss, not to fight about. It is almost impossible to fight about anything which has never been clearly defined. Somebody ought to describe it in set terms. Until this is done, it can never be received into the body of international law. At present it is simply a wish or aspiration of the American people, and something that Senator Lodge knows about, but does not tell. But it is impossible to ask the nations not to violate it, until they know exactly what it is. Its present rather vague form is that no European nation must appropriate additional territory on the American continent, even as indemnity lawfully won in war, yet that any American state may go to war if it pleases, but, if it seeks to arbitrate, must get permission from the United States. Secretary Olney says that the will of the United States is law over this continent. But no American nation except the United States has ever agreed to this. Several totally deny it. Moreover—and this is very important—the United States has never announced that it will be responsible for its American protégés, and none of them has ever claimed its protection as lord paramount, though several have asked for it as from a big brother. As long as this confusion lasts, the Monroe Doctrine is likely, in the eyes of foreigners, to remain very much in the condition of a counsel of perfection or a modern church creed—a good thing to argue about, but an impossible thing to live by.

THE BIMETALLIC REACTION.

The bimetallic speeches in the Senate of Messrs. Hoar, Chandler, and Allison are a scandalous, almost a criminal, violation of political good faith. If they had dared to make such speeches in the course of the campaign, Bryan would have been elected. If what they say and aim at is true and desirable, Bryan should have been elected. That Senator Hoar is a Bryanite on the money issue he himself confessed in his garrulous, senile way when he said that all who voted for Bryan thought, of course, just as he did about bimetallism. To point to the international-conference clause of the Republican platform is beside the mark. That clause was swept overboard in the very first rush of the free-silver storm. It played no part in the canvass except to serve as the butt of Bryan's ridicule. Bimetallism of all sorts dropped completely out of sight in the Republican arguments, and if there was ever anything to which any party stood solemnly pledged and bound, it is the maintenance of the gold standard, without alteration or addition, by the Republican party. On that issue the entire battle was fought, contributions asked, sound-money coöperation from all sides invited, the business world appealed to. The gold standard, unchanged and undiluted, was what the Republican party said it was for, what the majority voted it into power to defend and perpetuate. The spectacle, therefore, of Republican Senators leaping again into the free-silver slough as if nothing had happened since they were last in it, is one, not only of unprecedented folly, but of unparalleled baseness. It is a shameless betrayal of political trust. What are the sound-money Republicans of the House going to do about it? What has Speaker Reed to say? Will they join Senator Hoar in confessing that they were cheats and hypocrites all through the canvass, and that they really believed in Bryan's principles, though voting and speaking for McKinley?

Mr. Hoar's performance on Friday exemplified anew the reason why that body has declined in popular estimation. There are few gentlemen in that body who have less comprehension of currency questions than Mr. Hoar. His utterances on such subjects have generally been such as are not to be described in polite terms. He went to Europe last summer without any language but his own, and came back towards the end of the campaign, when we were fighting for our lives against both silverism and bimetallism, and gave out a Bryanite interview showing that the bimetallists were right and that their triumph was near. He has now publicly produced in the Senate his European budget, and announced that "the great majority of the civilized world are in favor of the double standard of gold and silver." His authorities for this assertion are (1) a resolution introduced in the French Assembly by a leading bimetallist last spring (that is, a year ago) pledging France to coöperate with other nations in the restoration of silver—a resolution which meant absolutely nothing, because it is always safe to offer to coöperate with anybody when you know he will not cooperate with you; (2) a speech by M.

Méline, an old protectionist and agrarian, and now prime minister, in the Assembly at the same time, in support of the resolution; (3) the existence of a bimetallic league in France, with Méline for President; (4) a conversation Mr. Hoar had with Mr. Balfour in England at a lunch with a "brilliant company," in which he described Sir William Harcourt's and Mr. Gladstone's position towards silver as "brutal"—a thoroughly Bryanite expression.

Mr. Hoar refrained from mentioning, however, that the present Chancellor of the Exchequer, Sir Michael Hicks-Beach, had announced in the House of Commons that though some of the Ministry were bimetallists, they had not the least idea of carrying out their views. They would not dare to attempt such a thing. Bimetallists who know anything whatever about currency are generally considered in the business world slightly cracked persons, or persons in financial difficulty, but there is not one of them with less authority in finance than Mr. Balfour. He has no more than Mr. Hoar himself. Yet, in spite of the monstrous assertion which he based on this evidence, we are told Mr. Hoar's "speech attracted great attention on the floor and in the galleries." We see here how the decline of the Senate comes about. Scraps of information gathered up on a summer trip by an old man, and converted into a speech on a subject of which he knows little, make a sensation and set scores of crazy silverites shouting and predicting.

The truth is, that men who are already fanatical bimetallists, or whose heads are weak financially, when they run over to England go naturally to or are seized hold of by bimetallic brethren, who fill them with astounding stories about the growth of affection for silver in England, and especially about Mr. Balfour's passion for it; Mr. Balfour being of no consequence as a financier at all. He showed that in Parliament at the opening of last session, by allowing the Chancellor of the Exchequer to announce that, though First Lord of the Treasury, his opinions about currency would have no influence on the Cabinet. Of course, no first-class financier would consent to occupy such a ludicrous position. Bimetallists of the Hoar school also denounce Sir William Harcourt and Mr. Gladstone as "brutal"; silver being in their minds, as in the minds of the Bryanites here, a living entity, to which one may be unkind or cruel or false. The fact that Mr. Gladstone and Sir William Harcourt are among the greatest, if not the very greatest, financiers in the world, makes no impression on them, and they are often, as in Senator Hoar's case, so silly as to scoff at their authority and accept that of Mr. Balfour, a rather youthful though very clever metaphysician, who has no experience of finance at all.

If one wants to know what is likely to happen in England, he should keep sternly away from the bimetallic sect in London and from embarrassed country squires, and go among the business men in the City, who are all-powerful at the Treasury, who know all about currency and carry on the prodigious British commerce, and find out what they think about the pound sterling and the double standard. But even then it would be absurd for an old and ill-informed man like Mr. Hoar to come home and blurt out his half-baked and ill-digested scraps of information in the Senate as things which should now guide American opinion and shape the policy of the next Congress. We are just settling down to rational dealing with the currency, and the only purpose that can be served by foolish bills like this bimetallic-conference bill, and foolish speeches in support of it, is to unsettle the public mind, and furnish the crazy men in Congress with excuses for postponing or hindering salutary legislation.

THE NICARAGUA CANAL DEBATE.

Two more days were consumed in the Senate last week on the Nicaragua Canal bill. The debate was reopened on Tuesday by Senator Daniel of Virginia, who drew attention first to the point made by Minister Rodriguez that the contract between Nicaragua and the canal company provided that in no case should the concession or franchise be transferred to Governments or to foreign public Powers, whereas the pending bill itself provided for transferring it to the Government of the United States. This, said Mr. Rodriguez, must "inevitably conduce to the forfeiture of the contract." Another clause provides that, in case of dispute between the canal company and Nicaragua touching the interpretation of the contract, the question shall be referred to arbitration in a specified mode and manner. Now, said Mr. Daniel, suppose that Congress, in the face of this provision that the canal franchise shall not be transferred to any Government, passes a bill transferring it to itself, how can it ever exercise any powers under it? How can it ever call for an arbitration? "There is," he continued, "such a thing in the law known as 'election,' and it ramifies through all equitable and runs into legal jurisprudence. The fundamental principle of the law of election is that no man can dispute the title under which he claims, nor make with respect thereto any contradictory or inconsistent claim." In other words, the contract forfeits itself, and the claimant under it cannot dispute it.

To this nobody made any direct answer, although there was some desultory talk about a corporation of which the United States owned 70 per cent. of the stock—implying that the thing would be different if its name were changed. It was assumed in a hazy way that if the ownership were divided into shares, there could be no valid objection to the transfer of the canal to a government in that way. But the contrary was proved by the very fact that Minister Rodriguez advanced it as an objection. Senator Morgan raved as wildly as ever about this branch of the question. He didn't believe that the Government of Nicaragua had ever authorized Rodriguez to make any such communication, although the latter had expressly said that he did so at the request and desire of that Government. Morgan clung to the theory that Great Britain was doing it all. Senator Daniel expressed some readiness to believe that charge, but at the same time asked for some small scintilla of evidence to support it. Of course he was not accommodated. Morgan said that he would like to tell all that he knew, but by the exercise of much self-restraint he refrained.

It is evident from the tenor of the Rodriguez communication that the Government of Nicaragua considers this point a material one. It must have so considered it in the beginning, else it would not have put such a stipulation in the contract. The reason is that Nicaragua is an inconsiderable Power. Like all weak governments, it desires to preserve its independence. To do this it will naturally seek to prevent stronger governments from gaining a foothold in it, as England, for example, has gained one in Egypt by reason originally of her ownership of Suez Canal shares; for although she owns less than a majority of the shares, she is the only government that owns any, and it was because of her interest in the canal that she overthrew the Arabi rebellion and took possession of the country. Nicaragua was quite right in guarding against such an eventuality in the first place, and she is quite within her right in insisting now that that clause of the contract shall be observed.

Mr. Daniel called attention also to the statement of Col. Ludlow, the chief of the Government engineering party that went down there to make an examination and report. Col. Ludlow gave testimony before a House committee in which he said:

> "We are the only engineers who have ever been over the entire route, and in making that statement I do not make any exceptions."

This is the officer who, in conjunction with two others, reported that it was not yet demonstrated that the canal was a practicable undertaking at any rate of cost, but that the minimum would be $133,000,000. He afterwards said, in his oral testimony before the House committee, that he was sorry he did not put the minimum at $150,000,000. No Senator in the debate said or hinted that the amount provided for in the bill would be sufficient. It was evidently regarded as a "starter," like the initial appropriation for a public building in Squashville. Here again it is the first step that costs. After $100,000,000 has been spent, of course we shall not stop and lose what

we already have put in. We shall go on as long as our credit lasts.

That there is money in this job is evident to the most casual observer. What is the desperate hurry about passing this particular bill? Senator Sherman made the very reasonable suggestion that it be laid aside, and that the business be resumed by the negotiation of a new treaty with Nicaragua, so that we can all know where we stand. This struck Senator Aldrich as tantamount to the death-knell of the enterprise. Of all the groundless speeches made on this subject (excepting, of course, those of Morgan), the speech of the Senator from Rhode Island had the least grain of sense or reason. He concluded with these words, Senator Vilas having moved to refer the bill to the committee on foreign relations:

"The pending bill is as carefully guarded, I believe, as any other measure that has ever been presented to the Senate of the United States. It is the only way by which the canal can be built. The real friends of the project should understand that any such suggestion or motion as that made by the Senator from Wisconsin means the death-knell of the canal, which I believe is very dear to the hearts of the American people. Senators may talk about it, and twist in various ways in regard to it, but the Senator from Wisconsin knows as well as I do that his own purpose is to kill the pending bill and to kill the project for a canal, to which he is and always has been opposed. I trust no such delusive suggestion as that which has been made by the Senator from Ohio—which is in the future so far that no man in this chamber will live long enough to see it realized—will prevent the real friends of the measure from voting against the motion of the Senator from Wisconsin; and I certainly hope that our regard for the Senator from Alabama (Mr. Morgan), and for his labors in this behalf through a long series of years, will prevent this body from ever sending a bill reported from this committee to another committee for revision. I agree with the Senator from Alabama that a suggestion of that kind is an insult to his committee and to himself."

What was wanted at this juncture was just this kind of an insult to Morgan, and this is what he came near receiving. As for Aldrich, it is not possible that he believes that the isthmus of Central America will run away, or that this is "the only way by which the canal can be built." The real friends of the project whom he has in mind are the owners of this dead contract, and others, who are ready to handle the $100,000,000 of bonds and the future issues that the first one will lead to. It would be much nearer the mark to say that the canal cannot be built at all without the consent of Nicaragua, and that she has declared, through her Minister, that the very act by which it is proposed to build it is in conflict with the terms of the original grant.

THE MORAL OF IT ALL.

All friends of good government have really reason to be grateful to Gov. Black for the appointment of Payn. The American public, as has often been remarked, learn from events and not from books or articles. We, at least, have not failed during the last ten years to point out, in season and out of season, what the present mode of nominating, by conventions based on primaries, would probably lead to. From the certainty that the party would accept the nominations of the conventions, and from the popular indifference to the composition of the conventions, it was quite easy for any one who had even a slight acquaintance with human history to predict the government we have set up in this State. And this State has been, it must be remembered, since the foundation of the republic, the originator of nearly every abuse and divergence from the straight path. The spoils system began here, and here the party caucus came to perfection. The election of Hill, of Flower, and of Murphy, the Maynard fraud, and, above all, the defences of this fraud on the stump, were warning signals that the moral judgment of the State was parting with its right to fill the State offices, and with its power to call officers to account.

This error, grave as it was, we made haste to amend and try to atone for by defeating the Democrats by enormous majorities. We cast out Hill and Maynard and dismissed Flower in disgrace. But we left the source of the mischief untouched. We left the nominating convention, filled with the boss's delegates sent up by fraudulent primaries, just as it was. We put in a respectable Governor, but we left the whole government of the State, including its Legislature, in control of another boss. We had simply changed masters. We found that Platt's form of government was identically the same as Hill's, that the Republican governing class was exactly the same as the Democratic governing class in its political morality, and that what they all differed about was not policy or measures, but the distribution of the offices—a difference which they found it easy to settle by a "deal." In short, it burst upon us that our nominating system had really ended in depriving us of the time-honored remedy of removing abuses by turning the men in power out of office.

This was brought home to us by the resolute opposition of the Platt faction to the city reforms which we sought to work in 1894, and still more by the huge frauds wrought by this faction in the primaries in 1895. The better class among the Republican politicians took the alarm and sought to mend matters by investigation and exposure. This brought out the fact that even these gentlemen had caught the contagion, for they refused to take any action in consequence of their discoveries, and published the astounding doctrine that to punish or proclaim these frauds would embarrass and injure the Republican national administration—that at this juncture it was the duty of good citizens to make friends with the perpetrator; and the result was simply a "harmony dinner."

Is it any wonder that a system thus permitted or promoted, even by good citizens, should result in Black as Governor; that Black should result in Payn; that Platt should be made United States Senator; that we should have a Legislature obeying his orders like a corporal's guard; that we should have a State Senate refusing to examine the Governor's nominations lest the Senators should lose their means of livelihood; that the whole class of politicians of both parties should disregard public opinion, meet its remonstrances with contempt and its horror with laughter; that silence should be substituted for discussion, and "jamming through" for the constitutional mode of passing bills? We do not believe that all these things are isolated events. We believe they are part of a plan to make boss government, as we now see it displayed, the permanent government of the State; that it is understood and has been agreed on by the leaders on both sides, and under this agreement no majority at the polls either way will be able to produce any change except a fresh distribution of offices. It is a well-arranged, and, as we perceive, a perfectly workable system. The boss controls the Legislature and fills the offices; and the Legislature, by legislation or by threats of legislation, supplies him with the revenue necessary for his operations. The partnership is complete: the contests at the polls are like the sham battles of the condottieri in Italy in the Middle Ages.

We believe, too, that the Greater New York charter is part of the scheme; has been devised simply to prevent the growth of the non-partisan movement in the city which was initiated in 1894, to provide a greatly increased number of offices as spoils, to keep alive in the city, by frequent elections, the fever of political faction, and to hide from the masses the real seat of responsibility. The furious haste in its passage, the unwillingness to submit it to the people, the preservation in it of the bi-partisan Police Board, the creation of a large, powerless, and salaried Legislature, combined with the crusade against the competitive system headed by the Governor, go to confirm this view. We are more sorry than we can express that at such a crisis in the history of the State, when all the powers of darkness are united for a final attempt on what we most value in our institutions and in public life, men like Gen. Tracy and President Low should be found giving the weight of their authority and the help of their ability to such an enterprise, for that is what they are doing. They are aiding in an assault on free American government. The pity of it is the greater because no one has, with a more powerful pen or from a longer experience than President Low, denounced, in book and magazine, the very evils he is to-day helping to bring about. The greater the public respect for him (and it is very great), and the greater the public gratitude for

his past services (and this too is very great), the deeper the regret that he should be now giving the smallest aid to the unscrupulous band who have marked the city and State for their prey.

THE HOLY CITY OF KERWAN.

KERWAN, November 22, 1896.

NEXT to Mecca, the birthplace, and Medina, the burial place, of the Prophet, Kerwan, or Kairwan, or Kérouan (as the French write it—it is a dissyllabic word, strongly accented on the last syllable) is the most sacred city of the Mohammedan world, surpassing Constantinople and even Jerusalem. What it is that constitutes sanctity to the Mussulman is not always easy to determine. In the case of this city the determining cause seems to be the fact that it was founded by a group of companions of the Prophet, headed by the famous conqueror Sidi Okba ibn Nafa, and that it contains the tombs of an unusually large number of saints. It is one of the few African cities that have risen on a site unprofaned by any heathen or Christian associations. Okba ibn Nafa chose (in A. D. 670) the spot himself during his conquest of North Africa, laid out the plan, and fixed the site of the great mosque which has given the city its fame among Europeans. Why the spot should have been selected does not readily appear. There are no natural advantages. It is quite level, and therefore not fitted for a stronghold. There are no springs near, and the lower slopes of the hills that rise fifteen miles to the westward, where water is plentiful, would have seemed a fitter place for the dwellers in such a parched and thirsty land. Perhaps, however, the very openness of the country may have been a recommendation to those who desired to be able to see from afar the approach of an enemy; the distance from the sea would make a sudden attack by the East Romans, who still ruled that element, less likely, and the plain, though now in parts sandy and in parts condemned to sterility by the saltness of the soil, may in the seventh century A. D. have been better watered and more fertile.

The city stands about thirty-five miles westward from the sea at the port of Susa (the ancient Hadrumetum), and is now easily accessible, for the French have just opened a railway to Susa from Tunis, and there is a tramway and also an omnibus service (of five hours only) from Susa to Kerwan. Approached from the east, its aspect is striking, for the walls rise straight out of the bare plain, with no suburbs to break the effect, and the whole place is, like most Moorish towns, of a dazzling white. To the north, the west, and the southwest, distant mountains close the view and frame the white jewel that glistens in the centre of the plain. Within, the streets are narrow and crooked, and the bazaars, or Suks, as they are called in this part of North Africa, are far inferior to those of Tunis in size and in the variety and quality of the goods displayed in them. Carpets are pretty largely manufactured and exported, some of the patterns being characteristic of the place, so that they are known over the country as of Kerwan make. But of late years the workers have begun to use mineral dyes, and the colors are therefore by no means so pure nor the harmonies so pleasing as was once the case. The houses are all low, nearly all of one story only, with flat roofs. They are kept constantly whitewashed, which gives an external air of cleanliness much belied by the interiors as well as by the condition of the streets. Although the French have now occupied the place for fifteen years, and keep a pretty large garrison, they have not substantially changed its aspect, which remains as thoroughly Oriental and as full of all the kinds of picturesqueness one associates with the Orient as it ever was. Cairo is more beautiful, and contains a far greater number of remarkable buildings, as well as of private houses with pretty bits of woodwork. But Cairo is being rapidly modernized, and has a large new Frank quarter in the handsomely monotonous French style. Kerwan, comparatively poor and rude, recalls the 'Arabian Nights' better than does any other considerable African city, while the profusion of mosques in it and of the tombs of saints all round it maintains its sacred character.

The largest and the most sacred of the mosques is that of Okba ibn Nafa, occupying the spot which he marked out, although the existing buildings, or most of them, seem to be a little later than his time. It covers a large space of ground in the northeast corner of the city. There is a great open quadrangle about as large as Trafalgar Square in London, and surrounded by a sort of arcade supported by pillars, like the cloister of a monastery. The pillars are arranged in pairs, as in the cloister of St. John Lateran at Rome. On the east southeast side of this court, the side towards Mecca, is the mosque proper, or Maksura, the chamber where public prayer is offered up; and it is this chamber which constitutes the special and almost unique feature of the building. It is rectangular in shape, but broader than it is long—that is to say, the length from the entrance to the sacred Kibla at the east end is less than the transverse length, at right angles to the line joining the door with the Kibla. Within it there are two hundred and ninety-six columns, of nearly uniform height, supporting horseshoe arches, which themselves support the flat wooden ceiling. The arches are not very wide or high, and the columns comparatively slender. They are all of marble or some still harder stone, such as porphyry or granite, and polished, and have evidently been brought from ancient Roman temples or Christian churches, perhaps (if one may judge by their style) from churches erected as late as the sixth century. Some have probably served in both capacities, for the Christians commonly used the columns of disused temples in erecting churches, as Justinian did those of the great Ephesian shrine of Diana when he built St. Sophia at Constantinople. The floor is of marble slabs, doubtless also brought from ancient edifices, and put together rather roughly. The general effect of this interior, which looks about as large in its area as the House of Representatives at Washington, though it is, of course, much less lofty, is very singular, particularly as nearly all the light comes through the doors on the side next the great court, very little finding its way through the few small windows of stained glass. One seems to stand in a sort of forest of pillars, with vistas opening in all directions through them; and the mingled uniformity and variety—uniformity in the plan, variety in combinations of the pillars according to the angle of sight, and in the effects produced by the fall of light and shade—has a striking and quite peculiar charm. Large as is the chamber, one fancies it much larger than it is, for the lines of columns seem interminable, and the shadows are deep in the furthest corners.

Only one other building in the world has a similar plan and makes a similar impression. That one is the great mosque at Cordova, itself erected in imitation of Sidi Okba's mosque a few centuries later, and turned by the Spaniards into a church after their conquest of Andalusia. The Spanish building is the larger and more beautiful of the two, as one might expect from the work of sovereigns so much superior to these Moors as were the Khalifs of Cordova. Its floor space is ampler, its roof loftier, its columns taller, its coloring richer. It is, moreover, well kept, whereas there is a certain roughness and untidy neglect about the Kerwan mosque; for here, as in Egypt, the Mohammedans show little taste or æsthetic feeling, and bring the sanctity of a building into no relation with its cleanliness. But the Cordovan mosque has been defaced by the intrusion into its centre of a high Gothic choir, a crime of the sixteenth century which called down the indignation of the Emperor Charles the Fifth. And it suffers from the altars and images introduced for the purposes of worship. The Kerwan mosque stands untouched, with that noble simplicity and plainness which gives so much dignity and strength to a Mohammedan house of prayer.

Unquestionable as is the preëminence in splendor as well as in finish of the daughter mosque in Andalusia, the parent mosque of Africa is not less interesting to the historian and to the student of architecture. What suggested this bold idea of a chamber filled with columns and arches is not known, any more than the name of the architect. Mr. Freeman thinks it most like the crypts, filled with pillars, of some Christian churches. But it seems more probable that the idea was taken from some of the many-naved Christian basilicas which the Arab conquerors found in Africa, such as that whose floor has recently been laid bare by the excavations at Carthage. They, too, were filled with columns—it was, indeed, with their spoils that Kerwan was largely built. They were hardly longer from door to altar than they were wide in a transverse line. No great changes would have been needed—and they would be changes in the direction of further simplicity—to turn them into the rectangular pillar-filled hall which the mosques of Kerwan and Cordova present.

There is not much else that is noteworthy in the building. Both the Kibla, or semicircular recess indicating the direction of Mecca and corresponding to the central apse or "tribune" of an early Christian church, and the Mimbar, or pulpit, are lined with thin plates of wood covered with rich and delicate arabesque patterns, very finely carved. The wooden walls of a sort of enclosure where copies of the Koran were kept, something like a Christian sacristy, are similarly decorated. But colored tiles, the favorite and often very delightful form of Moorish ornament, are absent. The whole air of the mosque is one of severe and primitive simplicity. Nor among the numerous other mosques — there are said to be three hundred, counting in the saints' tombs which are used as places of prayers (a number greater for Kerwan than the traditional three hundred and sixty-five churches of Rome, a so much larger city)—is there any remarkable either for its beauty or its architectural features, save one. This is the so-called Mosque of the Companion (called by Europeans the Mosque of the Barber), which stands half a mile outside the walls. It is comparatively small, consisting of three arcaded courts, with passages connecting them, all lined with tiles,

and its central shrine is the tomb of Abdullah ibn Zemaa, one of the Companions of Mohammed and conquerors of Africa. But the proportions are admirable, and the decorations, in white marble and colored tiles, are quite exquisite in the depth and purity and fine harmony of their tints. Exquisite, too, is the Moorish plaster work on the upper part of the cloister walls. Taken as a whole, this mosque is one of the loveliest pieces of work which Northern Africa possesses, and, taken along with the Great Mosque, justifies Kerwan in claiming to stand beside Delhi with its Kutub Minar, and Agra, with its Taj Mahal, and Constantinople with its Suleymanieh Mosque, and Bijapur with its huge and solemn tombs of departed Sultans, as the cities in which Mohammedan invention, so weak and infertile in nearly every other direction, has shown that it could accomplish great things in architecture.

Filled with the tombs of saints and steeped in the traditions of a militant Islam, Kerwan was long regarded as a hotbed of Mussulman fanaticism. When the French invaded the territories of the Bey of Tunis, they expected a serious resistance from the Kerwanese, and sent a considerable force against them. The place, however, was occupied without difficulty, and a French general, according to the current story, was even suffered to ride his horse into the Great Mosque, as Mohammed the Second did into St. Sophia when he took Constantinople in 1453. The fortunate result of the entrance of the French into the mosques in 1881 has been that these buildings, having once been profaned by the feet of infidels, may now be visited by other infidels. Accordingly, while in Morocco and in every other town of the Tunisian Regency no Christian is suffered to enter a mosque, here in Kerwan one may freely enter and examine everything to one's heart's content. Oddly enough, the matting with which the marble pavement of the Great Mosque is covered seems to be held more sacred than the pavement itself; for when the Christian visitor enters, the matting is rolled back and he walks on the pavement, though of course he may, if he slips off his shoes, walk on his stocking soles over the matting also. Nor do the inhabitants seem specially fanatical; at any rate they make no hostile demonstrations when one rambles alone through the streets. Ignorant and superstitious they are to the last degree, as may be judged by their belief that the holy well of the city, where a sacred camel, used for no other work, raises water by a windlass under a sacred cupola, is connected by a subterranean channel with the well Zemzem at Mecca. The Kerwan well is only seventy feet deep, and Mecca is more than two thousand miles distant, with a bay of the Mediterranean as well as the Red Sea between.

From the top of the highest minar of the Great Mosque, a heavy square tower of three stories surmounted by a cupola (these solid mosque towers of North Africa are quite unlike the slender minarets of Constantinople), one enjoys a wide and striking view. To the south, and to the east also (for the sea, though less than forty miles distant, is hidden by the undulations of the ground), the eye ranges over an immense plain, bare and featureless, unbroken by stream or tree or building. Far in the north the noble peak of Jebel Zaghwan, fifty miles away, and nearly as far from Carthage on the other side, measures the distance between the sacred centre of African Mohammedanism and the ancient metropolis of African Christianity. Westward, isolated groups and long ridges of mountains rise, the nearest fifteen, the furthest some sixty or seventy miles distant, but all clear and sharp-cut in this dry and lucent air, and taking, in the level lights of morning and evening, the most delicate shades of blue and violet. Lovely as are the colors, and full of solemn dignity as is the vast expanse of plain, with the white city glittering in its midst, a more melancholy prospect cannot be imagined. The country is not quite so unpeopled as it appears, for the huts and tents of the half-nomad Arabs are scattered here and there over it, and a certain part of the soil is tilled by them or pastured by their flocks. But it is utterly void of trees, except a few olives in the distance, whose low size and gray hue make them scarcely noticeable; and not a hamlet, much less a town, can be discerned—only here and there the white dome of a marabout's tomb. Fifteen centuries ago this region was one of the most prosperous and densely peopled in the world. Two days' journey to the southwest stood the city of Sufetula, the last capital of the Christian ruler whom the Arabs overcame in A. D. 647. Fifty miles off to the southeast stood the city of Thysdrus, the ruins of whose gigantic amphitheatre, second only to the Coliseum at Rome, an amphitheatre capable of holding 60,000 spectators, still rise over the waste to attest the former wealth and luxury of the African subjects of Rome. Few spots in the world show a more striking contrast between the past and the present, or bear more impressive witness to the effects of Mussulman conquest. It is not only the brutal Turk but the far more naturally capable Arab—the Arab who in his earlier days showed a capacity for assimilating some forms of Roman culture and of imitating, even improving upon, Roman architecture—who, under the influence of his faith, has brought darkness and desolation upon the seats of ancient civilization.

C. E.

CRÖY'S MEMOIRS.

PARIS, January 22, 1897.

MEMOIRS on modern times, and chiefly on the Napoleonic period, are all the fashion; they are very extensively and universally read, and console the public for the nauseous mediocrity of our novelists. From time to time there appear, however, memoirs on older periods which are worthy of much attention. I would advise all who are interested in the history of France to read the 'Memoirs of the Duke de Cröy on the Court of Louis XV. and of Louis XVI.' The Cröy family (the name is pronounced Crouy) is one of the greatest in the northern part of France and in Belgium. The author of the Memoirs was born on June 23, 1718, in the château of Condé (a *chef-lieu de canton* of the Department of the North, not far from Valenciennes). The Memoirs were discovered not long ago in manuscript in the library of the Institute by the Viscount de Grouchy; he published only some extracts from them in the new *Retrospective Review*—extracts relating chiefly to the military career of the Duke de Cröy, who was in the service of France and became a Marshal. He gave also to various periodicals detached fragments—to the *Review of Diplomatic History* a fragment on the Embassy of Marshal de Belle-Isle in 1742; to the *Bulletin du Bibliophile* three fragments, on a visit to J. J. Rousseau, on the last moments of Voltaire, on the British Museum; to the *Britannic Review*, a Journey to England. Last year M. de Grouchy collected from the Memoirs all that related to Cröy's life at the courts of Louis XV. and Louis XVI., and he has just published these long extracts in a volume.

Let me say at once that Cröy has no literary pretensions of any sort: his style is most simple and unaffected; but after you have read a few pages, you get at once the impression of perfect truthfulness and exactitude. His sincerity is complete, he does not give himself out for a great statesman, or a great soldier, or a great reformer. He is essentially a gentleman and a courtier. He knows that he must make his way at court—it is his natural place; his birth entitles him to be among those who can live with and near the King; he must share his pleasures, hunt with him, follow him in endless journeys from castle to castle, dine and sup with him, play cards if necessary, take part in all the great functions. He does not particularly like this court life, being a quiet and religious man; he has none of the vices of the King's favorites. But he must advance himself and get promotion in the army. He leaves the court to go to the army, he leaves the army to stay some time at court. He knows and understands no other life. He is the perfect courtier and the perfect soldier.

At the age of eighteen Cröy joined the Mousquetaires; at the age of nineteen he went to his first ball at Versailles. He had in the same year the honor to hunt for the first time with the King. Hunting was the favorite pleasure of Louis XV., who from 1732 to 1759 brought down no less than three thousand stags. The King kept three packs of hounds, and was thus able to hunt every day. He used to kill two or three stags every time he hunted. It was a very laborious life. After the hunt the King gave the names of those who were to sup with him in his cabinet. Cröy was named several times, with others. "I found myself at the little table with seven young gentlemen. At the great table were fifteen people, among them Mademoiselle [Louise de Bourbon-Condé], Mme. de Mailly, and four other ladies. After supper, the King designated me to play *cavagnole* [a game of chance played with balls] with Mademoiselle, and gave me the cards himself." Cröy, for this first invitation to the royal hunt, had to buy himself three horses; he rode besides with three horses from the royal stables—he gives us their names, Brutalin, Mirliton, L'Indolent.

The Journal, for Cröy's Memoirs have that form, reports with the greatest minuteness the details of all the hunting expeditions, all the balls, dinners, and suppers, the representations at the opera, interrupted here and there with references to the various topics of the day. At the age of twenty-three Cröy was married to Mlle. d'Harcourt, daughter of the Marshal Duke d'Harcourt. "On Saturday, February 4, [1741], we went, my mother and myself, to the Hôtel d'Harcourt, where all the family was assembled, to make our asking. An hour afterwards were read and signed the articles which had been prepared the day before. The next day, February 5, the Duke d'Harcourt took me to Versailles, to solicit the assent of the King, the princes and princesses. . . . On February 9, the contract was signed by the King, the Queen, the Dauphin and Mesdames." The marriage took place on the 18th: "My regiment, my marriage, my war equipage—all these expenses coming together deranged my affairs at the time to the extent of 300,000 livres, by no fault of mine." The marriage seems to have been a happy one. Cröy tells us that, "on

March 12, my confessor being at the time preacher to the King, I went to Versailles to make a general confession, and from that time I adopted a mode of life quite different from what it had been for several years."

He continued, however, to be an assiduous courtier, whenever his duties did not keep him in his regiment. He notes all the intrigues of the court. He does not give many details concerning the sisters De Mailly, who became successively the mistresses of the King. One of them, Mme. de la Tournelle, "seems to take on a high tone, without having much power, apparently, over the mind of the sovereign, who is still resolved not to allow too much influence to the women." This resolution was not kept for ever, and we see in the Journal how the almost absolute empire of Mme. de Pompadour became established by degrees. Cröy became perforce acquainted with her, and gives many interesting details about the famous marquise. "As for the sovereign," says Cröy, "he is more talkative and more free in his mind since his campaign [1746]. He appears to have fallen deeply in love with Mme. d'Etioles, named Marquise de Pompadour, his openly declared mistress. She received all the court in her apartments, almost did the honors of it, and everybody rushes to her." Cröy was presented to her by his father-in-law, Marshal d'Harcourt. "She seemed to me charming in face and in character. She was at her toilette, and nothing prettier can be imagined. She had a variety of amusing talents so that the King seemed to love her more than all the others. . . . She was on a good footing with the King, having advised him to act well by her, making her come to Paris, and giving her a place on all occasions. . . . She took part in the Queen's game, carrying herself with much decency and grace, and I remarked that when the hour came to go to the small cabinets she asked the Queen's permission to leave the game; who bade her amicably 'Go.'" Here Cröy cannot help commenting in parenthesis, "What a fine remark to make for a philosopher and a Christian!" In these cabinets he speaks of, there was generally a repast, then an hour or two of play; and only a small number of the most intimate courtiers were admitted, as Louis XV. was essentially a creature of habit, preferring his old acquaintances and not liking new faces. Cröy gives us on various occasions the lists of the persons with whom he supped in the small cabinets; the same names reappear often, many of them unknown to history. The King warmed his coffee and helped himself to it; no servant was seen - everybody had to take care of himself.

Mme. de Pompadour's influence became omnipotent. She was very intelligent; she had a charming character, and took great pains to please everybody. "Not only the great affairs, but all the details passed through her hands. I remarked the easy manner in wnich she walked before the duchesses, with the greatest politeness, sitting down at the *grand couvert* when the Queen and all the children of France were there; but all took care to please her, and she was nice to them." In 1756, to everybody's astonishment, on February 8, Mme. de Pompadour was officially proclaimed a *dame du palais* of the Queen. She announced at the same time that she had resumed religious observances. She fasted in the cabinets, which she had never done before. She had conferences with a Jesuit father, whom she chose for a confessor. "She began her service near the Queen as quietly as if she had never done anything else. She went to mass every day, and seemed to pray with fervor." As she had never appeared false in anything, the Court wondered if she would recall her husband and break completely with the King. Cröy says on this head: "As for myself, whom a little reflection on men and on courts had rendered philosophical and incredulous, I believed that in time people get accustomed to everything, and that, when you have supreme authority, you can make impossible things easy."

The particulars which Cröy gives on this new period of Mme. de Pompadour's reign are interesting, even in a psychological point of view. The King and his friend had a new *modus vivendi;* the Marquise shut her eyes on the King's fleeting love affairs, which were kept as secret as possible; she was content to be the favorite, the adviser. She preserved all her favor, all her influence. In 1756, Cröy writes, that, coming from the army, he calls on the Marquise, at ten o'clock in the morning, and finds her going to mass incognito. She had ceased to go to the theatre, she had ordered the passage by which the King went to the little red cabinet to be shut. The King could no longer visit her except through the big room where persons of the highest rank were waiting; it even often annoyed him. Nevertheless, she ate, in full dress, beside the King in the cabinets. All this was a singular mixture, not easy to understand.

Mme. de Pompadour fell ill in February, 1764, and died on April 15, with much courage, in her forty-fourth year; and "thus terminated one of the longest reigns of this sort which were ever seen. It had begun in 1745, when she was twenty-four years old; it had thus lasted twenty years." When you read Cröy's Journal you come to the conclusion that the Marquise was completely used up by the fatigues of her life. Louis XV. must have had an extraordinary constitution. She had to bear all his fatigues, to follow him everywhere, to be perpetually in motion and to amuse him without interruption. She sometimes wondered how people consented to live at court who could lead easy and quiet lives in their châteaux. On the whole, she was regretted. She was good and generous; "there was not an employment, not a favor which did not come through her hands; she never willingly harmed anybody, but France suffered many misfortunes during her time, and many useless expenses were incurred for or on account of her." It has been said that the King, seeing her funeral procession pass before the windows of the château at Versailles, said coldly: "La Marquise a mauvais temps." This story has been denied by Dufort de Cheverny (see his memoirs). The King was alone with Champlost, his first valet, when the procession passed before the palace. He knew the appointed hour; notwithstanding the cold and severe weather he remained bareheaded on the balcony, and, when he lost sight of the carriages, he reëntered the apartment, with great tears on his face, speaking to his valet only these few words: "This is the sole duty I can pay her."

Correspondence.

CIRCUMSTANTIAL EVIDENCE.

To the Editor of The Nation:

Sir: It is now nearly a year since the senior Senator from Massachusetts enlightened the community in regard to circumstantial evidence by quoting an old East Cambridge (Mass.) judge as saying in a charge to a jury: "Gentlemen of the jury, circumstantial evidence is when a fact that is known proves a fact that is not known. If you see great activity in the navy-yard over there to-morrow, it is not a proof that war is approaching, but that an election is approaching."

If the old judge is still alive, it would be interesting to learn his views on the sudden cautious dignity in our foreign policy assumed by the Senate when the arbitration treaty came up for discussion, and whether he would hold that we have proof that that body has reformed, or that a new Administration is approaching.

John Alden Lee.

Milton, Mass., January 26, 1897.

IRRITATING THE SENATE.

To the Editor of The Nation:

Sir: Apropos of your second paragraph in "The Week" of the *Nation* of 28th inst., concerning the supposed danger of irritating the Senate by appeals and remonstrances urging the ratification of the arbitration treaty, I am reminded of a passage in Edmund Burke's speech, in the House of Commons, in 1794, in favor of avenging by retaliation the execution, by the French Government, of French emigrants found in the English army. He said: "God forbid that the authors of murder should not find it recoil on their own heads! But fears are expressed that we may inflame the Jacobins by severity. Inflame a Jacobin! You may as well talk of setting fire to hell! Impossible!" (See Stanhope's 'Life of William Pitt,' vol. ii., p. 228.)

Truly yours, Edw. Y. Buckley.

1508 Spruce St., Philadelphia,
January 31, 1897.

HOW A UNIVERSITY IS BUILDING.

To the Editor of The Nation:

Sir: Some of your readers will doubtless be interested in a correct statement of the wonderful growth of the University of California and of its peculiar system of accrediting.

The reactionary movement of the later seventies gave us the new Constitution of '79, which aimed a deathblow at secondary education by cutting off all State support from high schools. The blow stunned, but did not kill. Most of the high schools ceased, and few, if any, new ones were formed for several years. Thus a great gap existed between the grammar schools and the University. Deprived of secondary schools, the University languished. Few students outside of the large cities could add the expense of preparation to the cost of the University. Public sentiment, as seen in the new Constitution, was opposed to high schools, and therefore to the University itself. Local sentiment followed general sentiment. Communities were slow to feel that high schools should be supported by local taxation, and became satisfied with grammar-school attainments for their children.

The University had long been financially crippled. In '87 it was put upon a sound basis by a State endowment of one cent on every one hundred dollars' worth of taxable property. It might now look to a larger field of usefulness. In '88 the University decided to do something in aid of secondary schools. Accordingly one of its professors became a home missionary to the few high schools then in ex-

istence and to the larger communities where such schools seemed possible. During the two or three years following, these schools and communities were visited by several members of the faculty, resulting in a general awakening of high-school interest. Ten years ago there were but nineteen high schools; now there are 106, with an attendance of 10,361. Up to 1891, high schools could be established only in cities. In 1891 and 1893 the Legislature provided for county and union district high schools. Thus within ten years the high school has moved out from a few large cities and established itself within easy access of almost every rural district.

Each year adds to the rapidly increasing number of high schools, and gives to hundreds of young men and women the preparation and ambition for college. So many, indeed, received such inspiration that the resources of the State University would have been inadequate to accommodate them. Fortunately for California, the Stanford University was established in the early part of this educational awakening, and has proved a noble coworker with its Berkeley associate, sounding a bugle call to higher education, and dividing with Berkeley the applicants too numerous for a single institution. Instead of three hundred students at Berkeley, there are now twenty-six hundred at our two great universities.

Has this increase been obtained by lowering the standard? By no means. The standard for admission has been raised and work in the University greatly improved. Within three years a year has been added to the admission requirement in the main courses, and a large number of high schools have lengthened their courses to four years, all being formerly three. The instruction in the high schools has been more thorough. Each year a larger and larger number of university graduates have appeared as teachers in the high schools. Each year a larger number of high-school teachers have appeared in the summer schools at Berkeley and at Stanford. The pedagogical department of the University, through county institutes, has reached the utmost districts of the State. The grammar schools have felt the uplifting influence, and the primary schools have received a new baptism.

All these changes have been fostered, if not caused, by the overlordship of the State University. What is this system of accrediting of which "A Californian Teacher" complains in your columns? Any school wishing to be accredited makes application to the University, sending sets of examination papers. If these give promise of fair results, the school is visited by a committee from the University faculty. This committee may consist of from four to six, representing leading departments of instruction. They do not visit in a body, but go, one at a time, without warning of their coming, at any time from Christmas to June. They observe the equipment of the school and methods of instruction, and personally test the proficiency of the students, particularly of the graduating class. They make suggestions to the teachers and the Board of Education regarding the work. During these visits they do much in the community to aid the cause of education. Schools are frequently visited several times before accredited. If improvements do not follow suggestions, visits cease. Twenty schools applying last year failed to be accredited. The committee reports to the faculty, and if the school is found to be in good hands and to be doing satisfactory work, it is put upon the accredited list for the ensuing year. The graduates from such schools, upon receiving the personal recommendation of the principal, are admitted without examination. Graduation alone is not sufficient, principals usually requiring a yet higher standard for recommendation. The continuance of the school upon the accredited list depends upon the annual visit of the committee and upon the work done by its representatives during the freshman year. The last requirement prevents reckless recommendations. A school may be accredited in some subjects and rejected in others. Of the sixty-seven accredited schools, less than half are accredited in all subjects. A student may be recommended in some subjects only and required to take entrance examination in the others.

In several instances, pupils failing to secure the recommendation of the principals for Berkeley have taken successfully entrance examinations at the best Eastern colleges. In other cases, pupils failing of recommendation have successfully passed entrance examination at Berkeley. It is said by the Berkeley faculty that the best work of the freshman year is done by students received on recommendation, rather than by entrance examination. These facts show that the system of accrediting raises rather than lowers the standard of entrance. Occasionally a pupil is "crammed" for entrance; such usually fail during the freshman year. Such short notice cramming cannot take place under the accrediting system; each student must be a graduate of a full course approved by the University faculty.

Does the University use its influence over the schools for its own aggrandizement at the expense of the schools? No. It is the true head of the system, guarding and protecting all parts of it. The writer is now serving his eleventh year in the schools of California. Eight years of that time as principal of the high school and city superintendent, he has been brought into contact with the two universities and with the normal schools. There have been several meetings of the "University Conference" to consider the relations of the University to the secondary schools. To these meetings are invited high school principals, city and county superintendents, and faculties of the State University and of the Normal Schools. The writer is a member of the Committee on Course of Study for High Schools. Two University professors and three High School principals compose the committee. At the last conference it made its first report. Its members were unanimous in the opinion that a course of study should be made in the interests of those not preparing for college—that the chief function of the high school is preparation for life. This proposition was adopted without a dissenting vote from any member of the Berkeley faculty. Thus, it is seen that the University takes a broad and liberal view of the educational system of the State.

T. L. Heaton.

Eureka, Cal., January 22, 1897.

THE BURNING OF NORFOLK IN 1776.

To the Editor of The Nation:

Sir: If we are to believe the school histories of the day, if we are to believe Bancroft and Fiske, the British under Lord Dunmore, early in the Revolutionary war, burned the city of Norfolk to the ground; and yet, as a matter of fact, the destruction of that prosperous town was accomplished by the Continental forces themselves, and partly by the direct orders of the Convention of the State of Virginia.

Bancroft, in his eighth volume, describes in his most graphic manner the destruction of the city, and concludes by saying that the American commanders, Howe and Woodford, certainly made every effort to arrest the flames, and argues that troops without tents would hardly in midwinter have burned down the houses that were their only shelter. He goes on to say that "When Washington learned the fate of the rich emporium of his own 'Country,' for so he called Virginia, his breast heaved with waves of anger and grief; 'I hope,' said he, 'this and the threatened devastation of other places will unite the whole Country in one indissoluable band against a nation which seems lost to every sense of virtue,'" etc. Fiske treats of the incident briefly, and in no wise mentions the fact that the Continentals had any part or portion in the destruction of the town, but assumes that the whole conflagration was the result of the British bombardment.

Though it does not seem to be generally known, the whole question of the destruction of Norfolk was investigated in the year 1777 by Commissioners appointed by the General Assembly. Their report was made October 10, 1777, and I suppose is still on file in the Auditor's Department. At any rate, it was a matter of discussion in the House of Delegates in 1835-'36, and was published with the proceedings of that year. This report is accompanied by a schedule of all the property destroyed—time when, by whom, and value—and also by the depositions establishing the facts. It establishes that, out of 1,333 houses burned, only 54 were destroyed by Lord Dunmore, and that on January 1, when the historians state that he burned the whole town, he burned only 19 houses—32 having been burned by him November 30, 1775, and three January 21, 1776. It establishes that 863 houses were burned by the troops of the State before January 15, 1776, and that 416 houses were destroyed by order of the Convention in February. It goes on to say:

"Upon an inspection of the schedule and the depositions which have been taken, it will appear that very few of the houses were destroyed by the enemy, either from their cannonade or by the parties they landed on the wharves; indeed, the efforts of these latter were so feeble that we are induced to believe most of the houses which they did set fire to might have been saved had a disposition of that kind prevailed among the soldiery, but they appear to have had no such intentions; on the contrary, they wantonly set fire to the greater part of the houses within the town, where the enemy never attempted to approach, and where it would have been impossible for them to have penetrated."

I find this corroborated by an extract from the *Virginia Gazette*, published on board the ship *Dunmore*, lying off Norfolk, dated Jan. 15, 1776, which is to be found in American Archives, 4th Series (vol. iv., page 542):

"As the wind was moderate, and from the shore, it was judged with Certainty that the destruction would end with that part of the town next the water, which the Kings ships meant only should be fired; but the Rebels cruelly & unnecessarily Completed the destruction of the whole town, by setting fire to the houses in the streets back, which were before safe from the flames."

The only explanation that I have seen of the action of the State troops in this matter is worthy of Sir Boyle Roche. It was that they had burned the *whole* town in order that they might be better able to defend the remainder.

Yours truly, Wm. Henry Sargeant.

Public Library, Norfolk, Va., January 23, 1897.

Notes.

HOUGHTON, MIFFLIN & Co. will soon publish the Complete Poetical Works of James Russell Lowell, in a single volume uniform with their Longfellow, Whittier, and Holmes; 'The Chief End of Man,' by George S. Merriam; 'Immortality and the New Theology,' the first lecture under the Ingersoll Lectureship at Harvard, by Dr. Gordon of the Old South Church; 'The Liquor Problem, in its Legislative Aspect'; 'Greek Art on Greek Soil,' by Prof. J. M. Hoppin of Yale; 'The Spoils of Poynton,' by Henry James; and 'The Transatlantic Chatelaine,' by Mrs. Helen Choate Prince.

T. Y. Crowell & Co. announce a new and revised edition of Cary's version of Dante's 'Divina Commedia,' together with D. G. Rossetti's translation of the 'Vita Nuova,' edited by Prof. L. Oscar Kuhns, of Wesleyan University. The volume will be illustrated.

'The Student's American History,' by D. H. Montgomery, is in the press of Ginn & Co., Boston.

Thomas Whittaker has nearly ready 'In the Land of Tolstoi,' by Jonas Stadling and Will Reason; 'The Clock of Nature,' sermons by Dr. Hugh Macmillan; 'The Life and Work of Bishop Thorold'; 'The Life and Correspondence of Archbishop Magee'; and 'The Land of the Monuments,' notes of Egyptian travel, by Joseph Pollard.

Prof. Albert Bushnell Hart's 'American History as Told by Contemporaries,' which Macmillan has in preparation, will fill four volumes, delineating respectively the discovery and colonization, making, growth, and welding of the republic. The extracts, logically arranged, will be long enough to give some idea of each writer's style.

We have received from Elliot Stock, 62 Paternoster Row, E. C., London, the tenth volume of his 'Book-Prices Current,' viz., for 1896, whose American namesake has already appeared (Dodd, Mead & Co.). There is now a friendly rivalry between these two publications, though each confines itself to its own side of the water. 'American Book-Prices Current' sets an example worth following in using full-face type for the entries, and avoids the need of an author-index by discarding the division according to auction sales, and bringing everything under one alphabet, supplemented by a subject-index. This last the British work now adopts, but still clings to the sales division, for which, of course, there is something to be said. The decade of volumes now attained naturally prompts the public to call for a general index covering the series to date. Mr. Stock agrees to undertake the labor if each subscriber will subscribe to a copy at one guinea net.

The bound volume of the *Century* for May-October, 1896, shows the general touch with the times which this magazine is accustomed to keep. No articles are more notable in this respect than Mr. Bryce's three on the theatre of present political interest—now almost as great as when Mr. Bryce wrote—in Africa. That on Li Hung Chang records a passing visit and sensation. One on the X-rays seems already ancient history, though a sudden pause has come upon the popular development of this extraordinary discovery. 'Sir George Tressady' and Sloane's 'Napoleon' come to an end in this volume, which contains also a part of Felix Moscheles's 'In Bohemia with Du Maurier.'

Scribner's two volumes for the past year have also their penumbra of books to come—Barrie's 'Sentimental Tommy,' Jaccaci's 'On the Trail of Don Quixote,' and Andrews's 'History of the Last Quarter-Century.' In turning over the pages, we meet again "Vailima Table-Talk," Mr. Hamilton Busbey's "Evolution of the Trotting-horse," Mr. Cosmo Monkhouse's three papers on Leighton, Millais, and Turner as shown in the portraits of himself, together with Mr. Brownell's account of the plastic art of Olin Warner. The illustrations of this magazine run through the gamut of wood and process engraving, including reproductions of the elder lithography, and indulge in some color ventures not always pleasing when introduced in the text; more promising when applied to separate sheets.

In *Harper's Round Table* for 1896 are mingled, as usual with what is fairly to be called youthful reading, nearly as much matter that would be appropriate to magazines for adults, with not a little appealing to either age—*e. g.*, the bicycle routes; the interscholastic sport record, with its hundreds of portraits and instantaneous views in action; the camera-club prizes, etc. There is the customary marked catering to the war spirit in fiction and in military and naval descriptions, with other aids to Jingoism in articles on Cuba. Hawaii is classed among the little "republics." The book that emerges from this periodical is Molly Elliot Seawell's 'A Virginia Cavalier.' The *Round Table* commemorates the loss of two contributors in W. H. Gibson and Thomas W. Knox.

Somewhat of the mixture noticed above is discernible in the two volumes of *St. Nicholas* just concluded, but their general physiognomy is more strictly juvenile, and of a cast too familiar to call for description here. A part of the feast is Robert Louis Stevenson's "Letters to Young Friends."

The latest addition to the "College Histories of Art" is 'A Text-Book of the History of Sculpture,' by Profs. Allan Marquand and A. L. Frothingham, jr. (Longmans). In conformity with the style of the series, its material has been compressed into a small octavo volume of 293 pages, into which 113 illustrations are introduced; and as it embraces the entire range of Occidental sculpture, from the early Memphite school to William Ordway Partridge, it has suffered inevitably from this compression. With such limitations imposed upon the authors, it is hardly to be expected that they should be able to impart to beginners any appreciation of sculpture as one of the three great arts, or of the finer qualities which have distinguished its masters. In this respect the work justifies its title of text-book, from which students may learn the names of schools and epochs, their relative dates and leading sculptors; but it requires considerable expansion in the class room for a full comprehension of its characterization of the different styles which are described in it. The mediæval section seems to us to show the most skill in preparation, and the Greek the least. It is unfortunate that the book should begin with so obvious an error as the title of its frontispiece—"Ludovisi Hera, Naples." The Ludovisi Hera is of course not in Naples, and the picture represents not the Ludovisi but the Farnese Hera. And we note in the very full list of contemporary American sculptors who are thought worthy of mention, one omission too important to be passed over, that of the name of Edward C. Potter, whose splendid animals at Chicago and elsewhere certainly entitle him to a place among the most able of those who are included.

'The Student's Companion to Latin Authors,' by George Middleton and T. R. Mills (Macmillan Co.), is an excellent little octavo of 375 pages. Its object is "to give in a convenient form all the facts of importance relating to the lives and works of the principal Latin authors, with full quotations of original authorities on all the chief points." It is not intended to take the place of a history of literature, and hence critical appreciation of the classic writings does not enter into its plan. It will be a useful supplement, therefore, to such books as Crutwell's or Mackail's histories of Roman literature, for in them exact information about the lives of the authors and the contents of their works is sacrificed to the demand for æsthetic judgments. The authors included are those generally read in schools and colleges, from Livius Andronicus to Suetonius. The work is well done, and the book, which fills a real gap, will be invaluable in every public or private reference library.

The first part of Mr. A. W. Quill's translation of the 'Histories' of Tacitus, published in 1894, met with but an indifferent reception. In the endeavor to convey to English readers a vivid idea of the style of Tacitus, as well as of his meaning, Mr. Quill often sacrificed the actual sense of a passage for the sake of brilliant epigram or striking contrast. There was, too, an unpleasant flavor of modern colloquialism, not to say slang, in much of his work. Yet, in spite of this, it was clear that the translator came to his task well prepared by previous study, and that he was thoroughly imbued with the spirit of his great original. And in the second and final volume (Longmans) it is evident that Mr. Quill has profited much by the criticisms which were passed upon his first. It is a pity that we cannot hope for a revision of the earlier volume. While the present can by no means be considered the final translation of the 'Histories,' yet it is as good as any which has appeared, and many of the notes with which it abounds will be useful to students.

The Annals of the Astronomical Observatory of Harvard College, vol. xxx., part iv., contain a discussion by H. H. Clayton of the cloud observations made at the Blue Hill (Mass.) Meteorological Observatory, founded and maintained by A. Lawrence Rotch. The discussion forms a volume of 500 pages and 16 plates, and must be regarded as by far the most thorough study of the kind ever undertaken in this country, if not in the world. It is admirable in the truly scientific spirit of investigation that prevails from beginning to end. The nomenclature of clouds is thoroughly discussed at the outset. Successive chapters then deal with the annual and diurnal periods in the amount of cloud; relations of clouds to rainfall; relation of clouds to cyclones and anti cyclones; methods and causes of cloud formation; various relations of cloud and winds; and finally the use of cloud observations in weather-forecasting. Mr. Clayton's results not only take a leading place in meteorological science, but set the standard towards which all similar work must for years to come be content to strive. The country is fortunate in having Mr. Rotch as a patron of meteorological science, and he is fortunate in having Mr. Clayton to carry out his excellent plans to well-ordered execution. The Metropolitan Park Commissioners show their appreciation of the observatory by granting it a reservation in the midst of the extensive Blue Hill Park.

Two important publications have lately been issued by the U. S. Geological Survey. One is Bulletin 127, a 'Catalogue and Index of Contributions to North American Geology, 1732-1891,' by N. H. Darton; an octavo volume of 1,045 pages. The entries include a complete bibliographic list of articles under authors' names, and analytical lists under localities by States, under formations by physiographic regions, and under a partial classification of "geologic philosophy" in which the alphabetical order of headings is, for some unstated reason, abandoned. Under each subdivision, the order of entries is by date of publication; but, under each year, titles often stand in accidental order, and this involves some inconvenience in such a subject as petrography, where the titles of a single year overrun a page column. Full references to place of publication are given only under the author's name. With so many leading lines it is very easy to run down any desired subject. Florida coral reefs, for example, will be found under Florida; under Pleistocene formation, Gulf region; under geologic philosophy, section coral reefs; and under various authors. Errors appear to be very rare, although one well-known name is repeatedly misprinted.

Folio 30 of the Geologic Atlas of the United States includes the Yellowstone National Park, and is most elaborate in text, illustration, and mapping. The text, by Hague, Weed, and Iddings, gives a condensed account of the formations represented, among which the volcanic lava sheets and breccias are most abundant and remarkable. The illustrations include admirable reproductions from photographs of the Yellowstone cañon; two fine specimens of petrified trees, standing; a beautiful view of Minerva terrace, Mammoth Hot Springs; and a grand boulder of granite, transported by ice from the snowy range to the lava beds in which the cañon is cut. The topography is shown on four contour-line maps on a scale of two miles to an inch; the chief features being the lava plateaus (more or less dissected), the lakes, and the cañons. The marshy floor of Two-Ocean Pass lies a little south of the Park on the southeastern sheet. The geological sheets are, like all the others of the series, beautiful specimens of lithographic art applied to national scientific investigation—a combination of which all American geologists may well feel proud.

In these days of "greater" cities which threaten merely to become "baser," it is refreshing to read the fourth annual report of the Metropolitan Park Commission of Massachusetts. This unsalaried body is charged with providing open spaces for public health and recreation in a territory having a radius of twelve miles from the Boston State house, and embracing thirty-seven cities and towns. The unrivalled position of Boston makes the working out of this problem a school for all other municipalities having a like end in view. The present report, which is, as usual, accompanied by scenic illustrations, diagrams, and maps, is notable for its consideration of the equitable balance of pleasure grounds in the area under treatment; its proposed conversion of the western part of the Charles River into a boating basin with a permanent level; and its quite novel study of the possibilities of Revere Beach. Here the landscape architect seeks to preserve unobstructed the beautiful sweep of the beach while affording the necessary accommodations for bathers and other visitors. We regret that we can do no more than suggest the extreme interest of this report.

The last few numbers of the *Archivio Storico dell' Arte Italiana* contain a series of articles by Signor Gustavo Frizzoni in review of Mr. Berenson's 'Lorenzo Lotto.' The discussion is so extensive as to rival the original volume in bulk. Signor Frizzoni goes over every point made by Mr. Berenson, seldom finding occasion to disagree with the latter's conclusions—indeed, not once on any matter of importance. To the English reader these articles will prove of value for the slight additions supplied by the reviewer (partly as communications from the author) to the list of Lotto's works, but chiefly for the numerous illustrations, seldom repeating those in Mr. Berenson's volume.

With the exception of some of our own institutions, the University of Helsingfors has the largest proportional number of women students of any college in the world. There are, at present, 211 women entered at the Finnish university, or 10 per cent. of the total enrolment. These are divided among the different faculties as follows: 79 in the physical-mathematical, 117 in the historical-philological, 8 in the legal, and 57 in the medical.

The Baltimore Association for the Promotion of the University Education of Women begins its work by presenting to the President and Board of Trustees of the Johns Hopkins University a brief petition, which requests this distinguished American institution of learning, "in view of the conditions existing at the present time, to open its graduate courses to those women who are qualified to pursue them." The petition, signed by a dozen or more representative and conservative women citizens of Baltimore, urges Johns Hopkins to follow the example of prominent universities in all parts of the world, and expresses the belief that the admission of women to the graduate departments of Johns Hopkins will further the special needs of the University itself, while advancing the general cause of education and culture. At the meetings which preceded the formation of the Association, the advisability of a separate woman's department of the University, or any willingness on the part of the Association to coöperate with the University authorities in organizing an "annex," was unanimously voted down. The friends of higher education will await with interest the decision of the Johns Hopkins trustees, who have now presented to them the opportunity graciously to yield to the claims of logic and of justice, by extending to other classes of women graduate students the advantages which they have for three years offered to women medical students.

—In the *Atlantic* for February, an article on "Village Improvement Societies," by Mary Caroline Robbins, calls attention to an "institution" which has become established within the last fifty years, and which presents several points of interest. A Village Improvement Society may be described as a volunteer organization to attend to public matters which the public authorities generally neglect. It plants trees, makes the streets and sidewalks neat, keeps its eye on drainage, and in general looks out for the care and ornamentation of the village. It seems to be mainly a matter of interest to the women of the village, and the writer declares that village improvement first began in this country in 1853, when the Laurel Hill Association of Stockbridge was founded by Miss Mary Hopkins, afterwards Mrs. Goodrich. Going further back, she finds a forerunner of Miss Hopkins in Maria Edgeworth, who in 1831 devoted herself to the same cause in Edgeworthtown. One thing which has tended to foster village improvement has been the "presence of summer visitors and residents," who bring with them an unwillingness to submit to the original village standard of civilization, and it appears that more than sixty towns in Massachusetts have established societies, though some of them have not been maintained, and among the results of the movement noticed in various communities are smooth, well-kept, and well-shaded walks, improved buildings and grounds, diminution of the nuisance of advertisements on rocks and fences, improved drainage, the opening of new paths, and the removal of rubbish and care of cemeteries. In all the cases enumerated, though the method employed has been that of associated or corporate action, the societies have been organized and the work done by one or two persons, as in the case of all other reforms. The activity of women in the matter has been very striking, and deserves attention because it is no doubt related to the activity of women in certain directions in public affairs in the cities. No mention is made of the case of Ashfield, where remarkable results have been produced, chiefly by the efforts of Prof. C. E. Norton and G. W. Curtis, commemorated in an annual village dinner, the speeches at which attract wide attention. The whole subject is one of considerable interest to any student of democratic life and customs.

—Mr. Henry Cabot Lodge has an article in *Scribner's* on "The Last Plantagenet," in which he reviews the researches of several modern scholars, and undertakes to give an accurate historical picture of Richard III. The crook-backed villain and tyrant whom we all know in the play becomes, in the course of the essay, an erect, well-favored, far-sighted statesman, who, if the list of reforms and improvements introduced by him is somewhat meagre, would have left behind him a record for all to envy had he been allowed to live a little longer. Mr. Lodge admits that Richard was "indifferent to human life, bloodthirsty and cruel," but we must remember that he lived in a society (that of England in the latter half of the fifteenth century) whose views as to the sacredness of human life, and as to murder, treachery, and the like, "were those of North American Indians." We are to remember also that he murdered only the nobility and gentry, who took precisely his view of moral questions. Nor is it to be overlooked that "the ability of the man, his greatness as a soldier, his wisdom as a statesman" were "his alone, while his crimes and his overmastering ambition, although his own, too, were also the offspring of his times, of which he, like other men, was the child and prototype." That is, we must credit a man with all the good that there is in him, but attribute his crimes to his period. This theory has never been advanced so baldly before, and, as stated by the learned essayist, would be enough to make a North American Indian laugh. The article ought to be looked into carefully by Mr. Gairdner, who, according to Mr. Lodge, having undertaken, and failed, to sustain the traditional and Shaksperian view, has paved the way for the present impartial and original review. Mr. Lodge, among other novel and important remarks, states that, since the death of Richard, the English monarchy has been growing more and more "bourgeoise." Alas for the good old times. Another article, on "A Great Hotel," by Jesse Lynch Williams, gives a mass of

curious information, accompanied by illustrations, relating to the American hotel as it exists to day. The article notices the fact that some "guests" would like more privacy and comfort and less display, but his answer is the usual one, that they are a minority, and that probably the average guest gets what he wanted. So the minority go off to Europe to travel.

—The chief illustrated articles in *Harper's* are by Richard Harding Davis (on the coronation of the Czar), Charles F. Lummis (on the "Awakening of a Nation," *i. e.*, Mexico), Richard Wheatley (on "Hygeia in Manhattan"), and Poulteney Bigelow (on the President of Orange Free State—Part iv. of his "White Man's Africa"). Mr. Lummis, who speaks of Mexico from long acquaintance, declares the development of Mexico under Diaz, now President for some twenty years, to be "as wonderful as sudden." Brigandage has been suppressed, and life, property, and human rights "are more secure than even with us." As for stability, Mexico had, until the present era began, fifty-two executives of different kinds in fifty-nine years. Seven thousand miles of railway have been built and a network of telegraph lines, while a complete school system of a very thorough sort has been established. The consular and diplomatic service is far superior to ours. Finally, if we may trust Mr. Lummis, free speech and a free press exist, and corrupt administration of the various States has been stamped out. This is really the description of a free country, but Mr. Lummis calls the Government a "logical paternalism," and what we know of the Spanish-American world would lead us to question the practicability of asserting, even under Diaz, rights *against* the Government, and most of all to wonder (as the Mexicans themselves do) what will happen after Diaz goes. If he disappears and a stable political and social order endures, the crisis will have been passed, and a respectable modern state will have been proved to exist.

—Capt. Mahan contributes to the *Century* an authoritative discussion of the battle of Copenhagen; and, among other papers of interest, the Recollections of Samuel Lover, by his daughter, and "In the Desert with the Bedouin," by R. Talbot Kelly, and "An Inland Venice" (the Spreewald), by Charles de Kay, are most noticeable. All of these are illustrated, as is also Mrs. Van Rensselaer's "Places in New York," in which case, however, we do not find the illustrations specially typical of the "union of individuality and heterogeneousness," which the author sets down as making its character. The Grotesque should not be forgotten, and there are much more wonderful effects of high buildings and elevated roads to be seen than any depicted here. A view of the city as it appears from the deck of a Staten Island ferryboat is something to remember, and, as Baedeker would say, the elevated-railroad elevators should not be overlooked by the visitor. We should also insist on Monotony and Squalor having their share in any complete typification of the city, and would suggest Harlem Flats as illustrating the former. But then we love realism; and so, by the way, does Mr. Stephen Crane, who, in his short story, "A Man and Some Others," has turned his attention to blackguard humanity as it appears in southwestern Texas. He gives, very neatly, a characterization of a peculiar quality of his own writing when he talks of "the inconsequence of human tragedy." That is what is always in his mind, and it is a new idea in our literature. What used to fill people's minds was the significance and epic character of life and death; what delights him with realism is that it can be used not only to vulgarize romance, but to make tragedy "inconsequential." That is, he can get rid of morality and purpose altogether, and write about human beings in a kind of artistic vacuum, in which nothing has any meaning whatever. In vivid contrast to this point of view is Mr. Stillman's pathetic "true history" of two pet squirrels, "Billy and Hans."

—The report of the Maine Superintendent of Common Schools for 1896, recently issued, is a document of more than ordinary interest. Instead of filling his pages with discussions of "educational values," "psychology for teachers," and the "enrichment" of the course of study, Mr. Stetson presents further results of an investigation of the actual condition of the common schools of the State, some account of which was given in his report for 1895. From information furnished by 513 superintendents of schools in towns and cities, it appears that only 21 per cent. of the superintendents are themselves teachers, and that but 4 per cent. devote their entire time to the duties of their office. Sixteen per cent. state that they have had only a common-school education, and 4 per cent. that they have never attended school, while 35 per cent. have had no practical experience as teachers. Twenty two per cent of the school-houses are reported as in "poor" condition, 52 per cent. as "fair," and 20 per cent. as "excellent." The condition of out-buildings, including many reported as "excellent," is deplorable. While 71 per cent. of the teachers are legal residents of the towns in which they teach, 17 per cent. sustain such family or business relations to the superintendents as to give them a marked advantage in obtaining positions. It is not surprising, therefore, to learn that only 38 per cent. of the teachers have taken the examinations prescribed by State law. As to length of service, 67 per cent. have taught but one year, or less, in their present schools, and 27 per cent. have taught altogether for no longer period. That the local superintendents are not wholly indifferent to the condition of both schools and teachers is shown by the fact that 75 per cent. of them approve the scheme of a State Board of Examiners, the creation of which is being urged upon the Legislature. Of the $1,638,598 available for the support of schools in 1896, $515,742 came from the State Treasury. The report has been widely called for and, naturally enough, has evoked some hostile criticism; but there appears to be a greater disposition than for some years past to consider proposed reforms, and to make the schools of the State, what they at present are not, both efficient and economical. It would be interesting to know in how many States an equally thorough investigation of the common schools would show the prevalence of better conditions.

—The heated controversy now occupying German parliaments and newspapers as to the ethics of duelling has given occasion to quite a little "literature." Two pamphlets, "Das Duell und der germanische Ehrbegriff," and "Das Duell in Deutschland" (Kassel: Brunnemann), by Dr. Georg von Below, the well-known professor at Münster, deserve to be noticed, even outside Germany, as distinct contributions to the history of social manners. Dr. von Below goes the right way to work for his immediate purpose, in maintaining that there is nothing peculiarly German about the duel; that it has not been developed on German soil either out of trial by battle, or private warfare, or the tournament, but that it is a "Romance" institution, "a Spanish-Italian-French" sickness, which entered the fatherland from outside in the second half of the sixteenth century. Appeals to the "primitive German" have often done so much mischief that it is to be hoped that they will be listened to now that they are for once on the side of common sense. Men who are brought officially into contact with the compulsory duel still maintained by the military authorities, need so much moral courage to express their disapprobation that they deserve all honor and respect; and it is a duty, therefore, to mention the noteworthy case of Pastor Schräder and the clergy around Bremerhafen. Pastor Schräder, of a village near Geestemünde, was called upon as a military chaplain to conduct the funeral services over the captain of a corvette who had fallen in a duel. He felt bound to declare decisively and earnestly that duelling and Christianity are incompatible; whereupon the military authorities withdrew from him "the military cure of souls"—or, as perhaps it ought to be translated, "the cure of military souls"! The rest of the story is even more cheering. None of the clergy in Geestemünde or Bremerhafen would consent, under these circumstances, to accept the office, and the military authorities found themselves compelled to ask Pastor Schräder to resume his charge.

—In an octavo pamphlet of ninety pages M. Hugo P. Thieme has undertaken to give, under the title 'La Littérature française du dix-neuvième Siècle' (Paris: H. Welter), a bibliography of the principal prose-writers, poets, dramatic authors, and critics. The contract is undoubtedly a large one, and that Mr. Thieme should have had the courage to attempt so serious a task is to his credit. But whether he was wise in publishing the result of his work in its present state, is a question which it is not easy to answer in the affirmative. Even a cursory glance reveals many deficiencies, and not minor ones, either. Taking Balzac, for instance, there is no mention of the date of publication of the separate works, nor, in the absence of such mention, any reference to Lovenjoul's masterly bibliography, save under "Références," where there is no indication of the nature of the work. Marcel Barrière's 'L'Oeuvre de H. de Balzac' is not given, neither is Flat, Biré, Moore. The 'Répertoire de la Comédie Humaine' is credited to Cerfberr alone, Christophe's name being omitted. Under Guizot, neither Chambrun nor Crozals is named. The omissions in the Hugo bibliography are not inferior. Baudelaire's pages in 'L'Art Romantique,' and his study prefixed to the selections in Crépet, are both ignored. So Bourget, Des Essarts, De Laprade, Morel-Fatio, and John Morley. There is no intimation that Banville's 'Petit Traité de Versification Française' is practically devoted to a study of Hugo as a verse-writer; it is not named under this rubric. Marzial's book is also omitted, though the bibliography which it contains alone entitles it to mention. Monod's 'Les Maîtres de l'histoire' is cited under Taine, but not under Michelet or Renan. Although Byvanck has given us one of the best books on the Décadents and the Symbolists, he is not referred to at all under Mallarmé, Moréas, or Verlaine. The references to periodical literature are equally incomplete and unsatisfactory. M.

Thieme does not appear to have met with the *Revue de Paris*, which is not included in his list of periodicals, though it is here and there referred to, nor to be aware of the existence of the *Revue Blanche*, the *Revue d'Art Dramatique*, *La Critique*, the *Zeitschrift für Französische Sprache und Litteratur*, or the newspaper, *Le Temps*, in which Sarcey's dramatic criticisms have so long been published and are still being published. The work is very imperfect, and it is a pity that the author yielded to the entreaties of his friends that he should publish it before having at least revised it with some care, and made tolerably certain that he had included well-known references. The proof-reading has been very carelessly done, and the alphabetical disarrangement is not conducive to facility of reference. Economy is carried too far when both pages of the cover have to be utilized for matter which ought to be found within the covers. If M. Thieme will make of his present publication the basis of a more thorough and accurate work, he will earn the hearty thanks of students of nineteenth-century literature. The imperfection of his present effort ought to stimulate him to make a really valuable contribution to bibliography.

POLITICAL SCIENCE AT BRYN MAWR.

The Nicaragua Canal and the Monroe Doctrine: A Political History of Isthmus Transit, with special reference to the Nicaragua Canal project and the attitude of the United States Government thereto. By Lindley Miller Keasbey. G. P. Putnam's Sons. 1896.

Mr. Keasbey is associate professor of political science at Bryn Mawr College. In a volume of six hundred pages, nine tenths of which is historical, he gives a narrative account of the various dreams, schemes, plans, expeditions, explorations, and enterprises of four centuries, relating to a commercial route across the isthmus, the only important result of which, thus far, has been the Panama Railway. This sketch includes and is in great part made up of an account of the diplomatic negotiations and treaties between the countries chiefly interested, and especially of the Clayton Bulwer treaty. There is also a considerable collection of facts relating to the commercial aspect of the question, designed to prove, what we believe has never been questioned by anybody, that a canal across the isthmus would be a very important commercial work. Oddly enough (in a book written in the interest of the Nicaragua route), the author seems to admit that the question whether the Panama sea-level canal or the Nicaragua lock-canal is the better route, is, as a "technical" question, still open (p. 16); but as he says (p. 17) "the aim of this book is political," and as this political aim is to show that the control of the transit is a vital matter for the United States, his views would seem to apply with equal force to any canal, no matter through what country it may run nor what it may cost. Indeed, they would apply to the proposed Tehuantepec ship-railway, for this, once built, might be used to bring over the whole British navy (striking at us, as Prof. Keasbey would say, through the Suez Canal), and lay it down in the Gulf, ready for action at our very doors.

As an historian, Mr. Keasbey hardly seems destined to attain a very high rank. His work is the result of painstaking industry, unaided, however, by any power of arrangement, the result being rather a disorderly heap of materials than a coherent analysis of the march of events. The book is consequently rather difficult reading; and the difficulty produced by lack of literary skill is increased by the mistaken efforts of the author to evolve order from confusion by an artificial arrangement not based on facts, but introduced to support a preconceived theory, representing the isthmus as the theatre of a titanic struggle between England and the United States for the control of the key to the Western Hemisphere, if not to the commerce of the world. Unfortunately, the facts recorded by the author, from the downfall of Spain and the mercantile system, fail to show any continuous policy on the subject in any country, while they do show beyond question that the only country which now contains any body of persons demanding the exclusive control of the isthmus and talking as if a titanic struggle for it were contemplated, is neither England nor France, but the United States, although, as the author very clearly shows, we are "estopped," or, in plain English, bound by our own promises, not to engage in any struggle, nor to demand any exclusive control.

Yes, the collection of facts made by Mr. Keasbey not only does not support, but disproves, and even renders absurd the conclusions which he undertakes to draw. One of the curious facts in the history of the project, recalled and made plainer than ever by this author, is that we really were, at one time, not so very long ago, threatened by an enemy on the isthmus—a foreign enemy engaged in carrying out a political plot hostile to our interests. In 1846 a pamphlet was published in London on the canal question by an unknown writer, who called himself "N. L. B.," and who, after likening the position of Nicaragua in the New World to that of Constantinople in the Old, pointed out that if the isthmus were cut through, that State, "destined to attain an extraordinary degree of prosperity and grandeur," "would command, by virtue of her central position, the entire coast of North and South America." He predicted that England would "see with pleasure" a powerful Central American State, capable, by "backing Mexico," of preventing "any further encroachments from the North," and declared that England had, "more than the other Powers, a political interest in the execution of this project" (p. 16). The enemy who actually appeared in Central America, however, was not England, but the author of this interesting prediction, engaged at the time of its publication in a conspiracy to verify it. Six years later, the pamphleteer had got possession of the Government of France by violence, and eighteen years later had established an Emperor in Mexico, and was sending out Michael Chevalier to "make sure of his rights in Nicaragua" (p. 293). The episode of the Mexican empire is rightly regarded now as having been a purely Napoleonic adventure, and we have never borne the French people any ill-will for it; but the historical fact remains that the only people against whose attempt to control the isthmus we have had to threaten force has been the French.

So long as the theories of the mercantile system lasted—that is, to the end of the Napoleonic wars, and the loss by Spain of her American colonies—outlying possessions on this side of the ocean were regarded as so much valuable property, to be "milked" by the home country, and as military or naval "keys." Such, in fact, in a military period, they really were. This was almost a necessary result, as the author seems to be aware, of the fact that national interests had been long identified with those of the reigning family (he calls the period one of Royal Monopoly); and that the aim of Government had been to regulate trade so as to bring in as much money as possible. Militarism was the groundwork of this system; domestic prosperity was conceived of as enjoyed, and was to a considerable extent enjoyed, at the expense of the rest of the world. While this system lasted, no doubt the control of the isthmus played a great part in all speculation as to the future of the western hemisphere. But with the appearance on the scene of the United States as a first class pacific Power, all this came to an end, and can never be brought back, because the ideas which underlay it have been outgrown. The modern Western world rests on individualism, free contract, and liberty, as distinguished from Governmental management, the two foremost Powers in the modern movement having been the United States and England. Since the present period has begun, England has had no more interest in aggrandizement on this side of the water than we have had in Europe. Her colonies here are notoriously of little or no value to her, as they tax themselves and make their own tariffs, while she is responsible for their defence.

This period the author rightly calls the period of liberalism and individual initiative. It is marked by the development of the United States as a great neutral and pacific Power, by the adoption of free trade by England, and, greater than all, by the introduction into common use of inventions and appliances which make the world commercially one, destroy time and space, efface political boundaries, and convert the earth into a great industrial machine, the interests of each part of which are identical with those of every other, and to which the termination of the general peaceful activity by war means ruin such as mankind has not known for centuries. It is a period in which peace has become a necessity. One of its most signal early triumphs was the ratification of the Clayton-Bulwer treaty in 1850, an agreement by which the two foremost commercial nations in the world mutually undertook that any isthmus canal which might be built to unite the Atlantic and Pacific Oceans, should be a guarantee of a more lasting and universal peace. For what the two nations promised each other was not simply that neither should ever obtain exclusive control of any ship canal, or fortify it against the other; by the eighth article of the treaty they agreed that they would, so far as possible, establish the principle of the neutralization of all routes for all time. Their object was avowedly "the benefit of mankind" (Art. vi.). And now we are told by the author of this volume that this period came to an end in 1865, and that we are living in a new era, in which the canal project is a "national undertaking."

What he means by this is that within the last thirty years a certain number of persons, of whom he is one, and who have mainly belonged to one party, have fostered a plan for tearing up the Clayton-Bulwer treaty, having the canal built by the United States, or under its direction, and then claiming it as part of the "coast-line" of this country (the phrase was a "happy thought" of Blaine's), and assuming exclusive control.

Over the Clayton Bulwer treaty it is not worth while to waste time, for the author does not seem to pretend that England is not in the right in insisting that it is in force,

The peculiarity of his position is that, like all those who have taken up the cudgels for exclusive control, he proposes that we should act as if the treaty did not exist. International law and the Constitution, which make treaties part of the supreme law of the land, Mr. Keasbey evidently regards as being subordinate to the Monroe Doctrine. The Frelinghuysen-Zavala compact with Nicaragua (p. 426), negotiated in 1884, represents his ideal, and this provided for national ownership of the canal and a protectorate over Nicaragua. It was never ratified, because, in 1885, Mr. Cleveland withdrew it from the consideration of the Senate on the ground that it was opposed to the traditional policy of the country. Had it been adopted, as it probably would have been had the Republican party remained in control, the issue as to the existence and binding force of the Clayton-Bulwer treaty would have been definitely presented.

Treaties generally remain in force until circumstances so change as to make them useless. Aware of this, Mr. Keasbey wishes to make it appear that something has taken place which makes it necessary for us to claim not merely that the treaty is outgrown, but that it follows from this that we must control the isthmus. For this purpose, however, he is obliged to resort to pure fancy. His first fancy is that England is longing for the exclusive control herself, when the fact is that she strenuously disclaims anything of the sort, and insists upon the Clayton-Bulwer treaty as preventing it (p. 412). His second is his "new period" of exclusive control; the fact being, not that any period of national control has begun, but that he and his friends want to establish this principle in defiance of the whole historical tradition of the country for three-quarters of a century. Finally, he brings forward his great discovery that the Clayton-Bulwer treaty is in conflict with the Monroe Doctrine, the fact being that, but for the existence of the treaty, England would have been entirely at liberty to deal with any Central American state as she pleased. This is the point which the victims of the Monroe craze never fail to miss. If the Clayton Bulwer treaty were cancelled to-morrow by consent of both parties, England would be at liberty to do anything that the treaty prevents her doing; and the theory of the author is that she is herself longing for the exclusive control of the isthmus. But with the treaty out of the way, what would prevent her getting exclusive control? The Monroe Doctrine, and that alone. But the doctrine has no force except so far as it may be backed up by a threat of war. The argument, therefore, comes to this, that the assertion of a claim to exclusive control of a canal through territory over which we have no jurisdiction, at the risk of a war with our most dangerous rival, is better than a perpetual joint guarantee of peace. The argument could have no meaning except for conspirators bent on changing the policy of the United States from that of a great pacific, industrial, and neutral state into a belligerent military Power. That there are men at Washington quite ready to become the beneficiaries of such a conspiracy, there is ample proof.

Chapter xxiv. is a grotesque summary of the author's views. This continent, he declares, is "to be reserved for the exclusive enjoyment of its present inhabitants," and this position we are to vindicate by assuming exclusive control of any canal that may be built. The great law of life is the survival of the fittest (p. 558), and we are the fittest. The designs of England are opposed in the East by Russia, while on the West "the United States dispute her further advances," and "conflict is consequently imminent". (p. 568). "The ideas of the American people are rapidly reverting to militarism" because "Canada blocks the way on the north," and "to the south the people are held in check by treaty obligations with a friendly state" (p. 571). We need the canal in order to be able to annex Hawaii, which is described as among our "littoral islands" (pp. 571-2). Arbitration is out of the question "because the American Monroe Doctrine is by no means so well established in the world as is the British imperial system," and we could "hardly expect any European arbiter to appreciate the justice of our present claims" (p. 587). Besides this the question is one of "national integrity" (p. 588). "For the present," Great Britain will continue to "work out her present imperial plans," and we must consequently "look for sympathy" "among her other competitors" (p. 592)—that is to say, to Russia, which has no interest in opposing the Monroe Doctrine, and with whose designs in the East the United States are "in no wise concerned" (p. 593). But if we prefer to "continue the contest single-handed," we must "round out our southern frontier" by constructing the Nicaragua Canal. As the Clayton-Bulwer treaty stands in the way, the author's final conclusion is that we had better "allow the treaty to stand for the present," but build the canal, and then, provided it is built with American capital, we can "assuredly control and defend" it, "despite international provisions to the contrary" (p. 597). That is, let us build the canal under the treaty, and then tear the treaty up, and fortify the canal against the world. Such a rigmarole as this cannot be seriously discussed.

"OUR DOLOMITES."

Through the Dolomites from Venice to Toblach: A Practical, Historical, and Descriptive Guide-Book to the Scotland of Italy. By Alexander Robertson, D.D. With forty-two full-page illustrations and map. London: George Allen; New York: Scribners. 1896. Pp. xii, 232.

To the true Dolomite-lover a new book on his favorite region is a cause of apprehension; he is satisfied with no half-way praises, no admissions that the Dolomites are splendid mountains of their kind; he expects them to be so clearly set forth that no reader can miss the just belief that they are of a kind unapproachable. His Pelmo, Fünffingerspitze, and the Drei Zinnen are to be compared only with Whymper's Matterhorn or Conway's Golden Throne. For a guide-book the imperishable Baedeker suffices, and there are already too many gossiping books of travel written by people who can laugh under the shadow of the Cimon della Pala. What is to be expected of a new book which, in its title-page, calls the most glorious part of the Alps "the Scotland of Italy"! As well talk of the "Tierra del Fuego of Sicily," or of "Saxon Switzerland." Scotland is a respectable mountainous country, with its own beauties and its own grandeur, but it is simply incommensurate with the Dolomites; the two cannot be described within the same book covers.

These natural apprehensions are dispelled as soon as we open the attractive and handsomely printed little volume of Dr. Robertson. Having paid the highest compliment to his native country by likening it to the Dolomites, he drops the comparison, and betakes himself to the making of a book which, so far as our acquaintance with the literature goes, is altogether the best upon its subject in any language. Though called a "guide-book," it attempts none of the posting, lodging, path-finding and purchasing functions which are so well performed by Baedeker's 'Eastern Alps.' Nor does Dr. Robertson attempt the impossible task of dethroning Miss Edwards's 'Untrodden Peaks and Unfrequented Valleys' from its position as the classic book of travels in this region. Dr. Robertson supplies a third and equally important aid to the voyager or reader—a study of the history, architecture, art, and life of a region whose natural beauties are rivalled by the romance of its history. 'Through the Dolomites' is a companion for him who has had the happiness to spend days or weeks in the Piave valley; and it is the best of books for preliminary reading by him who has still before him the delight of a first visit.

To the historical accounts and allusions Dr. Robertson has given much well-bestowed thought; his eyes are open for those Roman remains which are found all the way from the *Via Pustumia*, near Treviso, through Feltre, Belluno, Castel Lavazzo, and Caralto, to the Roman bridge below Pieve di Cadore, and the site of the Roman castle above it. He even identifies Greek towns—Damos, Grea, and Gogna; but his evidence is not stated, and without decisive evidence one must doubt such bold conclusions on spots so far from the coast. Modern wars have studded these valleys with hotly contested battle fields: Rusecco in 1509, painted by Titian; battles of "the mountain troopers" (that is, rolling stones and logs) which swept away the Austrians at Riccorbo and Chiappuza in 1848 and at Tre Ponte in 1866. Dr. Robertson's earlier history is somewhat affected by an optimistic view of what constituted the "alliance" with Venice from 1420 to 1797, and he does not clearly state why, in 1463, "the Republic of Cadoro gave to the Republic of Venice the Bosco di San Marco." But it adds interest to the beautiful forests to know that the Venetian galleons and galleys which assaulted the Turks and carried the Crusaders came from the Dolomites.

To the search for and identification of pictures much attention is given in the book; and while there seems too much readiness to accept altar-pieces and frescoes as the work of Titian and his contemporaries, Dr. Robertson does point out many obscure and neglected pictures; of especial importance are the twelfth-century frescoes of the Gothic chapel of Salagona on "the Ridge of Gold," for the first time brought to the notice of English-speaking travellers.

Side by side with this erudition and spirit of research stands a very agreeable interest in the people and their life. The peasants of the Dolomites are a bold and hardy race, and the author brings out a certain stateliness in their buildings and their habits which is lacking in most parts of Switzerland. The "Biblioteca Cadorini" at the far-away village of Vigo is not an isolated example of the honorable custom of book-collecting. It was in Borca that there was gathered the splendid De Luca collection of Aldines, Comminianas, and manuscripts. At Belluno and Pieve are little museums. In Valle the author spent some time in a palace which he must have the credit of discovering, and there he unearthed a bit of decayed Venetian life. No English author has so lived among real, breathing Cadorini, and he had his reward: for him were opened the garrets full of for-

gotten furniture; to him the peasants brought bronze pots and carved chairs; to him the owners of the neglected palaces displayed their panelled wainscots and rich leather hangings.

By this association Dr. Robertson became heir to some lively country sayings which he has recorded. At Agordo he was told that "This is the only spot for water and for air; there's not another." At Perarolo the young women, stooping under burdens of wood and hay, say, "I have already taken the bend." The peasant woman at Damos "cannot dress her children with pomp." "The ground is always out walking here in winter," says an old peasant of San Martino. The life in these mountains is indeed hard. The timber industry (described in detail by Dr. Robertson) has for centuries been the chief source of income, and it is an interesting contrast with the ruder and more wasteful methods of American lumbermen; yet even in the Boite valley they cut too furiously. Dr. Robertson finds many cases of emigration to America, and discovers—what has escaped the notice of previous inquirers—that each village has a corresponding town in the United States, to which its emigrants regularly betake themselves. Another of the dangers and hardships is brought out with sorrowful distinctness: it is the "boas," the landslips. Of the dozen such "ruins" which are noted in the book, the most striking by far is the fall of 1771, which brought down a great slice of Monte Forca upon the doomed valley, and built a dike behind which backed up Alleghe Lake, four hundred feet deep. One characteristic of the region the author seems to have left altogether unnoticed, the jolly chimney corner, circling a detached hearth, which is adorned with the monumental bright iron fire-dogs of the country. Auronze and San Vito he has visited, but he knows not the snug warmth of the open hearths nor the smell of the bubbling stew.

To the scenery of the Dolomites the author pays due tribute, and he has enriched his book with more than forty beautiful half-tones, which go as far toward suggesting the splendors of the region as is possible for small black and white pictures. The reader has before his eyes the majestic forms of Civetta, Pelmo, and the Drei Zinnen (the author unjustifiably adheres to the far less striking name of the Tre Cime di Lavaredo), and the astounding mass of Cristallo, so perfectly reflected in the Dürrensee that the picture in the book may be literally turned upside down without disturbing its beauty or its truthfulness. But how present by photographs the faint pink of Civetta, the orange-tawny of Tofana, or the rose color of Croda di Lago?

To find flaws in a book which gives such pleasure of reminiscence and adds so much promise to "the next trip," would be ungenerous. Indeed, the errors of description are too few to be mentioned. Two general criticisms may, however, be made: one on the treatment, the other on the scope of the work. There is not a page too much of it on any subject; but there is too little upon the mountains, the traveller's Titanic friends and neighbors. The very names stir and arouse one, and sound like words from an heroic language: Lau, Sief, Cornon, Zumelles, Duran, Averau, Lares, Dubiea, Pismeda, Malcora, Digona, Promper, Mijion, Sforniai, Popena, Mojazza, Cridola, Tudaio, Crepedel, Pomagagnon, and the mighty brotherhood of Nuvalau, Tofana, Cristallo, Sorapiss, Pelmo, and Antelao. And yet these are friendly and hospitable giants. With all their majesty, Matterhorn, Weisshorn, Finsteraarhorn, and all the other wind-blown monarchs are German princes—haughty, cold, and unapproachable; the Dolomites have the Italian gentleman's softness and the Austrian count's *Gemüthlichkeit*. It cannot be that Dr. Robertson properly loves them, or he would make their individuality and prodigiousness stand out as clearly as he does his towns and his churches.

The other criticism is that the book covers only a part of the Dolomites—the two largest of the five north-and-south valleys. Cadore is not all, nor the most magnificent. The hurtling Cismone has gorges unapproached in the Pieve valley. Can Dr. Robertson not have seen Primiero, that he dismisses it with a mention? Has he ever stood in the Val di Pradidali, in the midst of the Pala di San Martino group? Has he crossed the Fedaja Pass or skirted the Langkofel and Rosengarten? Has he stood on the elephant-back of the Schlern? An author has no right to do a part of his work so well that the need of a like industry, truthfulness, and insight is doubly felt in the regions which he has not described. In thanking Dr. Robertson for giving us a fresh, helpful, and invigorating book on one of the noblest mountain regions in the world, is it too much to ask him for a companion volume on the rest of that famed land? For even his favorite Antelao is, as Miss Edwards's peasant said of another peak, "only one of our Dolomites."

Ranch Life and the Hunting-trail. By Theodore Roosevelt. The Century Co. 1896. Small 4to, pp. 187. Illustrated by Frederic Remington.

It is but a few years since the grassy plains west of the Mississippi Valley were occupied by the red man and the game on which he subsisted. Then the white hunters and trappers, backed by the railway and the soldier, began their work of destruction, and, by depriving the red man of his means of support, prepared him for control on the reservation. Myriads of skeletons over vast areas where, in the vengeful phrase of the pioneer, the good Indians are buried and the others dare not venture without a pass from the agent, recently marked the wasteful career of our hunters. Now even the Indian signs are growing scarce and faint; occasionally the traveller may find imprints of scattered lodges, or, by the stream upon the flats, the deeper traces of the village. The game is almost extinct, the robe-hunter has vanished, the savage dresses in cloth and sleeps in blankets. When the wild tribes were gathered in by the soldiers, the "cattlemen" were in waiting to restock the ranges. Each rushed forward as large a herd as he could secure for the best location, and strove to keep his neighbors as far off as possible, that he might have room for increase. Settled on the chosen grounds, he and his fellows combined for mutual interests and thus kept their holdings for a time. But they were mere squatters; the immense herds fed over Government lands, took care of themselves, and, if they managed to live through the winter, were rounded up once or twice in the summer for branding the calves and selecting the beeves. Homesteaders and surveyors then came to cut up the ranges and initiate different methods. A multitude of small herds could not be handled as a few large ones; there must be more constant supervision, and provision of food and shelter.

This book deals with temporary conditions; but they are well worth the record. The days of the "cattle kings," the "cowboys," and the great "roundups," as the author knew them, may be nearly over, but their story will not lose its interest. It marks a stage in the development of the country that cannot be ignored. There is probably no one better able to deal with the subject than Mr. Roosevelt. His sketches of the range, the herd, the cowboy, and the cattleman, of the ranch and the hardships and pleasures of ranch life, are drawn from personal experience and observation; and they are admirably done. They favor the ranchman somewhat in so forcibly setting forth the cruelty of climate and surroundings while dealing rather gently with that of the man who burns his brand into the flesh with the red iron and allows his helpless victims to freeze and starve on the blizzard-swept plain. The cowboys and cattlemen as seen in this work are true to life. They have many estimable traits; they are strong, self-reliant, manly, and well adapted to their vocation; and they will not disappear with change of conditions, as one might suppose. They will continue to be rough riders, but, becoming herdsmen in more constant watch of their bands, will to some extent approach the men on whom they now look down, the "sheep men," who spend their days and nights with the "woolly idiots" in their charge.

The cowboy from the Southwest brought with him a number of terms in the use of which our author is not entirely happy. "Chaperajos," in several places, should have been *Chaparejos*, or *chapparejos;* "the Spanish word lasso" should be *lázo;* "hackamore—a species of severe halter" is the Spanish *jáquima* (pr. háhkeemah), the headstall of a halter; and it may be suggested that possibly "Doughgies," a word which the author says he has never seen written, is the Spanish *dógos*, derisively applied to the young steers on account of their size; a *dógo* being a small dog. Mr. Roosevelt's observations on the natural history and the game of the region are thoroughly trustworthy, and consequently possess a considerable scientific importance. As adventures, the hunting experiences are not far above the average; for this reason they give a better impression of the chase than they would if more sensational. What is said of the Indian and the treatment to be accorded him is unusually just and considerate.

The volume is one of permanent value; it is effectively illustrated, and altogether is uncommonly interesting. As it first appeared, it was larger and more expensive; the present edition is the more convenient in size and price.

Richard Cobden and the Jubilee of Free Trade. London: T. Fisher Unwin. 1896.

Sir James Stephen said of Jeremy Bentham's books that many of them were like exploded bombs buried beneath the ruins of the abuses against which they were directed. Much the same must be said of the labors of any successful reformer. It is but a few years since the struggle for the abolition of slavery enlisted the hearts and minds of a number of noble men, but the attainment of their object necessarily resulted in their removal from the attention of mankind. Their work has passed into history; it and they belong now to the past and retain for this generation only an historical interest. So is it in modern England with Cobden and his mighty achievements. Few living men have any recollection of the era

of protection, and free trade has become so much a part of the nature of things that it would be unreasonable to expect men to dwell upon it with enthusiasm. The point of view changes; as we pass on, we look on a different side of reforms and improvements. Few people spend much time in considering the enormous gain from the introduction of railroads. They are occupied more in considering how they may be extended or in complaining of their abuses. There is perhaps more talk of late in England of the disadvantages of free trade than of its blessings. Hardly any one ventures to propose a return to protection—that would be too preposterous; but there have been suggestions of "fair trade," of retaliatory duties, of an imperial customs union, and other disguised forms of protection, and Lord Salisbury has intimated that free trade may have been somewhat hastily and improvidently adopted.

It is therefore not surprising that the "Jubilee of Free Trade" was not the occasion of any great popular demonstration in England. We must, however, confess to some surprise that the celebration of this jubilee by the Cobden Club was not more enthusiastic than it would appear to have been from the addresses collected in this volume. Mr. Henry Dunckley and Sir Charles Villiers spoke, indeed, with no faltering voices, and in Mr. Courtney there was no shadow of turning. But Mr. Dunckley and Sir Charles Villiers belong to a past age, and Mr. Courtney found no youthful supporters. M. Paul Leroy-Beaulieu furnished an appreciative estimate of Cobden's work, but he actually raised the question, "Is it certain that the work of Cobden is wholly and irreparably destroyed?" and went no further in his reply than to say that the force of his teaching and example, although weakened, "is not entirely exhausted." Dr. Theodor Barth endeavored to extract some encouragement for free-traders out of the course of economic policy in Germany, but his success was not brilliant. One cannot but wish that John Bright might have been spared for this occasion, or that Gladstone's vigor had remained a little longer unabated. Why should John Morley not have been heard from, who of all men should be able to speak with authority concerning Cobden? Surely the principles involved in the free-trade movement are of the utmost importance in these days. Protective duties are but one manifestation of the perversion of the power of government by special classes and interests, and even in England the cause of freedom demands incessant vigilance of its defenders.

The Year after the Armada; and Other Historical Studies. By Martin A. S. Hume, F.R. Hist. S. Macmillan Co. 1896.

WE welcome the appearance of Mr. Hume's historical essays for two particular reasons: first, because we cannot have too much information about that great flowering time of the Anglo-Saxon race, the reign of Queen Elizabeth; secondly, because Mr. Hume combines fulness of learning with lightness of touch. There are persons who turn to dust whatever they handle, even the heroic ages of the world. When a man submits to be the bond-servant of second-class Germans, he becomes an insufferable bore. Dr. Johnson once said of Goldsmith that he knew nothing; that he merely transplanted knowledge from one book to another. So it is with the army of colliers in the mine of commonplace monography. They are equally destitute of human interest and of power to make the past live again. They disdain style, and seek only to be correct and exhaustive. Let our young historians follow Mr. Hume's example, and try to produce sound history which at the same time will be accepted for publication in the *Gentleman's Magazine*.

'The Year after the Armada' is but the first of nine studies. Mr. Hume's work at the Record Office has brought him into close contact with the Spain of the Philips, and he throws heart into writing of what he has found among the rare publications and manuscripts of that period. Dons and swashbucklers, sea-captains and prelates troop through his pages in their fit characters, roaming up and down the western fringe of Europe to spin their plots and to wage their wars. Spain and England stand out in relief, not as types of ideas and institutions, but as persons and rivals. The pomp and finery of courts, the love of fighting, the daring, greed, and energy of a great age are all portrayed by Mr. Hume with truthful drawing and with warmth of color. His book is not one to be consulted, but to be read.

Mr. Hume begins with the attempt of an English joint-stock company to set Dom Antonio on the throne of Portugal in 1589. He has furbished up some Spanish and Portuguese manuscripts to supplement Record Office materials and adjust the point of view. Altogether they furnish him forth with a very pretty story of a huge fiasco. The inducements offered by the pretender were more attractive than the promises made by modern vendors of gold mines. Upon the reduction of Lisbon, Dom Antonio was "to hand to her Majesty the Queen, as an aid to the costs of the fleet, five millions in gold." He was to pay her annually 300,000 ducats in gold, delivered in London with carriage prepaid. He was to surrender seven Portuguese fortresses to England and pay the English garrisons sent to defend them. He was to fill all the bishoprics and archbishoprics of Portugal with English Catholics. Finally, he was to give every soldier fifteen months' pay, and the whole army permission to sack Lisbon for twelve days. No wonder that with these inducements 18,500 men were enlisted for the expedition. The Queen, in her usual thrifty way, managed to elude financial responsibility, while providing for her own profit in the event of success. Drake was one of the main promoters of the enterprise, and the Earl of Essex escaped from court to join him. Sir John Norris, who had served with credit in Ireland and the Low Countries, was taken along to command the troops. His force was identical in quality with the contingent led by Sir John Falstaff to the battle of Shrewsbury.

"The scum of the towns, the sweepings of the jails, were pressed for the voyage, and Pricket (or Wingfield), in his apology for the expedition, lays most of the blame of failure on the kind of men they had, and complains bitterly of the justices and majors sending them 'base, disordered persons, sent unto us as living at home without rule' . . . . Of the men at arms, all but the three or four thousand old soldiers, mostly from the Netherland wars, were idle vagabonds whose first idea was loot and whose last was fighting."

Yet so complete was the Spanish *débâcle* after 1588 that even this motley assortment of filibusters captured and occupied Corunna without difficulty.

The goal of the expedition was Lisbon, where disaffection towards Spain was supposed to be intense; but Fernando de Toledo arrived in time to save the town. Elizabeth became violently opposed to a project which detained Essex abroad, the Portuguese nobility refused to rally round Dom Antonio, and, on the 8th of June, Drake received on board at Cascaes the wreckage of a sordid host. The bubble was pricked within two months of the time when it was blown. Dom Antonio's claims "ended with the ignominious failure of the English attempt to avenge a great national injury by a joint-stock enterprise."

Of Mr. Hume's other essays—most of which have appeared in the *English Historical Review*, the *Fortnightly*, and the *Gentleman's Magazine*—the most valuable are "The Coming of Philip the Prudent," and "A Fight against Finery." One expects to find soundness of research at the Record Office. We hope that Mr. Hume's vivacity may also become endemic there.

On Many Seas. By Frederick Benton Williams. Edited by his friend William Stone Booth. Macmillan Co. 1897.

THIS is a notable book; a realistic record of cruel, bitter privations, hardships, and sufferings, and of man's brutality to man. How it came to be written is an interesting story. A part of the East Side House Settlement at the foot of East Seventy-sixth Street is the Webster Free Library, of which Mr. William S. Booth is librarian. Mr. Booth for several years followed the sea. Among the constant frequenters of the library was a man, now employed by the city in the capacity of steam engineer, who for fifteen years was also a sailor. On this account a friendship was established between the two, which led to a mutual exchange of nautical experiences. Mr. Booth was so impressed with the vivid, dramatic force and realism of his friend's narrations that he induced him to commit them to paper, promising to edit and prepare them for the press. The name of the author as printed is an assumed one; but such modesty was not called for in the case of so excellent a work.

He was born at Lovell, Maine, and in 1866, in his fourteenth year, determined to follow the sea as a profession. His first experience was gained in a coasting schooner sailing southward. In this vessel he had a preliminary taste of the brutal accompaniments of a seafaring life. For some slight indiscretion he was fearfully beaten by the entire crew, led by the first mate, and, had it not been that he was opportunely rescued by the captain, his career as a sailor had ended then and there. His second voyage was to China and Australia in a full-rigged ship, the *Tangore*. In a boat attack on a Chinese pirate junk he lost his forefinger and the end of his thumb. The *Tangore*, after loading wool in Australia, sailed for London, at which port Mr. Williams left her and shipped on an English ship bound for Cardiff to take in cargo. The vessel was wrecked on Land's End, whence he made his way to London, and joined a Welsh brig bound for St Lucia, West Indies. While in that port he took part in a mutiny and was promptly thrown into prison. Upon his release he shipped on an American barkentine for Philadelphia, and during the voyage he was attacked with malarial fever, to which it was supposed he had succumbed. Preparations were made to throw him overboard when, much to the regret of the mate, he exhibited signs of life and the funeral ceremonies were postponed. On the way home the provisions gave out, and all hands were reduced to the verge of starvation. The captain's wife, who, on leaving St.

Lucia, weighed 250 pounds, through lack of food was reduced to a mere skeleton when Delaware Breakwater was sighted.

At Philadelphia the author joined a Nova Scotia bark bound for Antwerp. He was almost without clothing. As he says, he made the voyage across northern latitudes in a naked condition. At Antwerp commenced his experiences in ships of varied nationalities. Twice he voyaged around Cape Horn, twice to Calcutta, to South America and the United States. He served as a sailor on a Chilian man-of-war; on a whaler, and on craft of all sizes and rigs. He never fails to record with bitter emphasis the cruelties inflicted upon the men by officers of the merchant marine. He gives in detail many instances, among them an account of his treatment by the captain of an English ship bound to London from Calcutta, when he was suffering from scurvy, and the horrible abuse of himself and other members of the newly shipped crew of an American cotton-ship from New Orleans to Havre.

There is no monotony or repetition in the incidents he describes, and he makes little use of those technical phrases which ordinarily render the reading of sea tales so wearisome to the landsman. No more powerful delineation of the terrors of the ocean was ever written than his story of the two months' struggle of a little brig against adverse gales off Cape Horn. On this occasion his ribs were broken. For twelve days that he lay in his bunk, with every roll of the vessel he could feel the movement of the loosened bones against his side. His sense of humor is somewhat grim. It is mainly employed in describing the intolerable meannesses of a captain or the brutality of a mate. In the chapter telling of the death by suicide of the captain of a German bark on which he was serving as sailor, he relates as follows the enshrouding of the deceased:

"We turned the sides of the canvas up, and ran a seam down in front, and then, setting the lantern on his breast, I, who was at his head and to windward, turned the flap up over his face and stitched it down, while the sailmaker did the same at his feet to leeward. Having stitched the flaps down all round, I said to the sailmaker, 'I'll just take a final stitch through the end of his nose, Sails, and then I'm done.' 'No, don't do dat,' said the sailmaker, and as he glanced up I saw, by the light of the lantern, that he looked white and nervous. 'Why, certainly,' said I, 'he'll feel slighted if we omit the final stitch,' and as I said it I jabbed the needle stoutly through his nasal organ."

The author makes no pretence to literary skill, and probably his narrative gains in force thereby. The editing by Mr. Booth is, as he says, confined principally to the elimination of yarns suitable only to the atmosphere of the forecastle.

History of English Literature. By Bernhard ten Brink. Vol. III. To the Accession of Elizabeth. Henry Holt & Co. 1896.

We have here the final volume of the English translation of Ten Brink's 'Geschichte der Englischen Literatur.' This corresponds to vol. ii., part ii., of the German (published in 1893), and brings the subject down to the death of Surrey. The great merits of the original work are so well known that it would be superfluous to insist on them here. We are compelled, however, to speak in somewhat emphatic terms of the fashion in which the present volume has been treated by the translator. Ten Brink's German is singularly clear, easy, and attractive; the English of the volume before us is confused, harsh, and repellent. It is a sin to put so badly written a book into the hands of students. But this is not the worst of the matter: the volume abounds in misrenderings, some of them of the most extraordinary sort. Five minutes' examination of any part of it will convince anybody that we are not exaggerating the translator's offences against both German and English, and—we must add—against common sense as well. A few specimens, however, must be quoted, if only in justification of the strong language we have been forced to use:

"Der Anonymus bezeichnet sich selber als 'armen Sünder'; einer seiner Abschreiber aber hatte den klugen und damals nicht ungewöhnlichen Gedanken, an seine Stelle eine Mehrheit von 'würdigen Gelehrten und Doctoren der Gottesgelahrtheit' treten zu lassen. Dem frommen Sünder kamen solche Prädicate kaum zu." P. 355.

"The anonymous writer calls himself a 'pore sinner'; one of his copyists, however, had the happy thought—not uncommon in those days—of entering instead a number of 'worthy scholars and doctors of divinity.' Such appellations would scarcely have suited the pious 'sinner.'" P. 5.

"Besonders häufig vernimmt man auf diesem Gebiet den Namen Guillaumes de Deguilleville, der uns zuerst in der Betrachtung von Chaucer's geistlicher Dichtung begegnet ist." P. 355.

"A name specially often met with in this domain is that of Guillaume de Deguileville, whom we first came across when discussing the religious bent of Chaucer's mind." P. 5.

"Je correcter er in seiner Gesinnung und seinen Ideen, je gleichmässiger er in der Durchführung seines Planes, je wählerischer er in seiner Diction erscheint, desto weniger," u. s. w. P. 356.

"The more correct he is in his sentiments and ideas, the more equal the construction of his plan, and the more choice his diction, the less," etc. P. 6.

"Laborirt er an Unsicherheit der metrischen Auffassung." P. 454.

"He laboured under the uncertainty of the metrical idea." P. 102.

"Und wenn schon die Alten in die Idylle gelegentlich eigene Erlebnisse und Anspielungen auf politische Tagesereignisse verwebt hatten, so sehen ihre italienischen Nachahmer hierin die eigentliche Bedeutung des Genres." P. 455.

"And even though the ancients occasionally introduced into the idyll, experiences of their own and allusions to political events of the day, their Italian imitators considered this the real character of the *genre*." P. 102.

"dem vermittelnden Hausirer." P. 490.

"the intermeddling Pedlar." P. 137.

"Der Wallfahrer hat somit die Wette gewonnen; doch erlässt er den besiegten Gegnern die Busse, die sie nur sehr widerwillig entrichtet hätten." P. 491.

"The Palmer thus wins the wager, and his vanquished opponents are offered an indulgence which they are rather unwilling to accept." P. 138.

"Abwechselnd werden ein paar Worte der einen und der andern vernehmlich; dazwischen fallen Schimpfworte, Streit- und Hohnreden, heftige Verwünschungen, welche die beiden Prediger austauschen." P. 492.

"First a few words of the one, then of the other is heard, in between the storm of abusive and spiteful language and vehement denunciations which the two preachers hurl at each other." P. 139.

"Es führt uns einen Pantoffelhelden vor, der während der Abwesenheit seiner Frau das grosse Wort führt, in ihrer Gegenwart sofort zu Kreuze kriecht." P. 492.

"This piece introduces a hen-pecked hero who, when his wife is absent, is fond of playing the bravado, but in her presence acts the humble." P. 140.

"Gattin und Gast . . . machen sich . . . beide davon. Hans dünkt sich etwas damit, dass er das Feld behauptet; doch da fällt ihm ein, der Rückzug des schnöden Paares könne eine andere, ihm selbst verhängnissvolle Bedeutung haben." Pp. 492, 493.

"Wife and guest . . . leave him to himself. Johan feels somewhat elated at being left master of the field; but it then strikes him that the return of the insolent couple might alter matters, and prove fatal to himself." P. 140.

"Dieser Erfolg gründet sich nicht etwa auf Neuheit des Inhalts der Handlung. Ein schwärmerisch verliebter und zugleich lüsterner Jüngling, der, um an das Ziel seiner Wünsche zu gelangen, sich an eine Kupplerin wendet; eine Jungfrau, die der vereinten Wirkung ihres heissen Blutes und teuflischer Verführungskünste nicht zu widerstehen vermag — derartiges hatte die mittellateinische Poesie und auch die Vulgärdichtung bereits geboten." Pp. 494, 495.

"This success was not the result of any novelty in the subject of the action, where a gay young man is madly in love, and, in order to gain possession of the object of his desire, consults a procuress, a woman unable to control the combined effects of her own hot blood and devilish seductive arts. Such subjects had already been treated by Mid-Latin poetry, and also by the poetry of the common people." P. 142.

"Henry Parker, Lord Morley, der in alten und neuen Poeten gründlich belesen war und Petrarca's Trionfi in englische Verse übertrug, welche, wenn auch nicht im Stile Wyatts, jedesfalls wohl gemeint waren." P. 591.

"Henry Parker, Lord Morley, who was thoroughly well read in the ancient as well as the later poets, and who had translated Petrarch's 'Trionfi' into English verse, and although not rendered in Wyatt's style, was at all events well intentioned." P. 237.

The importance of the book must serve as an apology for the space given to these specimens. It is to be wished that every person interested in English literature might read Ten Brink's 'History.' A good translation is, then, a great need. As for the present volume, it ought to be withdrawn from the market.

Walks in Florence and its Environs. By Susan and Joanna Horner. 2 vols., illustrated. London: Smith, Elder & Co.; New York: Charles Scribner's Sons.

It is with regret and sadness that we take hold of the Misses Horner's 'Walks in Florence,' unaccountably sent out for review fifteen whole years after the appearance of the last edition. It is ungrateful to criticise at this date a book written by passionate lovers of the subject, which served its purpose well in its time. But what has not changed since! The galleries have been rearranged, whole collections transferred; a new criticism has sprung up in the interval and been widely accepted; appreciations then whispered as paradoxes have had time to become commonplace. The book of the Misses Horner still has a value, but no longer as a guide, rather as an account of opinions and tastes prevalent fifteen years ago, and as a description of Florence as it was then—at its heart still the Florence of Dante and Michelangelo.

Hinc lacrymae; for it is no more that Florence of the past, that wonderful contrivance of the human spirit to supply the intramural lack of variety and interest of situation with the beauty of perspectives subtly changing from open to narrow spaces, and of exquisite detail intended to be seen at close range. Where is the Mercato Vecchio, with its sunny arcades; where the toppling Ghetto, even as a tower-crowned hill relieving the monotony of the plain; where that graceful arch through which you gazed at a transfigured Giotto's tower?

And what has taken the place of these? Broad spaces and desolate streets drawing attention to what the old builders were so careful to conceal, nay, to disguise, the dreary flatness of Florence this side the Arno. A piazza with mock giant arches and monstrous, misunderstood cornices, and an equestrian Victor Emanuel—a wax group in bronze—take the place of that Mercato Vecchio so mellow with the gold of matchless associations, refined enough for a Greek *lesche*. And Noah laid bare by his jeering sons was no more pathetic a sight than the back of S. Giovanni exposed in its insignificance. To crown all, a colossal tombstone of blinding white marble takes the place of that hope, that fount of charmed possibilities, the (alas) no longer lacking façade of S. Maria del Fiore.

To these manifold changes, all deplorable and few excusable, the Misses Horner conspicuously draw attention by the very absence in their book of any reference to them, for all have taken place since this was published. Only for the haunts of art and of beauty, outside the now desecrated town, left miraculously untouched by the Florentine of to-day, incapable of rivalling his ancestors, and bent, it would seem, on destroying every vestige of a hated superiority—only for such spots do the Misses Horner offer a guide still useful. The copious historical notices, it scarcely need be said, also retain their value.

BOOKS OF THE WEEK.

HAVE JUST PUBLISHED

TELEPATHY AND THE SUBLIMINAL SELF.

An Account of Recent Investigations Regarding Hypnotism, Automatism, Dreams, Phantasms, and Related Phenomena. By R. OSGOOD MASON, A.M., M.D., Fellow of the New York Academy of Medicine. With phototype from a Portrait made in a trance by a person who had never painted before. 12mo, $1 50.

A work that is accurate enough for scientists, and simple enough for lovers of "ghost stories." On a thread of theory and discussion Dr. Mason links many startling examples from his own professional experience and from the Proceedings of the Society for Psychical Research.

A DIPLOMAT IN LONDON (1871-1877).

Translated from the French of CHARLES GAVARD. 12mo, $1.25

M. Gavard left Paris in 1871, just before the entry of the Prussians. He was in the French Legation to the Court of St. James for seven years. He took part in many "functions," and visited many great houses, and his account of the every-day life of the English Aristocracy is most intimate, and brightened by humor and satire. He also met, among others, the Rothschilds, Gounod, the Empress of Germany, and the Czar. He writes much on Bismarck. He describes a meet, a coaching party, many receptions, dinners, and balls, a great fire, a sham battle, the dissolution of Parliament, the theatres the slums, the review of troops from Ashantee, Livingstone's funeral, Moody and Sankey, the Athenæum Club, Oxford, etc., etc.

SECOND EDITION OF

CUBA.

By A. S. ROWAN and M. M. RAMSAY. 16mo, $1.25.

Life and Letters of Oliver Wendell Holmes.

By JOHN T. MORSE, Jr., Editor of the "American Statesmen Series." With Portraits and other Illustrations. Two vols., crown 8vo, gilt top, $4.00.

"Mr. Morse has accomplished his work in a skilful and judicious manner. It will be a perpetual delight to the lovers of one of the most joyous of poets and the sweetest and most genial of men."—*Boston Transcript.*

Authors and Friends.

By Mrs. JAMES T. FIELDS. *Fifth thousand.* 12mo, artistically printed, $1.50.

A delightful book, containing reminiscences, anecdotes, and letters of Longfellow, Emerson, Holmes, Mrs. Thaxter, Mrs. Stowe, Whittier, Tennyson, and Lady Tennyson.

Joan of Arc.

By FRANCIS C. LOWELL. Crown 8vo, $2 00.

"The story is one of the most thrilling, pathetic, and pitiful in all history, and this without the legends which have gathered themselves about it. Mr. Lowell tells it in a manner and style which leave nothing to be desired."—*Boston Advertiser.*

Bayard Taylor.

By ALBERT H. SMYTH. In "American Men of Letters." With a Portrait. 16mo, gilt top, $1.25.

"In all the notable series of 'American Men of Letters' there is not one that can surpass in compact and animated completeness this biography of Bayard Taylor."—*Chicago Tribune.*

William Henry Seward.

By THORNTON K. LOTHROP. In the "American Statesmen Series." 16mo, $1 25.

"The public will be grateful for his conscientious efforts to write a popular vindication of one of the ablest, most brilliant, fascinating, energetic, ambitious, and patriotic men in American history."—*New York Evening Post.*

The Life of Thomas Hutchinson,

Last Royal Governor of Massachusetts Bay. By JAMES K. HOSMER. With Portrait and other Illustrations. 8vo, gilt top, $4 00.

"A work of first rate historical importance."—J. N. LARNED, *author of "History for Ready Reference.*

Whitman: A Study.

An entirely new, original, noteworthy book. By JOHN BURROUGHS. 16mo, $1.25. Also uniform with the limited Riverside Edition of Burroughs's writings, with a fine Portrait of Whitman. 12mo, gilt top, $1.50 *net.*

Sold by Booksellers. Sent, postpaid, by

HOUGHTON, MIFFLIN & CO., Boston.
11 East 17th Street, New York.

Books of Permanent Value

"Miniature Histories of the World To-day."

In the "Public Men of To-day" Series. Just Ready.

President Cleveland

By JAMES LOWRY WHITTLE. With two portraits. 12mo, cloth, $1.25.

"As a brief, comprehensive review of Mr. Cleveland's life and his public acts the book holds a reliable place, and can be commended as an interesting, readable production."—*Public Ledger,* Philadelphia.

Also Recently Published, Uniform.

Pope Leo XIII.

By JUSTIN MCCARTHY. With an interesting portrait. 12mo, cloth, $1.25.

*** This important work views the Pope from a distinctly *modern* point of view. Easily and gracefully written, in Mr. McCarthy's best style, the volume is eminently readable and instructive.

A New Book by Ascott R. Hope.

The Story of the Indian Mutiny.

With four illustrations. 12mo, cloth, $1.00.

*** The author introduces his subject with a brief outline of the history and peoples of India, their religions and customs, thereby leading up to the cause of the mutiny, with its horrors, heroism, and devotion.

A new novel by the author of "The Shuttle of Fate."

The Duchess Lass.

By CAROLINE MASTERS. With four page illustrations. 12mo, cloth, $1.25.

"Miss Masters," says *The Scotsman*, "is evidently at home in Lancashire. Her new novel is delightful, . . exhilarating in its freshness and vigor, healthy and homely in its theme, and singularly impressive in its pictures of life and scenes."

Heraldry: Ancient and Modern.

Including Boutell's Heraldry. Edited and revised, with additions, by S. T. AVELING. With 488 illustrations. Crown 8vo, cloth, $1.50.

An excellent elementary work on a very fascinating historical study.

John Ruskin, His Life and Teaching.

By J. MARSHALL MATHER. Fourth edition. 12mo, cloth, $1.00.

A simple outline of Ruskin's life and teaching, intended for those who purpose a detailed study of his writings.

A Book for Everybody.

The Dog: Its Varieties and Management in Health and Disease.

By STONEHENGE. Revised and brought up to the present date by GEORGE ARMATAGE. Illustrated with numerous engravings in the text and sixteen full-page plates of well-known and recent prize-winners. 256 pp. In 12mo, cloth, gilt, $1.00.

Treats of the points, varieties, breeding, training, and its diseases.

A Posthumous Work by the Late Davenport Adams.

Under Many Flags;

Or, Stories of the Scottish Adventurers. With page illustrations. 12mo, cloth, $1.00.

CONTENTS: Soldiers of Fortune in France—The Scots Guard—Sir John Hepburn—An Old Cavalier—Sir James Turner—General Patrick Gordon—The Founder of the Bank of England—John Law of Mississippi Fame—Two Famous Brothers, George and James Keith, Field-Marshals under Frederick the Great, etc.

*** It will be seen from the above list of contents that this is a work of unusual interest for young and old, the stories being told in the gifted author's well known and interesting style.

May be obtained from any bookseller, or will be sent, postpaid, on receipt of price by the publishers,

NOW READY.

THE EXPOSITOR

A Monthly Theological Journal.

English Edition Edited by
Rev. W. Robertson Nicoll, LL.D.

February Number.

DODD, MEAD & COMPANY announce the first number of the American Edition of *The Expositor* is now ready. This edition is under the editorial supervisian of the

REV. CHARLES CUTHBERT HALL, D.D.

(recently called to the Presidency of the Union Theological Seminary). As a magazine of scholarly theology it has for many years been known on the other side of the Atlantic, and it is believed that it will here meet a want and supply a growing need.

Single Copies, 25 Cents.
Annual Subscription, $3.00.

A Prospectus will be mailed on application.

Dodd, Mead & Company
PUBLISHERS,
149-151 Fifth Ave., New York City.

APPLETONS'

Popular Science Monthly.

FEBRUARY, 1897.

Herbert Spencer: The Man and his Work. Prof. W. H. HUDSON.

Explains the leading principles of Spencer's evolutionary philosophy, and tells how his great work has been carried through to completion.

The Racial Geography of Europe. Prof. WILLIAM Z. RIPLEY.

The first of a series of sociological articles. Shows why racial limits differ from national and linguistic boundaries.

Tendencies in Athletics for Women in Colleges and Universities. SOPHIA FOSTER RICHARDSON.

Shows how exercise, and especially earnestly played games, aid girls in their college work.

Indian Wampum Records. The late HORATIO HALE.

An account of the invention of making records by the patterns on wampum belts which is ascribed to Hiawatha.

Other articles on the Sphere of Taxation Peculiar to the Federal Government; Some Primitive Californians (illustrated); How Plants and Animals spend the Winter; The Interpretations of Automatism; The Scientific Work of W. D. Gunning (with Portrait); The Animate World a Unity; Condemnation of Criminals not Punishment; Plural States of Being; Sketch of Maria Mitchell (with Portrait).

50 cents a number; $5.00 a year.

D. APPLETON & CO., NEW YORK

Letters of Credit.

We buy and sell bills of exchange on and make Cable Transfers of money to Europe, Australia, and South Africa; also make collections and issue Commercial and Travellers' Credits, available in all parts of the world.

BROWN BROTHERS & CO.
NO 59 WALL STREET, NEW YORK.

CREST VIEW SANITARIUM,

Greenwich, Conn. An ideal home for health and recreation seekers. Beautiful scenery; very accessible; moderate rates. H. M. HITCHCOCK, M.D.

The Nation.

NEW YORK, THURSDAY, FEBRUARY 11, 1897.

The Week.

It appears that silver has something to do with the "hold-up" of the arbitration treaty in the Senate—how much, cannot be known at present. Why it should have any it is difficult to see, but the process seems to be something like this: Great Britain has the gold standard. It is a theory of the silverites that Great Britain is trying to force the gold standard upon us, using tremendous secret pressure through the Rothschilds and the Morgans. The arbitration treaty is popular among the gold-bugs in England and this country. Therefore it is an object of suspicion. Don't be in haste to ratify it. That some such feeling as this exists among the supporters of Bryan there is little doubt, yet it is not universal, as is shown by the action of the South Carolina and Alabama Legislatures, which voted unanimously in favor of the treaty. To all such persons we make the suggestion once more that the arbitration treaty had its beginning on this side of the water, and not on the other side. It took its first impulse in our own Congress. It is our doing. It was not enthusiastically welcomed by Lord Salisbury or by the party which he leads. There is no more connection between the treaty and the silver question than there is between it and the immigration question, probably less.

The Venezuelan boundary treaty, the text of which is now published, is in substantial accord with the reports previously published. The arbitrators are to be Lord Herschell and Sir Richard Collins on the part of Great Britain, and Chief-Justice Fuller and Justice Brewer of the United States Supreme Court on the part of Venezuela, with a fifth to be chosen by them, or, if they fail to choose one, then by the King of Sweden and Norway. They are to meet in Paris, or at such other place as they may choose, hear all arguments advanced on either side, and make a decision in writing within three months thereafter if practicable. Occupation for fifty years, either by settlement or by the exercise of political control, makes good title. All else is left to the judgment of the arbitrators. The Venezuelan Congress has still to pass upon the treaty, but there can be no doubt that it will be ratified at the coming session of that body. If they should reject it, they would never get any more Monroe Doctrine from us.

Senator Teller offered last week an amendment to the Nicaragua Canal bill providing that a new and complete survey be made under the direction of the President, and that no work be done or bonds issued until the survey is approved by him; and that if the survey shows that the cost of the work will exceed $150,000,000, nothing further shall be done without the authority of Congress. This amendment was accepted by Senator Morgan, evidently at the point of the bayonet, for the advocates of the bill a few days before declared that all such delays meant the death of the measure. Senator Aldrich in particular scouted the suggestion of Senator Sherman that the canal project be laid over temporarily, in order to find out exactly where we stand with respect to the Nicaraguan Government and to remove any obstacles found to exist there. The Teller amendment is a tardy and forced acknowledgment that the supporters of this bill were hopelessly in the wrong when they ignored the survey of the board of Government engineers, and insisted on going ahead in the face of that report, and without any survey from anybody else. The fact, alluded to in debate, that no complete survey had ever been made by anybody except that board, was as coolly ignored by the supporters of the bill as the letter of Minister Rodriguez informing them that the canal company had ceased to exist, and that it had no rights under the old contract, and that the United States Government could not acquire any rights under it even if the contract were still alive.

In his speech on the previous Monday Senator Vilas pointed out the fact that the first thing to be done under the bill is to pay the holders of the dead franchise the amount of money they have already spent in one way and another on the canal, not to exceed $4,500,000, "and the interest thereon." This payment is to be made in bonds of the company guaranteed by the Government of the United States. This sum of $4,500,000 is to be paid even if the franchise proves worthless. As Senator Vilas said:

> "Whatever becomes of all the rest of it, that section takes effect by the passage of the bill. We may never, if we should have a good board of directors, engage even in the construction of this already discredited route; we may never be able to realize the least particle of right under the concession of Nicaragua; but whatever we get or do not get, the stockholders of the Maritime Canal Company obtain $4,500,000 of bonds, and so much more as the interest on their expenditures amounts to up to the time."

They are to have also $7,000,000 of non-assessable capital stock by way of profit, but, of course, that will be worth nothing unless the canal is built, and may not be worth anything even then. The only reason, in Senator Vilas's judgment, why the United States should try to crawl into the skin of the corporation, whose concession will expire on April 27, instead of going to work in the direct way and opening negotiations with Nicaragua for a concession which shall not be liable to doubt and contention, is to have an excuse for paying this money to men who have been engaged in a bad speculation.

Senator Frye wants an item of $100,000 put in the sundry civil bill for the improvement of Pearl Harbor in Hawaii. It is not so much that he desires to have the harbor improved as to have the American Government perform "an act of sovereignty" in the islands. Under the treaty it is doubtful if we have any supreme rights in Pearl Harbor, but Mr. Frye would have the matter put beyond all question by our just going ahead and acting as if we were sovereign there. He thinks the present Hawaiian Government would not object to our appearing in Pearl Harbor in the rôle of a sovereign; but anyhow that wouldn't matter. The important thing is to "show clearly how far our jurisdiction extends." This is an elegant way of putting it, and it is a great pity that Walker, Capt. Kidd, the Dey of Algiers, and other filibusters and pirates had not learned, with the wise, to call their stealing conveying. All they ever intended was to perform with dignity like Senator Frye's "an act of sovereignty" in territory not their own, and to scuttle ships and hang men just to show clearly how far their jurisdiction extended. We have not much improved on their barbarous and lawless methods, but we infinitely surpass them in manners and in the art of using fine language to conceal or even adorn national crimes.

The controversy between the two branches of Congress over the immigration bill has ended in a victory for the House. The Senate made two radical changes in the original measure. One required that the applicant for admission must be able, not simply to read the English or some other language, but either English or the language of the country in which he has resided—a requirement which would shut out intelligent natives of one European country who had removed to another and had not acquired its language. The other change was a provision that a man able to pass the educational test might bring in a grandparent, but might not be accompanied by his wife if she were unable to read. Neither of these requirements could be defended, and there were suggestions that the President would veto the bill if they should remain features of it. The Senate has finally backed down, and an agreement has at length been reached. The original action of the Senate has provoked a very severe criticism

from Congressman Clark of Iowa, who used to be editor of the Keokuk *Gate City* and now writes occasional letters to it from Washington. He characterized the bill as it was remade by the upper branch "a fantastic measure that ought not to become law; that shuts out a man's wife and children, and brings in his grandfather; that shuts out a German Mennonite, who stands at the head of industrious genuine Christian Protestant piety and civilization, and brings in a Cuban revolutionist half-breed, who worships a crucifix and chops off the head of a woman with a blade like a corn-cutter."

Civil-service reformers will read with great satisfaction the exposition in the *Sun's* Washington correspondence of the extent to which the spoils system has been abolished. While the pressure for office under the next Administration is greater than was ever before known, the number of places available is far smaller. Excepting the small post-offices, the *Sun's* correspondent reports that "there are not now 10,000 offices of all kinds in the United States left outside of the operation of the civil-service law." Moreover, the idea of many office-seekers that the law is a joke, and that Senators and Representatives can get around it, is all wrong. The dispatch says on this point:

> "The office seekers will find it a very serious matter. Almost every Government office in all the departments, below the grade of those the appointees to which must be nominated by the President and confirmed by the Senate, is now under the jurisdiction of the civil-service law, and can be filled only by those who are certified by the Civil-Service Commission as having made the highest record in competitive examinations open to all."

The only "ray of hope" visible is the chance that the new Administration will remove a lot of the Democrats in the higher places, promote Republican subordinates, and then fill the very lowest grades from the Republican applicants. "Under this method the new-comers must take all the menial places; but under the circumstances it looks as if they must be satisfied with these or nothing." To appreciate what all this means, one must remember that it is only fourteen years this winter since the civil-service act was passed as a harmless concession to the reformers.

All the news that we get as to the attitude of the McKinley Administration towards civil-service reform continues to be most encouraging. Republican spoilsmen have been hoping that the next President would "let down the bars," and render it easy to make vacancies which could be filled by the "right men." Probably the easiest way of doing this would be by making the examinations now required of applicants for desirable consular positions so easy that the places might be disposed of in the old way of favoritism. But a long statement from Canton as to Mr. McKinley's intentions in this matter represents that President Cleveland's order requiring examinations is considered "an excellent provision"; that Mr. McKinley "doubtless thinks that a man who cannot pass a reasonable examination upon subjects with which he will have to deal in his official capacity, is not fit to be appointed"; and—best or worst of all, according to the point of view—that "there is every reason to believe these examinations will be made pretty rigorous."

The President's order consolidating pension agencies will result in a saving of $161,000 a year. This will pain Chairman Dingley, who is certain that economy in governmental expenditure is impossible. Of course a large mind like his has nothing but scorn for a petty saving of $161,000 annually. It is millions or nothing with him, and as he sees no chance for cutting off millions at a stroke, he concludes that nothing can be cut off at all. But economies on a large scale are not the salvation of either individual or Government when embarrassed. They are, in fact, seldom possible, but small savings here and there are not only possible but highly desirable. The pension service will be not merely not crippled, but actually improved by cutting off $161,000 a year in unnecessary salaries. Two hundred thousand dollars a year saving in salaries was made in a single department of the Treasury as a result of the inquiries made by the Dockery committee. There is no doubt that similar retrenchments could be made in almost every branch of the Government service, were Congress resolutely bent on economy and ready to approach the question in a business-like spirit. A few more such economies would soon foot up a million or two a year, and so make a sum large enough for lavish Mr. Dingley to think it worth while to look at.

The problem of breaking down the civil-service law is causing the Platt statesmen at Albany a great deal of anxious thought, but a promising start toward a satisfactory solution was made last week when the Senate judiciary committee appointed as a sub-committee to draw up a bill Messrs. Lexow, Krum, and Cantor. Mr. Cantor, the third member of the sub-committee, is Croker's old agent at Albany, and has all the usual Tammany contempt for "civil service." The sub-committee is in fact a perfect illustration of the natural way in which the Platt and Tammany machines come together whenever an assault is to be made upon good government. What is delaying the plans of the anti-civil-service reformers at present is the pending decision of the courts upon the interpretation of the law given recently by Judge Keogh, which, if sustained by the Court of Appeals, will make all efforts to break down the law unavailing. He held that the constitutional amendment was self-executing, and that nothing that the Legislature might do, or fail to do, could have any effect. If the Court of Appeals shall sustain that view, which its previous decisions give the strongest reasons for believing that it will, even the great minds of Lexow, Krum, and Cantor will find the problem of upsetting the law too difficult for them. The word "competitive" is the chief foe they have to encounter, for no examination except by a board of commissioners outside the departments will meet this demand. Col. Waring gave the enemies of the law a severe blow on the very day of the sub-committee's appointment, when he asked to be relieved of the conduct of examinations for his department. They have been in the habit of pointing to his control of the examinations as proof of the superior merit of the department method. He says it is an annoyance, that it interferes with the work of the department, and that complete outside control of the examinations would be more desirable in every way. Mr. Roosevelt has made similar statements about the Police Board, so that the "Progressives" have really nothing in support of their plans save their desire to get possession of the offices for the "men they want." Gov. Black is with them, of course. A Governor who is capable of appointing Payn has put himself outside the pale of speculation as to his course in any attack upon good government. Only the Constitution and the courts stand in the way of the hungry Boys of both parties; but these form a barrier which even Lexow must respect.

Payn's nomination was "jammed through" the New York Senate in the best Platt style, but there was an unusual amount of friction developed in the process. It was an unprecedented thing to have nine Republican Senators, one-fourth of the entire number, refuse to obey orders, and, what was even more surprising, to have many of them accompany their refusal with reasons for it which confirmed all that the opponents of the boss had said about the transaction. If there had been any doubt about Payn as "a stench in the nostrils of all good and honest men" before the debate on his confirmation, there was none after it had ended. The charge had been confirmed by the adverse votes of nine Republican Senators and by the plain and courageous speeches of most of them. As for the speeches in his defence, these should be interpreted as also confirming the charge. Gov. Black's personal share in the business was revealed by several of the speakers. "I told the Governor," said Mr. Brush, "that I could not respect myself and could not face my own conscience and vote yes on this question." "I went to the Governor," said Mr. Tib-

bits, "and told him it was impossible for me to stand by him." What must be the character of a Governor who compels members of his own party to say such things as these to him? Can there be a political future in this State for a Chief Executive who begs Senators to do him the personal favor of helping to put a notorious scoundrel in office, and who is subjected to the humiliation of having them refuse because their consciences and self-respect will not permit them to grant this request?

The meeting held last week in this city to procure the release of the Irish dynamite prisoners in England was addressed by Mr. John E. Redmond, the Irish member of Parliament, and Mr. Bourke Cockran, and doubtless its object was a good one. Mr. Redmond's speech was temperate and persuasive. He admitted he "was not there to make charges against English judges." He dwelt on the public excitement at the time of the trials, and on the fact that the men were tried under the "treason felony act," which was passed to catch John Mitchell in 1848. But as long as the Irish resort to physical force, we must expect the English to defend themselves by ferocious legislation. When we threaten people's lives, we must expect them to shoot us. There is something unmanly in the Irish complaints of the way Englishmen meet attempts to kill them or blow them up. It is undoubtedly bad policy to keep the Irish dynamiters in jail after the establishment of the new régime and the virtual abandonment of coercion; but how on earth does Mr. Bourke Cockran expect to help their deliverance by ascribing their condemnation to "British malignity," and calling the courts which condemn them, "not asylums of law, but engines of lawlessness," and by justifying the hesitation of the Senate to ratify the arbitration treaty on the ground that Great Britain is properly an object of suspicion and distrust? Englishmen are human, and bad people to threaten or bully. It is poor rhetoric to ask them to do justice because they are notorious scoundrels. We would suggest to all holders of meetings in America for the redress of Irish wrongs, to try moderation, suavity, reasonableness, and appeals to peace, good will, and civilization. The days for the more furious Irish ranting have gone by. The Irish are now strong enough for sober speech.

The Cuban reforms authorized on Thursday by royal decree appear to be somewhat more liberal than those voted by the Cortes in 1895 on the eve of the present rebellion. Ten years ago they would have been received with enthusiasm in Cuba and regarded as a complete fulfilment of the wishes of the autonomist party. Even the smaller measure of home rule offered in 1895 was accepted by all but two of the Cuban Deputies as satisfactory. But we regret to say that there is no likelihood of the present offer bringing peace to distracted Cuba. The matter has passed beyond the sphere of political agitation, and become a question of desperate and implacable war. In Spain itself the Government's offers seem to be taken as a sign of weakness, and it will be strange if the rebels do not take the same view and feel themselves correspondingly encouraged. Not long ago Cánovas was stoutly maintaining that no reforms would be granted until the rebellion was utterly stamped out. There is no pretence that the island is pacified, nor even that it can be before the rainy season sets in in June. Thus the offer of a limited autonomy necessarily has the air of something conceded in alarm or as a result of diplomatic pressure. Where the real pacification has taken place is at Washington. The bellicose Lodge, the for-one-day furious Cameron, the enraged Sherman, all are silent. We understand that a hint from McKinley has brought about this refreshing change. Pot-valiant Republicans, the President-elect has intimated, are to him just now *personæ non gratæ*. Hence the late limitation of Cuban patriotism in the Senate to Democrats like Hill and Turpie, at the end of their terms and with nothing to expect from the incoming President.

That the French press should have burst into flame at Sir Michael Hicks-Beach's speech on Egypt is only the natural result of putting a spark to tinder. It was not so much the substance as the manner of the Chancellor's remarks that played the mischief. It was well understood that England proposes now to stay in Egypt and to push on to Khartum when she gets ready; also, that she will pay the bills out of her own treasury. These facts could have been calmly stated so as to offend nobody, but Sir Michael seems to have gone out of his way to rasp French sensibilities and to give a serious shock, as John Morley instantly pointed out, to the delicate negotiations about the Turkish situation. The coöperation and good will of France and Russia in that matter are indispensable; and just after Lord Salisbury had apparently secured them, along comes his Chancellor to imperil the European concert, and to do it in an entirely unnecessary way. The performance is a curious commentary on Salisbury's own sarcastic remarks made no longer ago than the debate on the Address, about the Jingo statesmen whose patriotism gets the better of their judgment. No wonder that everybody is guessing at the possible motives of Sir Michael's outbreak. If it were only a personal question, the solution might be found in the Chancellor's having to eat his own words of last year. Then he assured the British taxpayer that the Egyptian expedition would not cost him one penny; now he has to ask for about $4,000,000 on that account. A little patriotic big talk might naturally seem a good way to make the dose go down easily. But the Chancellor is a member of the Cabinet, and unless he has been guilty of an extraordinary indiscretion, his words must be supposed to have the approval of the Prime Minister.

The Balfour myth is one of extraordinary sway in all lands but England. In Germany Herr Arendt talks mysteriously of what "my friend Mr. Balfour" is going to do for bimetallism; in France the English First Lord of the Treasury is a mighty power to sustain drooping bimetallic hopes; what awe Mr. Whitney and Senator Hoar entertain for the brainy, the brilliant, the bimetallic Balfour, we all know. In his own country, unfortunately, in the House of Commons itself, which he leads, they laugh at him. Sir William Harcourt, in the debate on the Address, had particularly good sport with Balfour. He was referring to the First Lord's amazing speech on Irish over-taxation. Said Sir William:

> "I think the First Lord of the Treasury might have done well to have imitated the reserve of the Chancellor of the Exchequer the other day; but down in Lancashire the First Lord plunged into the matter with a rashness which alarmed some of his best supporters. As far as I can understand, he thinks that indirect taxation is not of much account, and that it is a quantity that might be neglected. His words were that a man may consume or not consume, as he pleases—in a word, that if he consumes he pays, and if he does not consume he does not pay. That settles the question of indirect taxation. Then the right honorable gentleman says there is that in regard to indirect taxation which there is not in regard to direct taxation, and that there is an element of free will in the matter. Truly, a Pelagian sentiment—meaning, in a word, that direct taxation is of the nature of predestinational doctrine."

As soon as he could for the laughter, Sir William proceeded: "I cannot think that this was one of the most fortunate of the essays of the right honorable gentleman. I have known him to do better even on the subject of bimetallism." This set the House roaring again. The simple truth seems to be that Balfour took up the bimetallist dodge to humor his Manchester constituents whose trade with India was languishing, and who thought the fall in silver was the cause of it. Trade has since picked up, and the Manchester spinners have got over their bimetallic mania, but Mr. Balfour sticks to it out of sheer Scotch obstinacy. Held purely as an academic thesis, his bimetallism (he has had to confess) will never influence his official action in the slightest degree, and so it is no wonder that it has become an object of general ridicule in England. To render it completely ludicrous, it was only necessary that the senior Senator from Massachusetts should publicly make a fetish of it.

REPORT ON THE INDIANAPOLIS CONFERENCE.

THE meeting of the Chamber of Commerce on Thursday was one of unusual importance. Mr. J. Harsen Rhoades made his report as chairman of the delegation to the Indianapolis conference, and accompanied it with a brief speech which was warmly applauded. Then Mr. William E. Dodge gave a highly interesting account of what he had learned as a member of the committee at Indianapolis which reported the platform and plan of procedure adopted there. The platform, as is well known, embraced three leading ideas—(1) the maintenance of the gold standard; (2) retirement of the Government's legal-tender notes; (3) banking reform. Upon the last-mentioned subject, which is perhaps the most difficult one to deal with, Mr. Dodge gave a sympathetic review of the facts and ideas brought to his notice by gentlemen on the committee representing Southern States that cast their votes for Bryan in the recent election. He was surprised to learn from these men that it was not Bryan or silver that they wanted or voted for, but "some change to bring relief from the terrible condition of poverty and scarcity of money under which they labored." Then he continued:

"I found that there were great sections of the Southern and Western country where there was absolutely no money at all; where the most primitive forms of barter obtained; where everything was most disorganized. One gentleman told me that in his county, which was quite a rich agricultural county, by some happy accident a fifty dollar bank bill had come down into the county, and that he had taken a horse and buggy and spent four days in visiting all the towns in the county striving to get it changed into smaller bills, but had been unable to do so, and finally was obliged to send it to Richmond. There were Senators who told me that their constituents never saw a dollar of money from the beginning of the year to the end, with the result that they had constantly to go into debt to the local storekeepers. The local storekeepers received their pay in kind. In fact, everything was drifting back to the old times before money was invented. And this was not in one section of the country only, but in large sections."

That the condition described by Mr. Dodge exists in large districts of the South is undoubtedly true. That it is the cause of the discontent which led those States to vote for Bryan and free silver is also true. That anything which cures this evil will cure those States of Bryanism and free-silverism is the belief of the very able and earnest opponents of free silver there resident. The question, therefore, of immediate concern is, how far the condition described is due to the want of banking facilities, how far this want is due to the national banking act and to the national Government in general, and how far to other causes. However much we may desire to eradicate these evils, we must first be satisfied of their origin, since otherwise any remedy that may be devised will fail to reach the disease.

Let us first dispel an illusion that we meet with in the recent testimony of Mr. Royall of Virginia before the House committee on banking and currency. Mr. Royall is a believer in the old ante-bellum system of State banks. Why does he believe in it? Because it furnished a cheap and elastic local currency. What is meant by a local currency? One which will circulate at home and nowhere else. The word home is itself rather elastic. Mr. Johnson, a member of the committee, who is under no prejudice in favor of the present bank-note system, but rather opposed to it, remarked to Mr. Royall that he could hardly reconcile himself to the idea that in order to have a reasonable amount of money in any locality it must of necessity be money which is not of uniform value throughout the country. To this Mr. Royall replied:

"We have found by bitter experience that if you put the Government's endorsement on it, we cannot retain it a moment. It is good then all over the country and everybody wants it. As long as it is backed by our credit only, it is good enough for us, but not good enough for you."

This is like saying that the kind of money wanted is a kind that will stay in a man's pocket—a kind that he cannot spend because nobody else will take it. This is a complete reversal of the ideas usually attached to money, the first requisite of which is that the next man shall be willing to take it at par for anything he has to sell. Suppose that a planter has a pocket full of the local money pictured to us by Mr. Royall. He does not want to keep it for ever. Money is only good to buy things with. He offers it to the country storekeeper for supplies. As the latter does not want to keep it for ever, he looks at it rather sharply and asks what he can do with it by way of replenishing his stock. Will the New Orleans merchant take it at par? That depends upon what the New Orleans merchant can do with it. Can he replenish his stock with it? If not, he will have none of it. Therefore it will be a local currency because nobody can get rid of it. Mr. Royall's idea is that there can be a kind of money that will circulate—that is, buy goods—at home, but will not go away from home because the issuing banks will furnish drafts on other towns and cities in exchange for it. If they will do that, and if the other towns and cities believe that they will, the money ceases to fulfil the conception of a local currency. It becomes national, or at all events excursive, by the very fact of being good.

It cannot reasonably be asked that the people of the North shall consent to a kind of money (which must necessarily be permissible in all the States) which shall be restricted to local use by reason of being more or less bad, so that other people will not take it except after a dispute or at a discount. A very little reflection must teach the Southern people that this kind of money would defeat the very object for which money exists. Money is an instrument of exchange. A very slight experience with a kind of money that "would not pass" would serve to dispel all the illusions of its devotees. There would be no objections, however, to a trial of it in any locality if it could be restricted to that locality; but under our system of government no such thing is possible.

None the less do we consider Mr. Dodge's remarks at the Chamber of Commerce meeting important and timely and stimulating. They provoke thought and discussion on the most serious problem of the hour. There is nothing more needed than an inquiry into the causes of the dearth of money and credit in the localities of which he speaks. How far is this dearth due to a lack of banking facilities? How far is this lack due to legislation, and how far to the state of society, the non-enforcement of law, lack of security, or other causes? That the national banking law, on its note-issuing side, is open to useful amendment, consistent with entire safety, is an opinion we have often expressed and which we still entertain, but we hold that safety cannot be dispensed with, and that a bank circulation which will not circulate is a phantasm even more illusory than free silver.

OFFICES AND POSITIONS.

THE question of municipal ownership of street railways, and of municipal conduct of business generally, has come up again of late in various ways and places. Boston has determined to set up a city printing-office, and "organized labor" heartily endorses the project, on the ground that it promises the printers employed "better wages for less work." Boston organized labor also pronounced, at the time of the great strike in December, in favor of the city's taking over the street railways. Similar proposals have been made in Cleveland. As for New York, the number of things our big-hearted social reformers would have the city undertake for the benefit of the employed is practically unlimited.

All these signs of the times cause great elation in a certain sect of social philosophers. According to them, municipal ownership, and the state ownership that goes with it, are coming on apace and with certainty, and they see a vast transcendental significance in the whole movement. It is the State "coming to self-consciousness." It is society knowing itself to be "organic." It is "social solidarity," "the whole existing for the individual and the individual for the whole," with many other oracular deliverances of the sort. Anyhow, the régime of individual free contract has broken down, except in the mind of a few benighted old fogies, and the beautiful and beneficent reign of a self-conscious and organic state is about to be established.

For our part, we seem to see a simpler explanation of the phenomenon. We do not know much about the State becoming self-conscious; if it ever did such a thing in these days, we should think it would feel like going off quietly into a corner to blush over the self it had for the first time discovered. But we have no head for these deep things. We can see, however, certain very old and very human elements of greed, of laziness and selfishness, of pushing for personal advantage, which have been operative in all history, and which are quite sufficient to account for the movement to convert city and State into a bountiful employer of labor. It is a fact, proved over and over again, that the public, when employing labor, pays "the highest prevailing rate of wages for the shortest prevailing day's labor." Mr. Ethelbert Stewart has lately made public some investigations of his in Philadelphia, New York, Baltimore, and Boston, which again show the truth of this. In Baltimore, for example:

"The blacksmiths employed on public work directed by the city or State, working nine hours a day, were paid from $12 to $17 a week, while those hired by contractors or firms worked ten hours a day, and received from $9.50 to $14 a week. A similar state of things was found to obtain substantially in all other employments, while the few exceptions that appeared at first sight turned out, on a closer investigation, to be more apparent than real."

Is there not here motive enough for organized labor to favor municipal ownership? We surely do not need to call in a mystic State becoming conscious of itself; consciousness of high wages and a "soft snap" is cause sufficient. We do not in the least blame organized labor for desiring an extension to itself of these blessings of municipal and State employment. We would do the same thing were we organized labor. Such action has been directly invited by public extravagance in salaries and wages. Look at the matter in another way. Workingmen have seen the police, the firemen, the letter-carriers, organized as a compact body, given pay above the market rates, able to combine and terrify legislators into increasing their salaries and their privileges from time to time. Why should they not covet similar favors for themselves? Why should they not desire to see street-car conductors and drivers and gas-meter men and pavers and rammers and scavengers in like manner given special pay and special privileges by the city? The thing is perfectly natural. It takes no profound conception of the State, expressed in big German words, to make us understand why these things should be. The good old democratic principle of "I'm as good as you be" goes far towards explaining the mystery.

Nor is it all a question of higher wages for less work. The great distinction between an office and a position comes in here. A position is an opportunity to work, to do something; an office is an opportunity to get something. To hold a position, you have to know your business. You have to be faithful, industrious, efficient. To hold an office, you have only to "get there," and then you may be as indolent and inefficient as you please. Out of a position you may be turned instanter for negligence or ill conduct. From the typical office you can be removed only on formal charges, after a long trial, with ample opportunity for appeal, for mandamuses and writs of certiorari, for veteran-preference and triumphant reinstatement. A corporation has an unpleasant way of watching your work and testing your efficiency; a city pays you more than you are worth, and asks no questions. Therefore away with oppressive private ownership, and hurrah for municipal ownership! Let printing, and blacksmithing, and street-car driving, and all the rest be made offices instead of positions, and the millennium will be upon us.

This, we admit, is a very unheroic explanation of the movement for municipal ownership. It is much grander to talk social metaphysics on the subject, but the facts are as we say. It is no theory of the State that chokes our cities with needy people from the country, or that sets organized labor clamoring for city employment; it is just a plain American eye for the main chance. The idea has got abroad that the city is a generous old grandmother with lots of money to squander. The thriftless ne'er-do-weels simply want to be on hand for their share. It is preposterous, people say, to suppose that the city and State can employ everybody at high wages; who will foot the bills? But it is no more preposterous than that city and State should employ anybody to do work for which he is not fitted, and pay inefficiency more than the market rate for efficiency. Public extravagance and favoritism, increasing lavish expenditures, and multiplication of offices in city, State, and nation—these are the great provokers of Socialism. Anybody who wants to fight Socialism effectively had better begin by fighting them.

THE CHARTER EXPLANATION.

The Charter Commissioners have been induced, after many weeks of urging, to say something in reply to the shower of objections to their work which has been pouring in on them ever since the publication of their report. Gen. Tracy gave to a reporter for the *Evening Post* on Wednesday week something in the nature of a defence of the scheme. It seems that he is the member who is "irrevocably wedded" to the "new assembly" feature of the charter, on the ground that the "present municipal legislature is absolutely powerless"; that the people who live under it are also "powerless"; that the people have no control of their affairs between elections, and are "voiceless" and mere spectators, while their money is being voted, and that the Government is, therefore, an "autocratic, bureaucratic Government." What strikes one as extraordinary about this is, that not a single reason is presented in favor of the "new assembly," except that Gen. Tracy wishes it, and thinks it would be a good thing. He ignores the fact that the city tried such a legislature as he proposes, for over half a century, and that as the city grew in wealth and its population became more heterogeneous, the legislature became a nuisance; its powers were gradually restricted, and it was finally abolished. It was abolished, that is, as the result of experience of its working, because it was corrupt and incompetent, and because the people were voiceless while it was voting away their money. And here we must quote an astonishing passage in Gen. Tracy's statement:

"If, after experiment, it should be found that those who think with me are mistaken, and that the people are not yet sufficiently educated to be trusted in any measure with the conduct of their municipal business, the powers bestowed by the new charter can be withdrawn by the State Legislature, as when ten years ago the Common Council was reduced to its present impotency."

So that the promised "home rule" consists simply in permission to run a career of folly and extravagance until the Legislature once more thinks it advisable to withdraw the charter or alter it. It is probably too favorable a supposition to say the Legislature would withdraw it only after some years of folly. As a matter of fact, it would probably withdraw it when directed to do so by the boss for the time being, without any open reason at all. The measure would be "jammed through," and the malcontents be invited to "shut up."

President Low followed Gen. Tracy's example and explained his action about the Greater New York charter the next day, and Mr. Dillon submitted another explanation on Friday afternoon. Mr. Dillon's statement does not call for much comment. He says that "European experience" justifies the size of the Assembly; that in the "little town of Carlsbad," for instance, they have thirty-six municipal councillors; that as the States have two legislative bodies, New York ought to have two; that two houses will prevent precipitate action; that "a higher grade of men in point of intelligence and character" will find their way into the upper house than into the lower; that the Commission "carefully considered" the size of the districts; that the municipal Assembly will have limited and guarded powers; that it has neither too much power nor too little, but just enough; that the bi-partisan Police Board is a good thing; that to provide for separating the Election from the Police Department is "a theoretic and doctrinaire suggestion." It will be seen that all this is simply Mr. Dillon's assertions and prophecies. There is not the smallest reference to American experience or to the experience of New York. It surprises one in reading it that Mr. Dillon should have

attempted drafting a charter with so little apparent preparation for the work in the shape of reading, or acquaintance with our peculiar conditions. A complete refutation of all this, except the prophecies, may be found in President Low's chapter on municipal government in Bryce's 'American Commonwealth.' The prophecies of these gentlemen we can treat only with respectful silence. There is no way, that we know, of getting the better of a prophet except one, and that is to disbelieve him.

In Mr. Low's statement we find that, in the Commission, he advocated a single legislative chamber, a one-headed Police Department, and a separate Board of Elections. He says:

"It is well known that I favor these things, and it ought to have been taken for granted that I have urged them upon the Commission. Except for Gen. Tracy's interview, I should have remained silent until the Commission had reported to the Legislature. I have urged the single chamber, among other reasons, because I think it lends itself to efficiency, and, in the work of a city, efficiency is a very important factor."

But his action could not have been known, seeing that he signed the report recommending these very things of which he disapproved. His proper course was either to enter his protest against them in the report, or else to make a minority report, setting forth his objections and using the arguments against them he has used already in Bryce's book and in the *Century Magazine*. His failure to do so was very unusual, and excited the surprise of the public. It was the more unfortunate because we believe the instruction of the public to be the very highest duty of men in Mr. Low's position, particularly in our present condition. He owed it to the people of this city to discuss publicly and freely the proposed charter, in anything he printed on the subject, and especially in the report. It was due to them to reiterate there his objections to the proposed scheme; and the more unwilling its promoters were to talk about it, the more private the meetings of the Commission, the greater the haste in getting it before the Legislature, the greater the reluctance to submit it to the popular vote, the more outspoken should he have been. Nothing is more lamentable at this crisis than the silence imposed on our public men by the bosses. Not only has Mr. Low failed to promulgate his own views, but he has left the public to suppose he no longer held them.

He now proposes to support the charter because "it is not settled for all time if it works badly." This disposes of the "home-rule" pretension. If, we repeat, the charter can be supervised, altered, or abolished by the Legislature for working badly, the Assembly will not exercise "home rule"; it will simply enjoy delegated rule. What the authors of this charter mean by "home rule" is simply large powers which need not last one minute longer than the majority in the Legislature, or Mr. Platt, pleases. President Low now says that it makes no difference whether a city has one or two branches in its legislature; that "the form of a city legislature is a matter of comparative unimportance as long as its membership shall be nominated by party machinery as at present." But he showed clearly in Bryce's book that "American experience" proved that all city legislatures were bad, in that they were founded on a radical mistake as to the nature of the city. What he now says of the comparative unimportance of their form as long as the nominating machinery is what it is, is an admission that the party machinery is the cause of their badness. Is it not, therefore, extraordinary that by way of cure he should join in creating a city legislature of his own worst variety, knowing it would be filled by this same party machinery?

He says, secondly, that the defects, which he acknowledges in the charter, "are trifling compared with the fundamental advantages of consolidation." But to give this remark any force he should show that the charter with a municipal assembly is necessary to consolidation, which nobody pretends. Consolidation could take place without this charter and without an assembly. The new city could be governed in the same way as the old one, in the opinion of thousands of prophets. Besides, the defects in the charter are fundamental as well as the advantages. If they strengthen the machine by the creation of a swarm of new salaried, elective offices, they are fatal, according to Mr. Low himself. This type, he says, has been largely abandoned in the United States, "because city government has not shown itself worthy to be trusted with powers so extensive."

His last argument is simple prophecy—that he "believes" this will be a better charter than any now existing; but why it should be better he does not state. If he could show that in some American city the government had been improved by the creation, under boss nominations, of a large municipal legislature, it would go far to prove his case. But he cannot cite anything of the sort. Everything we know of American municipal history in this country goes to show that the more salaried elective officers there are, and the more responsibility is divided, the worse the cities are off. We could cite from experience a hundred reasons for thinking he is wrong; for thinking he is right there is no reason except his own hopeful anticipations and those of Messrs. Tracy and Dillon. There is no example in American history of an enlargement of powers having improved a legislative body. The whole trend of American politics for fifty years is towards a restriction of legislative powers. If the notion were true that giving this municipal Assembly rule over a larger area was sure to improve its quality, the Legislature at Albany would be a model body, for it rules both the city and State. But is it?

COÖPERATIVE HISTORY.

Of making histories on the coöperative plan, there is, apparently, no end. The latest project is the "Cambridge Modern History," which Lord Acton is to edit, and to which nearly every prominent historical scholar in England is to contribute. The period to be covered extends from the close of the Middle Ages to the present time. To "expose the annals of nations" "at their point of junction with the central stream, when they cease to be inert, and carry tribute to the common fortune of mankind"; to treat events "in the natural order of cause and effect, not in the merely outward order of place and time"; to show the achievements of the nineteenth century "since the opening of archives has quickened the pace, and history has risen to be a sovereign and progressive science, serving no cause but its own"; to exhibit, "in their origin and progress and substance," the dominant forces of the present day, and illustrate them by illumination of the past—such are the ambitious aims of this new venture. The fact that the editor is a scholar of great attainments and catholic temper, and his collaborators the most distinguished body of men ever enlisted for such a service, is enough to secure for the undertaking more than ordinary consideration.

It must be admitted, however, that the inherent difficulties of such a task, in the present condition of historical study, are very considerable. If we read the somewhat turgid prospectus aright, Lord Acton and his associates are not without hope of doing for the history of the past four or five hundred years a work similar in kind, only far more perfect in detail, to that associated with the names of a long line of writers, from Herodotus onward, who have "taken the history of civilization for their topic and the known world for their domain." "Historic thought," we are told, "will have a place proportioned to historic action, and the march of European intellect will be traced as it came successively under the dominant influence of religious, philosophical, political, and scientific ideas." The later volumes "will endeavor . . . to exhibit the cause, and the growth, and the power of the ruling currents that still govern and divide the world, and to provide chart and compass for the age to come." The idea is fascinating, but it would be easier of realization if our knowledge of history were wider and more exact, and human judgments less diversified. To begin with, it is easy to overestimate very seriously the amount of assured historical knowledge which the industry of scholars during the present century has made available. We have had, it is true, edited documents by the thousand, monographs by the hundred, and memoirs, diaries, and letters to repletion. The publications of historical societies and the files of historical journals would, of themselves, make a large library. Yet no historical student works long in this mass of material without finding how many and important are the subjects yet unexplored. This is conspicuously true in the period which Lord Acton's history proposes to cover. We have had as yet, for example, no exhaustive critical examination of the century preceding the outbreak of the Lutheran Reformation, or of the seventy years prior to the French Revolution. Of many aspects of the

present century we know less, proportionately, than we do of several centuries before the year 1000. In economic history we have made little more than a beginning; and the same is true of the history of government and law. Until these gaps are filled, it may be doubted whether we are in position to form comprehensive judgments, or to treat of the history of modern civilization with greater success than did those earlier writers who, with less available material, came near to knowing it all. It is with historical as with physical science: the activity of research has raised nearly as many questions as it has answered.

Then there is the question of the point of view. Lord Acton evidently regards history as something more than annals or chronicle, and the interpretation of events as of at least equal importance with their correct narration. Interpretation, however, means, of course, a personal judgment, a rational and consistent theory of things; and even were facts far more numerous than they are, it is clear that the work of an editor at this point is bound to be one of difficulty and delicacy, involving nothing less than the success or failure of his entire scheme. The proper standpoint—whether Catholic or Protestant, democratic or monarchical, economic or political, legal or constitutional—from which to judge of five centuries of human progress is a matter on which there is not, as yet, any approach to unanimity among historians themselves; indeed, so diverse are the views, and so great has been the revolt against mischievous theories and assumptions, that there are not wanting at the present day eminent scholars who find their ideal of historical riting in the work of the mediæval chronicler, who set down in order what he heard or saw, and left the rest to God. The "Cambridge Modern History" is to begin with the close of the Middle Ages. Now it is not too much to say that upon the view taken of the Middle Ages, more than of any other period, depends, in considerable measure, the interpretation of the succeeding centuries—whether the attempt shall still be made to mark off sharply "mediæval" from "modern" times, or whether, as scholars are more and more coming to think, the theory of the "continuity" of history finds in this particular period especial illustration. Lord Acton's prospectus seems to imply the acceptance of this latter view, and the weight of his authority will be very great; but the question, after all, is one of interpretation as well as of fact. Clearly we have to reckon here with one of the secrets of great historical writing —the sane and convincing judgment of the historian himself as to the significance of his facts.

Lastly, there is the requirement of unity in conception and presentation—that one thing needful which no historical work on the co-operative plan has yet attained. To secure the assistance of eminent specialists is always possible, but to mould their work into an organic whole is quite another matter. Winsor's 'Narrative and Critical History of America,' unquestionably the greatest product of American historical scholarship, is not, in any proper sense, a history at all, but a collection of monographs. Traill's 'Social England' is repetitious, contradictory, and marvellously uneven. The 'Histoire Générale' of Lavisse and Rambaud gives disproportionate space to France, and is weak, at least in its earlier volumes, on ecclesiastical topics. A perusal of the long list of scholars whom Lord Acton has called to his aid shows many fundamental divergences of view. Mr. Lecky, for example, can speak with authority regarding Ireland, and Mr. John Morley regarding France, but we fancy that even Lord Acton would find it difficult to reconcile their estimates of democracy, while in religious matters neither of them would be likely to agree with Mr. Frederic Harrison, as the latter would certainly differ from Mr. R. H. Hutton, Principal Fairbairn, or the Bishop of London. Experience has abundantly shown that no historical work, whatever the circumstances of its composition, can win large success unless it is, in reality, the product of a single mind. Some such result as this Lord Acton evidently hopes to attain: if he succeeds, the "Cambridge Modern History" will be, in the fullest sense of the term, an epoch-making work.

THE FRENCH IN NORTH AFRICA.

TUNIS, November, 1896.

IN the first of these letters from North Africa it was remarked that in ancient times the southern shores of the Mediterranean belonged equally with the northern shores to the world of civilization. Their barbarism dates only from the Mohammedan conquests of the seventh and eighth centuries. Before that time there had been a Carthaginian civilization in what is now Tunis and along the coasts of Eastern Algeria, a Greek civilization to the eastward of Tripoli, and ultimately a Roman civilization all the way from the frontiers of Egypt to the Straits of Gibraltar. The Mediterranean was the centre of the ancient world, and all the peoples that lay round it formed for six centuries after Julius Caesar one political and commercial whole, and for two centuries at least one ecclesiastical whole also. In the dissolution of the Roman Empire the African provinces, though not the first group of provinces to be torn away, were the group that was torn away most completely. Efforts were made by Christian Powers long afterwards to recover parts of them. The Norman King of Sicily conquered one part, the Emperor Charles V. conquered another. But these acquisitions were soon lost, and the process of recovering Africa from Mussulman barbarism was not seriously undertaken till our own time, when the European States had made such prodigious advances over the Mussulman states in science and in organization that their victory was prompt and easy.

The process began with the French expedition to Algiers in 1829. The Moorish tribes, and especially the warlike Kabyles, gave the French a good deal of trouble, just as the Kafirs gave the English at the same time a good deal of trouble at the other end of the African Continent. But this was merely because the European troops were few and the country difficult. There never was any more doubt that the French would prevail than there was that the English would reduce the Kafirs. The French are still unpopular with most of the natives of Algeria, and those who know the country declare that if France were again involved in a disaster like that of 1870, she would again, as in 1871, find a revolt break out among the tribes. Though Algeria is now incorporated with France, and returns members to the French Legislature, the number of French colonists established there is relatively small, and the mass of the native population has remained but little affected by French habits and ideas. Still the country is won for civilization, and is in no risk of being lost as it was when the Vandals and the Arabs conquered it.

The second move towards the recovery of Africa was the French occupation of Tunis in 1881. The third was the British occupation of Egypt in 1882. Egypt has always had a history of its own, and need not be discussed here. But the case of Tunis is interesting. The French have not formally annexed it, still less have they incorporated it, like Algeria, with European France. They govern in the name of the Bey, who is still treated as a sovereign, and is even permitted to administer Mussulman justice between Mussulmans. The old treaties between Tunis and several European Powers, therefore, remained in force, and it has been one of the chief aims of the French to replace them by new treaties, more favorable to French commerce, or at least more hostile to the commerce of other countries. This they have lately accomplished as regards Italy. They are now anxious to achieve it as regards England, and are thought likely to succeed. For Lord Salisbury is supposed to be willing to put France in good humor by concessions, even though these concessions should injure the thriving trade which England now drives with the Tunisian ports in cotton goods. The revenues of the Tunisian dominions—the Regency (as it is called) of Tunis — are still nominally the Bey's revenues. They are, therefore, applied locally. Nothing goes to France, and no French money is spent in Tunis; the cost of the French officials and the French army of occupation being defrayed by these local funds. One result of this has been that Tunis has been made to pay for the fortification of the harbor of Bizerta, now one of the strongest places, as well as one of the most spacious land-locked havens, in the whole Mediterranean. The creation of this naval stronghold is, of course, in the interests of France, and of France only, not in any way of the Bey or his subjects. But the revenues of the Regency have paid for the building of the moles and forts which France garrisons and purposes to make a second Toulon.

The fifteen years of French occupation have been years of almost unbroken peace, very unlike the first fifteen years of the conquest of Algeria, for the population of the Regency is easy-going and unwarlike. Even in the sacred city of Kerwan, the supposed hotbed of Mohammedan fanaticism, scarcely any resistance was offered to the invaders in 1881. The country seems now perfectly quiet. One does not hear of brigandage nor of any resistance to French authority. So far, therefore, it may seem that the French have an easy task before them, and that the civilization or Europeanization of the country may proceed rapidly. No careful observer will, however, feel sure that this will be the case, when he reflects both on the character of the population and on the aptitudes, or inaptitudes, of the French for colonization. Though naturally very rich, as their condition under Carthage and Rome proves, the territories of the Regency are very thinly peopled. That the population has increased within the last sixty years is shown by the fact that wild beasts, such as lions and hyenas, formerly not uncommon in the mountains even within forty miles of Tunis, have now become extremely rare. But the people are still few, having regard to the area and its fertility, and in the rural parts they are extremely unprogressive. Large regions of the interior are left to semi-nomad tribes, apparently rather Arab than Berber in their blood, who live in tents or in wretched huts,

and scratch the soil now in one place, now in another. They are very backward, and have so few wants as to have little notion of trying to better their condition. Yet it is on them that any one wishing to develop the agricultural resources of the interior must rely for labor.

The Mohammedans of the maritime towns are more civilized, but slack and listless. Of late years there has been a considerable immigration of Italians, chiefly from Sicily, and also of Maltese. The Sicilians are hard workers, and are employed not only in making roads and railways, but in building and here and there in the more skilled forms of agricultural labor. The Maltese, who are not less industrious and much quieter and more orderly than the Sicilians, conduct a good deal of the minor commerce and of the handicrafts. But neither race colonizes the soil or shows any sign of building up a domesticated peasantry. Still less do the French. France has no superfluous rural population; and though the life of her rural folk is hard and pinched, they are too much wedded to the spot of their birth and the habits of their forefathers to think of migrating to a country where they might easily better their condition. A few Frenchmen have bought and are working farms, but they work them entirely by native labor, with perhaps a Sicilian or two added. When a Frenchman comes, he comes, not to make a home, but to gather a little money and then return to France; he does not think of identifying himself with the country. Thus the native population remains unaffected by Europeans, except in the few towns, and even in the towns the distinction of religion raises an impassable barrier between the European and the Moslem. Not only is there no intermarriage, but there is no approximation in habits and ideas.

What the French have so far done is to make a number of roads (previously the so-called roads were mere tracks across the land), to construct several railways (a very great service to the country), to improve the ports of Tunis, Bizerta, and Susa, and to build at Tunis a new French town outside the ancient Moorish city. A stimulus has thus been given to trade, and the way paved for the development of the country, if either its own sluggish population could be stirred up or a new population induced to enter. That population, if ever it comes, will not come from France, and one is disposed to wish that the aspirations of Italy had been realized, and that Tunis had fallen to her instead of to her more powerful rival. Italy need not have drained her own too scanty resources, as she has done for her miserable colony of "Eritrea" on the Red Sea coast, for Tunis is able to pay its own way. She would have had no such formidable enemies as the Abyssinians have proved, and she might have repeopled the Tunisian territory with the overflow of her own peasantry, instead of seeing them drained off to New York and Buenos Ayres.

Of this there is now no chance. So far from having any idea of resigning Tunis, France regards it as a valuable point of vantage from which to obtain, when the Turkish Empire falls to pieces, the dominion of Tripoli. She is, moreover, anxious to get the trade of the Sahara into her hands. At present this trade, which crosses the Desert in caravans from the negro states north and northeast of Lake Tchad, goes by way of Murzuk or Ghadames to the port of Tripoli. The French desire to bring it to Sfax, or Gabes, or one of the other South Tunisian ports, and have thrown out posts into the Desert in the hope of effecting this. Their ambition is to control the whole of North Central Africa from the upper Nile to the Atlantic, and thereby to control also the negro kingdoms which lie south of the Sahara, between it and the territories under French influence in the northern basin of the Congo. These are far-reaching schemes, and witness to that strange passion for expansion which has laid hold of the European nations, which has induced the Germans to spend large sums on their unhealthy and unprofitable colonies in East Africa and Southwest Africa, and has made the English occupy the almost equally unprofitable regions round the great Nyanza lake—Uganda, Kavirondo, and Unyoro. One African country remains unappropriated, for which there will some day be a great struggle, because it has an almost temperate climate, a rich soil, an admirable situation. This is Morocco. France has long had her eye on it, and would gladly appropriate it, but for the apprehended resistance of Spain and England. It would be a valuable possession to England, but England knows that France and Spain would stand in her way. Thus, while all the rest of Africa, most of it worthless, has been parcelled out among three or four European Powers, the part nearest to Europe and most attractive in itself is reserved for barbarism and misgovernment of the worst kind by the jealousies of three nations.

Sooner or later, however, Morocco, like the rest of North Africa, will be brought within the widening circle of European civilization. The more interesting question which remains doubtful is whether in any of these North African countries civilization and Christianity will lay hold of the mass of the population, either by a social change worked upon the existing inhabitants from above, or as the result of an infiltration of European immigrants. So far as Algeria and Tunis are concerned, this process has not yet begun. French influence has not effected, and shows little sign of effecting, for the people what Punic influence, and afterwards Roman influence, did for the aboriginal Berbers twenty-five centuries ago. The difference between the stages of culture at which the conquerors and the conquered stand is too great, and Mohammedanism resists foreign influences to an extraordinary degree. A Mussulman population sometimes vanishes silently from a country. It has vanished from Rumania and Servia, and is fast vanishing from Bosnia and Bulgaria. But there seems to be no instance in which it has abjured Islam, and thereby opened itself to receive the impress of modern Europe. Be this as it may, the fortunes of Africa are now, for as far as we can see into the future, linked indissolubly with those of the great European states; and the complexity of the ties is shown by such a fact as the influence which a remote Power like Russia has been trying to exert upon the Abyssinian kingdom.

C. E.

Correspondence.

TEN BRINK'S TRANSLATOR.

To the Editor of The Nation:

Sir: Perhaps we may be excused for imposing upon you and your readers a "plea in extenuation" of our responsibility for the translation of the third volume of Ten Brink's 'English Literature,' criticised in your issue of to-day. We selected the translator for only the first volume. Professor Kennedy's lamented death led to the translation of the others being arranged for in Europe independently of us; only the third, however, was intrusted to the translator whose work you criticise unfavorably. We printed it from the English plates without taking proofs.

The hasty consideration which we have been able to give to your reviewer's criticisms suggests that good judges might differ regarding some of them. We do not wish, however, to take the time to get the translator's defence from England before letting your readers know the limits of our responsibility.

Respectfully yours,

Henry Holt & Co.

29 West Twenty-third Street,
New York, February 4, 1897.

FOR THE NONCE, "*PURPOSELY*" AND THE LIKE.

To the Editor of The Nation:

Sir: Hardly was it to be expected that, as results from substantiating the definition which heads this letter, the information regarding *for the nonce* supplied by English dictionaries of recent days could be shown to be deficient. Among the several senses of the phrase about to be considered, let that first be taken which is strictly antithetic to *accidentally, casually, fortuitously.*

To determine how early this sense of it appeared demands, no doubt, farther research. At present it is ascertained that, as exemplified below, the phrase, modifying a finite verb, and meaning "purposely," had some vogue just before the accession of Henry the Eighth:

"Some other beggers, falsely, *for the nonys*
Disfygure theyr children, god wot unhappely,
Manglynge theyr facys, and brekynge theyr bonys,
To stere the people to pety that passe by."
—Rev. Alexander Barclay, *Shyp of Folys* (1508), vol. i., p. 304 (ed. 1874).

A little later, in his *Cronycle compyled in Latin*, a translation of Sallust's *Jugurtha*, Barclay twice renders *consulto* by *for the nonest, for the nones*, namely, in fol. 51*v* and 71*v*. The first edition of the *Cronycle*, undated, is here referred to.

The subjoined quotation is likewise in point:

"My reasons and authorities of purpose are commonly taken out of their own doctors and writers, and such books as are not counted protestants, nor made by any of this new learning. *For the nonest* I forbare to allege the learneder sort, lest the unlearned should say they could no skill on such books, nor knew not whether they were truly brought in." Bp. James Pilkington (1563), *Works* (1842), p. 643.

Again, Richard Bernard, translating Terence in 1598, Englishes his *de industriâ* and *deditâ operâ*, in the *Andria* and in the *Eunuchus*, respectively, by *for the nones.*

Illustrations of *for the nonce*, employed, by distinct implication, to the same effect as above, but with specification (in the subsequent context) of what is purposed, are the following:

"A cook thei hadde with hem *for the nones*
To boyle chyknes and the mary bones,
And poudre marchant, tart, and galyngale."
—Chaucer, *Canterbury Tales, Prologue* (about 1390.)

"Thai war assemblit *for the nanis*
The gret gammis Circenses for to se."
—Bp. Gavin Douglas (1513), *Works* (1874), vol. iii., p. 196.

"The bischoppis all, and mony abbot, also,
Into the tyme, with vther lordis mo,
Convenit all togidder *for the nanis*
Of Sanct Margaret for to translait the banis."
—William Stewart. *The Buik of the Croniclis of Scotland* (1535), vol. iii., p. 105, st. 45, 930 (1858).

"Mee thinke, also, I haue read that Iulius Cæsar ware *for the nonce* a garland of Laurell, to hide his baldnesse withall." Sir Thomas Hoby, *The Covrtyer of Covnt Baldessar Castilio* [Baldassare Castiglione] (1556). sig. K ii. *r.* (ed. 1577).

In the first quotation, pointed otherwise, *for the nones* is clearly taken, by Dr. Richardson, in his *Dictionary*, to denote "for that purpose," "for the purpose aforesaid," and not as construable with *To boyle*.

Differently, in an author noticeably more modern than those who have just been cited, the expression is emphasized, with *for* and a substantive annexed:

"Cordial Medicines are made *for the very nonce for the sick* (as the Sacrament, for sinners)." Rev. Edmund Hickeringill (about 1682), *Works* (ed. 1716), vol. ii., p. 122.

Curiously enough, *for the nonce*, to signify "purposely," "intentionally," is still current, but only among illiterate persons of advanced age, here in Suffolk; as in, "He jossed up agin me *for the nonce*: 't wan't a accident." Professor Joseph Wright, editor of the admirable *English Dialect Dictionary* now in course of publication, obligingly informs me that he has not traced this peculiarity, in living speech, to any part of Great Britain.

In old authors, it is moreover to be observed, *for the nonce* is often introduced with perplexing vagueness; seeing that, in various connexions, it is ostensibly convertible with *studiously*, with *voluntarily*, *deliberately*, *advisedly*, and even with *for a time*, and with *then*, *afterwards*. In many instances, also, it looks as if it were simply syllabic padding, to integrate a verse; it being, so far forth, comparable with *bedene*, *iwis*, *mid iwis*, which, in distant days, were, not seldom, merely chiming expletives. In support of most of these conclusions, the evidence now to be offered might be multiplied tenfold from materials before me:

"Weyl were hyt do rygt *for the nones*
To wurschyp swych cherlës bones.
What wurschyp shulde men make
About swych cherlës bodyes blake?"
—Robert Mannyng, *Handlyng Synne* (about 1303), p. 269, v. 8691 (1862).

"And eftyr, quhen thai [Romulus and Remus] worth men, thai becam, *for the nanys*, briggantis of the wod." Bp. Douglas (*ut supra*), vol. ii., p. 291.

"Than the knightes couched their speares, and ran at thē with all their force; and the flemynges opened and gaue them way, it was sayd *for the nones*, and fledde, and sayde amonge themselfe, let vs flye and gyue them way, for we are sure the bridge wyll nat beare thē." Lord Berners, *The Cronycle of Froissart* (1523), vol. i., p. 717 (ed. 1812).

"A peyne y suffre harde, *for the nones*,
For a clothe that y refte ones
Of a pouerre man wythoute rygt."
—Robert Mannyng (*ut ante*), p. 73, v. 2263.

"Syne kingis com, amangis quham *for the nanis*
Stern Tibris regnit, a man byg of banis."
—Bp. Douglas (*ut supra*), vol. iii., p. 174.

"Sammyn wyth this vprisis *for the nanis*
Ane huge nois and clamour all atanis."
—*Ibid.*, vol. iv., p. 113.

"Blessed shall he be that *for the nones*
Shall throwe thy chyldren agaynst the stones,
To brynge the out of memorie."
—Bp. Myles Coverdale (before 1539), *Remains* (1846), p. 572.

"To saif Mankynde, that was forlorne,
Christ bure ane creuell crowne of thorne;
The Pope, thre crownis, *for the nonis*,
Off gold, pouilderit with pretious stonis."
—Sir David Lindesay (1552), *Poems* (ed. 1865–'71), p. 148.

In the oldest quotation of this group, a Norfolk knight, whose cattle have befouled the graves in a churchyard, replies, ironically and irreverently, to a bondman who complains to him of their misdoing.

Only the first three of the immediately preceding quotations, with those produced higher up, am I now able to bring forward from literature, to vouch, unchallengeably, for "purposely," and words either virtually, practically, or approximately, synonymous with it, as senses which have been borne by *for the nonce*. Nevertheless, the paucity of those testimonies is owing, without doubt, to my having neglected to make memorandums of others, when they were observed. With respect to the leading sense adverted to, though a good number of lexicographers pretty certainly went on recording it after it had ceased to define the phrase in any but an archaic acceptation, or in one no longer standard, it must have been, for a considerable period, prevalent, and have continued to be familiar to the learned. This position is established without difficulty.

Deditâ operâ, *de industriâ*, *consulto*, *tout exprès*, *à dessein*, and the like, are the interpretations of *for the nonce* given in more than a dozen old dictionaries—even down to Ainsworth's in the edition of 1828—that have been examined, not one of which, strange to say, recognizes it as interchangeable with "for the occasion," "ad hoc," the usual signification attaching to it all along, uninterruptedly, and attaching to it as an item of popular diction, though Dr. Johnson, in his haste, constructively pronounced it to be "not now in use." Thus, Bp. Thomas Cooper, of the era of Queen Elizabeth, has: "De industriâ aliquid facere. Cic. To doe of purpose or *for the nonce*," and "Deditâ operâ. Cic. Purposely, *for the nones*, of set purpose." Rider, Florio, Minsheu, Francis Holyoke, Miége, Littleton, and William Robertson, with others, might be adduced to the same purport. Skinner, in his *Etymologicon*, makes *for the nonce* equivalent to "serio et de industriâ," and then, going off at score, indulges in the fantastic and nebulous exposition: "Dicimus enim *To do a thing for the nonce*, cùm compendio rem peragere conamus, et caput rei petimus." In passing, Howell's Italian for the locution, *industriosamente*, "laboriously," or "craftily," does not suit with his French for it, *expressement*.

Ruddiman, in the glossary prefixed to his edition of Bp. Douglas's *Æneis*, has: "For the nanis; *for the nonce*, for the purpose, on purpose." Hearne, glossing, in 1725, Robert Mannyng's *for the nones*, *for the nons*, equates it to "de industriâ, operâ deditâ," and to "designedly, on purpose." Jamieson, in his *Etymological Dictionary of the Scottish Language*, adds nothing, touching *for the nanis*, to what may be gathered from his predecessors.

In a discussion wider of scope than this, notice would have to be taken of *with the nones that*, found at least twice in Chaucer, and of much besides which has not been touched upon.

Of the divers crazy guesses, as to the origin of *for the nonce*, which have been put forth, there is an ample detail in both of Archdeacon Todd's editions of Johnson's *Dictionary*, but not a single glimmer of real light. Yet neither Messrs. Halliwell and Wright, in 1859, nor Dr. Richardson, so late as 1865, should have been unacquainted with the interesting discovery for which the credit belongs to Mr. Richard Price. Thanks to him, we now know that the phrase, in the antique forms of which the *n* of *nanes* is provectional, began from *for than anes*, *for then ones*, etc., "for the one," that is to say, "for the special occasion or purpose." Skinner, and his successors for a long period, as well, were unaware of the existence of *for then anes*, occurring, as elsewhere, in *The Liflade of St. Juliana;* and yet, possibly, they would have dispensed with blind conjecture, and theorized to good effect, if, while bearing in mind the old *nale*, *nanger*, *neyes*, *nother*, *nown*, *nuncle*, *the tone*, *the tother*, and so on, they had fallen in with and pondered the ensuing passages:

"Then the emperor was content *for that once*, and bade they should no more do so, but that the old ordinance ought to be kept." Rev. William Tyndale (1530), *Expositions and Notes* (1849), p. 266.

"Yet wil we so terme it *for this once*." Sir Thomas Hoby (*ut ante*), sig. H 5*r*.

"Fiue or sixe . . . plotted a solemne drinking at one of their houses, laid in Beere *for the once*, drunke healths in a strange manner, and died therof within a fewe weekes, some sooner and some later." Rev. Samuel Ward, *Woe to Drunkards* (1622), p. 28 (ed. 1627).

Nonest has been seen above; and Robert Greene, in his *James the Fourth*, has *nonst*. In these, *nones* is "corrupted by form-association with superlatives." Of the same character are *against*, *alongst*, *amidst*, *amongst*, and *anenst*. F. H.

MARLESFORD, ENGLAND, January 15, 1897.

Notes.

HENRY HOLT & Co. have in preparation a series of Lives of the Great Explorers, by well-known writers.

The New Amsterdam Book Co. announce 'Moltke's Letters to his Wife,' in two volumes; 'Reminiscences of a Yorkshire Naturalist,' by the late Prof. W. C. Williamson, edited by his wife; 'Animal Episodes and Studies in Sensation,' by G. H. Powell; 'How We Made Rhodesia,' by Maj. Arthur Glyn Leonard; 'A Narrative of the Boer War,' by Thomas Fortescue Carter; 'The Highland Brigade in the Crimea,' by Lt.-Col. Anthony Sterling; 'The Court of England under George IV.'; and 'From "The Bells" to "King Arthur,"' a critical record of the first-night productions at the Lyceum Theatre, London, by Clement Scott.

Fleming H. Revell Co. issue during the present month the Autobiography of the late Dr. Charles F. Deems, supplemented with a memoir by his sons.

Charles Scribner's Sons promise 'America and the Americans,' from a French point of view; 'American Lands and Letters,' by Donald G. Mitchell; and 'The Builders, and Other Poems,' by the Rev. Dr. Henry van Dyke.

'A Primer of Psychology,' by Prof. Edward B. Titchener of Cornell, will bear Macmillan's imprint, as will also Dr. Henry Sweet's forthcoming 'Students' Dictionary of Anglo-Saxon.'

'Christian Citizenship,' by Dr. Carlos Martyn; 'Hero Tales from Sacred History,' by Dr. Louis Albert Banks; and 'The Epic of Paul,' by William Cleaver Wilkinson, are announced by Funk & Wagnalls.

'Walks and Rides about Boston,' by Edwin M. Bacon, author of the admirable Dictionary of that city, is to be published by Houghton, Mifflin & Co.

Copeland & Day will issue 'Miscellaneous Odes,' by Francis Thompson; 'Memorial Day, and Other Poems,' by Richard Burton of Hartford; 'A Book of Lyrics,' by Father Tabb; and another volume of verse by John Vance Cheney.

Way & Williams, Chicago, have nearly

ready 'Hours with Famous Parisians,' by Stuart Henry.

A limited edition of 'The House of the Heart,' poems by Irving Brown, formerly editor of the Albany *Law Journal*, is in the press of the Peter Paul Book Co., Buffalo.

The American Baptist Publication Society have nearly ready 'Christianity and Property,' by Dr. A. E. Waffle, and 'The Conservative Principle in Our Literature,' by Dr. William R. Williams.

The Pennsylvania Institution for the Instruction of the Blind purposes to reprint in raised characters, for the use of its pupils, Mr. David A. Wells's little book, 'Robinson Crusoe's Money,' which is well known for the good service that it has done in educating the mentally blind as to what constitutes good money.

The Delegates of the Clarendon Press, Oxford, have determined on a standard and uniform series of Greek and Latin authors from the best manuscripts, for use in schools, colleges, and universities, and edited by the first English scholars.

Volume viii. of Mr. Charles Booth's 'Life and Labor of the People in London' (Macmillan) continues the classification of the population by trades, and contains also a "Picture of Pauperism" which resembles that drawn in 'The Jukes' by our countryman the late Richard Dugdale. Volume ix. and last of this great work is to appear presently; it will contain a summary and analysis of the previous volumes, and will also deal with the conclusions to be drawn from the whole inquiry.

Of service to lawyers is 'Bender's Lawyers' Diary and Directory for the State of New York,' for 1897 (Albany: Matthew Bender). Some sixty pages more of matter than in last year's issue testify to the publisher's intention to make it as comprehensive as possible.

Mr. Stopford A. Brooke's 'English Literature' (Macmillan) is the best small manual of the subject that we have seen. In 250 pages Mr. Brooke gives a clear and eminently readable sketch of the whole material, from the seventh century to the middle of the nineteenth. Furthermore—and in this point he does not resemble some other writers of handbooks—he proceeds on the basis of a really intimate acquaintance with a large part of the field. It is easy to pick flaws, and we have noted a number of errors and omissions in matters of detail; but, on the whole, the book is admirably fitted for its purpose.

Mme. Darmesteter (Miss Mary Robinson) has translated, under the title of 'English Studies,' a number of essays by her late husband, the lamented Orientalist, James Darmesteter, which have to do with English literature and kindred matters. Darmesteter's versatility was surprising, and his feeling for life and literature was keen and fresh to a degree not always found in men of his erudition. He knew the English mind and character well, and whatever he had to say about it deserves attention. The volume before us, then, is worth reading, though the papers it contains were not meant for immortality. Their "occasional" character is, of course, no drawback to the "occasional" reader, for whom, indeed, they are primarily meant. There is a touching preface by the translator, and an excellent portrait of the author adds to the attractiveness of the book.

Everybody yields to the charm of Mr. Austin Dobson's 'Eighteenth Century Vignettes,' and everybody will therefore be glad to see the third series of them, which is now on our table (Dodd, Mead & Co.). There is no falling off in the interest, no lack of spirit and variety. Mr. Dobson is an unsurpassed artist in minutiæ. He takes infinite pains with trifling details of manners or letters, not because he exaggerates their importance in themselves, but because he has a just sense of what they mean in their relation to the century as a whole. His talent in extracting diversion and enlightenment out of anything and everything—an old catalogue, for example, of a not very remarkable library—is remarkable. We have nothing but commendation for this new volume, which, we take it, does not contain more than half-a-dozen dull lines.

Hertz's "Miscellaneous Papers," of which we have a translation by the hands of D. E. Jones and G. A. Schott (Macmillan), form the first volume of the collected works of this brilliant investigator as edited by his friend and pupil, Dr. Philipp Lenard. They number twenty-two, most of them on the earlier investigations which Hertz carried out before the great electrical researches by which he is best known. To these are added the Heidelberg lecture "On the Relations between Light and Electricity" of 1889, his tribute to his great master, Helmholtz, 1891, and his investigation "On the Passage of Cathode Rays through Thin Metallic Layers," 1892. These last, and the research, "Experiments on the Cathode Discharge," are the papers which have the widest interest. In an introduction of seventeen pages Dr. Lenard gives a very interesting sketch of Hertz's scientific career up to the time of his epoch-making discovery of the electric waves. In 1877, at the age of twenty, he went to Munich to carry on the engineering studies to which he had decided to devote himself; but at this point he began to doubt whether his natural inclination lay in this direction, and soon determined to turn to physics. A year later he went to Berlin to become the pupil of Helmholtz and Kirchhoff. There he remained, the latter part of the time as Helmholtz's assistant, until his removal to Kiel as privat-docent in 1883. Immediately on his arrival in Berlin he was led to attempt the solution of a problem in regard to electric inertia which had been proposed as a prize research, and was successful in winning the prize and the high commendation of the faculty. In 1880 he took his degree. His prize research and his inaugural dissertation are the first and the longest papers in this collection. Much interest is added to the brief narrative by extracts from his letters to his parents during this period of his life.

Prof. A. Cartault's 'Étude sur les Bucoliques de Virgile' (Paris: Colin) is an interesting and original book of 500 pages written on the high lines of literary criticism of the classics in which the French excel. Of its thirteen chapters, the first deals with the youth, the patrons, and the friends of Virgil; the second is a study of the chronological order of the Eclogues; the next ten are devoted each to a single eclogue; and the last treats *les réalités rustiques* in Virgil's Eclogues and in the first eleven Idyls of Theocritus. The main object of the book is to set forth what can be exactly discovered about the youth of Virgil, and to study the formation of his poetic talent. The author investigates carefully the poet's studies and his sources, and shows how Virgil used these sources, sometimes translating almost literally, again imitating freely, now departing so far from his models as to produce what is practically an original work. To follow Virgil as his genius developed and as he grew year by year more sure of himself and of his own inspiration, is a fascinating pursuit, and the book will commend itself to every lover of the great Roman bard.

How much may be made of a dry subject is well shown in Lee Phillips's 'Virginia Cartography,' forming No. 1039 of the Smithsonian Miscellaneous Collections. Mr. Phillips gives a list of such maps of Virginia as he has met, and a full history of each one, making an invaluable guide to his subject. The list is a long one, beginning with the 1585 map of John With or White, who has been identified with John White the Governor by Kohl and Stevens, but contrary to the record, as Mr. Phillips has good reasons for believing, and ends with the latest railroad map by an American house. Of John Smith's map, to which high praise is justly given, four impressions are described, and much attention is given to the map of Virginia Farrer, one of the few examples of woman's handiwork in that line. From Smith to Jefferson and Fry only one map became acceptable as a standard, that of Herman, the founder of Bohemia Manor, who made the drawing in 1670. Of interest is the note on the map appearing in the English edition of Washington's Journal in 1754, which Mr. Phillips traces to the *London Magazine*. It is natural to find that the French war (1755–1763) and the Revolution (1774–1783) stimulated the issue of maps by English and French, some of which deserve to take very high rank as examples of artistic map-making. Mr. Phillips is entitled to great credit for his labors, which will be useful to every American library. The proof-reading has been carelessly done, as not a few typographical errors are to be found.

The Consular Reports for January are largely taken up with an account of land taxation and labor laws in New Zealand. This is in response to "many hundreds of letters" of inquiry received by our consul at Auckland within the past two years from intending emigrants from the United States to that country. The terms on which land can be obtained are reasonable, but the cost of clearing it, the lack of a local market, the poor roads and the small profits on shipments to England more than offset this advantage. The consul at Barcelona reports that during the season of 1896 "there were 478 bull-fights in Spain, and 1,218 bulls and 5,730 horses were killed." The value of these animals and the wages of the twenty-three matadores were about three-quarters of a million of dollars. The most famous of the matadores, Guerrita, "appeared in sixty-eight fights, killed 174 bulls, and received in all $51,000."

The ninth report emanating from the Massachusetts Commissioner of Public Records shows that Rhode Island has followed in the wake of its neighbor State, and that Connecticut is likely to come next. Mr. Swan for the first time makes a complete tabular statement of what has been achieved by his office in the preservation of municipal records since 1890. It is a very remarkable proof of efficiency; but Mr. Swan still advocates a public-record office. He has another amusing chapter on the overburdened town clerk and his miserable compensation (when there is any). The craze for genealogical research, it seems, is now increasing his burden, but not his fees. Were he held responsible for non-performance of every duty exacted of him by law, every clerk's office in the State would stand vacant. In reference to binding, Mr. Swan points out the superiority of canvas to leather, as resisting damp, heat, or fire (even in a safe); and

as Pennsylvania has legalized typewritten records, he warns imitators that ribbons charged with permanent ink should be insisted upon.

From the seventeenth annual report of the New York Free Circulating Library, it appears, by actual observation in April last, that in history, biography, and travels a larger percentage of works (mostly juvenile, doubtless) is taken out by children than by adults. The library has begun a sort of card-catalogue of criticisms "clipped from the current literary magazines which were formerly sold for old paper," to be accessible to the public. Books, too, hopelessly worn out are no longer sold as waste, but are devoted to the city asylums and prisons. These economies remind us of the use of the discarded leather coverings of car-seats on the Baltimore and Ohio Railroad for bookbindings in the travelling library maintained by that road.

The past month ushered in the Bulletin of the New York Public Library, a most interesting document. It gives a succinct account of the origin of the several Astor, Lenox, and Tilden foundations, their status in funds and volumes at the close of the year 1894, and of the steps taken for consolidation and the procuring of a site for the new building. The Tilden endowment, estimated at $2,000,000, is about twice that of the Astor, which is again twice that of the Lenox (apart from a life interest yet pending). The Director, Dr. John S. Billings, tells of the vigorous measures initiated, since his accession, at both the existing libraries, for shelving and cataloguing, supplying books of reference for free consultation, and making periodicals subscribed for available before binding. He also enumerates the more important gifts of the past year, three of the items coming from England.

The gratifying announcement is made in the *Library Journal* for January that the 'American Catalogue' for 1890-'95 is ready for the binder. The same number contains the proceedings of a recent meeting of the New York Library Club with the New York State Library Association, at which the best books of 1896 were discussed in classes by several reporters. In the juvenile field, according to Miss Hewins, no very good book had been produced—"that is, no book worthy to be put into the A. L. A. selected list."

Following the *Zeitschrift für Schulgeographie* that has been established for a number of years in Germany, the first number of a *Journal of School Geography* has just been issued under the editorship of Prof. R. E. Dodge of Teachers' College, New York, in association with Mr. Hayes of the United States Geological Survey, Prof. Kümmel of Lewis Institute, Chicago, Prof. McMurray of the Buffalo School of Pedagogy, and Prof. Davis and Mr. Ward of Harvard. "Each of the editors is a worker in geography, either as an investigator or teacher, or both. Every one is now teaching or has taught; all have to do with the problems of the schools; and several are making these problems their chief study." In spite of the number of periodicals now issued, and of the considerable number devoted to the general interests of secondary education, there is a distinct need of a special journal covering the field here entered. The first number contains several articles giving a variety of practical counsel and information, both helpful and useful to teachers. Subscriptions ($1.00 a year) may be sent to the publishers, 41 North Queen Street, Lancaster, Pa.

The *Annales de Géographie* for January contains an article on the transcription of geographical names, with especial reference to Russian, and a description of the geographical divisions of Brittany. In an interesting account of the different projects for increasing the navigability of the Loire, attention is called to the steady decline of the cities on its banks in industries and population. Nantes, for instance, which, a century ago, was the first port in France, is now the twelfth in rank. This is due largely to the fact that for two-thirds or three-quarters of the year the difficulties presented by the shifting channel and low water are so great as practically to close navigation. There is also a study of the characteristics of the races inhabiting the valley of the upper Nile, with an ethnographical chart, and an encouraging review of the success of the new methods of agricultural instruction introduced six years ago into the primary and grammar schools of Belgium.

Among the contents of *Petermann's Mitteilungen* for December is a story of exploration in northeastern Iceland, and a lively description of Erzerum and Trebizond. Erzerum Dr. Saad calls a "city of the dead" from the appalling misery of its inhabitants since the massacres. The annual summary of geographical literature for the year shows a considerable falling off from that of 1895. Europe holds the first place with nearly a third of the 801 works noticed, and is followed at a long distance by America, Asia, and Africa. There are supplemental numbers on the geological results of recent explorations in Central Asia and China, and (by Dr. Karl Dove) on the topography, climate, flora, fauna, and resources of South Damaraland in German southwest Africa. This country apparently has little mineral wealth, and the soil is too poor to sustain a large population, while to buy grazing land and stock a ranch—the only profitable industry—would require a large outlay of capital from which there would be no return for ten years.

The principal article in the Quarterly Statement of the Palestine Exploration Fund is Dr. Bliss's report of his excavations in Jerusalem. The extent of his work may be realized from the fact that during the past year he has opened a mile of tunnels. The dimensions of the true Pool of Siloam have been determined, and the ruins of an ancient church on its north side have been discovered. Mr. Gray Hill begins an account of a successful journey to Petra in 1896, and there is an interesting description of a visit to the cave of Machpelah in Hebron, by a Jew in 1523, with comments by Canon Dalton, one of the very few Christians who have been permitted to examine the interior of the mosque built over the cave.

Cosmopolis, the triglot review, is about to become in certain countries a tetraglot. Henceforth in Russia there will be annexed to the present French, German, and English divisions a Russian part. A like experiment will soon be tried in Italy and in Denmark, where the subscribers of the review will find in each month's issue an Italian or a Danish addition. The main body of the review will remain as it is, constant, but there will be special editions for circulation in certain countries, with a supplement in the vernacular of each of these.

For many reasons unusual interest has attached to the efforts of the friends of Colorado College to raise the $150,000 necessary to secure the conditional gift of $50,000 by Dr. Pearsons of Chicago. His offer was made just before the panic of 1893—a panic which reduced many of the local benefactors of the college to comparative poverty, and which aroused such manifestations of feeling in Colorado towards the Eastern section of the country as might have seemed to a cynical observer sufficient to quench the very spirit of benevolence. In spite of these adverse conditions, and although the revenue of the college was seriously affected, the faculty and students by their devotion and self-sacrifice encouraged the friends of the institution to renewed efforts, which have finally been crowned with success. The number of contributors to the fund surpasses 1,000; and more than $100,000 has come from donors in the Eastern States. Independently of the great work which a college situated as this one is has to perform—it is not aided by the State Government—and which itself constitutes a patriotic appeal, it certainly seems as if no more impressive lesson to the promoters of sectional prejudice could be given than the generosity with which benevolent people from all parts of the country have responded to this appeal.

—A noteworthy incident in the preparation for independence is followed out in the *American Historical Review* for January by Andrew McFarland Davis, who sets forth the case of Frost vs. Leighton. The matter came before the Superior Court of Judicature of the Massachusetts Bay, which, by a decision rendered in 1738 and repeated in 1739, "refused to enforce an order issued by his Majesty in Council, because the powers of the court derived through the charter and the laws passed to carry the same into effect, were, in the judgment of the court, inadequate for that purpose." The case is as interesting as it is historically important. Gaillard Hunt contributes an amusing and instructive article on office-seeking during John Adams's Administration. Adams's sentiments about appointments were high toned, but certainly modified in practice at a time when "offensive partisanship" was much more common with Federal officials than now. In other respects, this generation may recognize itself in these century-old documents from the State Department. The American field is also well cultivated by Joseph S. Walton in "Nominating Conventions in Pennsylvania," and by Frederick W. Moore in "Representation in Congress from the Seceding States 1861-'65," a first paper, "limited to the cases in which the respective houses of Congress judged the qualifications of applicants for membership from the States in insurrection," and designed as an introduction to the difficult subject of Reconstruction. Among the Original Documents are Marshall's letters to Washington when Envoy to France, and Cobden's letters to Sumner during our civil war. These last, with some lack of insight, are able comments from an outsider friendly to the North, but who would have tolerated both the economic and the moral enormity of slavery rather than support a war for abolition—who, in fact, might have been a pacific member of the Peace Congress on the eve of hostilities. Much of his criticism may still be taken to heart. "I wish," he writes on January 11, 1865, "I could see more intelligence in your midst on questions of finance and political economy. Your Congress seems to me just about on a level with the British Parliament of 1818, before Huskisson commenced his first reforms of our fiscal system which were afterwards followed up by Peel and Gladstone." And on March 2: "The country is revelling in a saturnalia of greenbacks and Government expenditure, and

is under a delusion that it is a genuine prosperity. It is destined to a rude disenchantment, and this will test the statesmanship of the Republican party." In thirty-two years, except for resumption of specie payments, we have not budged an inch!

—Mr. C. H. Firth prints, in the January number of the *English Historical Review*, Thomas Scot's account of his actions as "intelligencer" during the period of the Commonwealth. Scot entered the Long Parliament in 1645, sided with the Independents in the struggles of 1647 and 1648, and was one of the judges who condemned Charles I. He strongly opposed the Protectorate, and in his confession pronounces Cromwell "one of the greatest tyrants England ever saw or felt." In January, 1660, Scot became Secretary of State, but, after the readmission of the members who had been excluded in 1648, he took refuge in the Netherlands, where he was shortly afterwards induced to surrender; on October 17 he was executed. He held the office of intelligencer from 1649 to 1653, and in 1659 was reappointed; but his confessions, which he seems to have been led to believe would save his life, appear not to have been thought important enough to protect him. His account, however, throws considerable light upon the foreign and domestic intrigues of the time, and is enlivened by naïve characterizations of those whom he employed as tools. One of his first acts was to inform himself of the doings and plans of the Levellers, with the result that four of them were soon imprisoned. He held weekly correspondence with Cromwell while the latter was in Ireland, meantime keeping agents actively employed in Scotland. Werden, his principal agent in France, "played a double game," and later, instead of keeping his promise to "renew his correspondence & discoverys" at Brussels, became a leader in Booth's rising. Another emissary, Lewis de Bourgoigne, travelled from Calais to Bordeaux, working among the adherents of the Prince of Condé as the ones most likely to favor the English "had there been occasion ministred of attempting them by land." A correspondence with Cardinal de Retz came to nothing. The threatened intervention of the Duke of Lorraine kept Scot busy, not only in Flanders, but especially in Rome, where some of the Cardinals with whom his "instruments" had influence "were led to beleeve that G. Cromwell was much disposed to a liberty of Religion, if not formall tolleration of Popery, and would much incline the Parliament thereto, and therefor that it was not safe to provoke either." In the end, the Duke failed to obtain the aid and "spirituall benediction" he desired. The agent set to watch Lilburne in Holland was unsuccessful, for the reason, so runs the confession, that "John's genius was too mighty for him." Scot knew, chiefly by means of intercepted cipher dispatches, of the progress of negotiations between the King and the Presbyterians; but a proposition to betray the King into his hands he "peremptorily and in a few words renounc'd," as "unsuitable to Christianity." When the army turned against the Parliament, in November, 1659, Scott committed to Col. Bampfield the task of reconciling him to the King; but of the outcome of the mission, or whether, indeed, it was ever seriously undertaken, he never knew.

—No great name of the first rank appears in the 49th volume of the 'Dictionary of National Biography' (Macmillan). Nevertheless, there is plenty of fame between the two covers, from Robinsons (filling 57 pages) to Russells (filling 68), and a deal of interesting reading. The American contingent is rather small—John Rolfe, Mary Rowlandson (the Indian captive), the Rev. Ezekiel Rogers of Rowley, Mass., and John Robinson, the Pilgrims' pastor before the exodus from Leyden, whose autograph signature is preserved in a book in the British Museum. We might add Gen. Ross, who burnt the capitol at Washington in the war of 1812, for which his biographer supplies approval rather than extenuation. Under John Robinson, we observe (p. 21) a faulty first initial ("W.") for the late Dr. Henry M. Dexter, a Puritan apologist who agreed with Dr. Palfrey in deducing a nominal flogging of Obadiah Holmes in Boston in 1651 from the victim's exalted account of his feelings, as if "struck with roses." The same logic would make the burning of the martyr Rogers perfunctory, for we read on p. 129 of the Dictionary that his children (*teste* Count Noailles) comforted him "in such manner that it seemed as if he had been led to a wedding." Sir Boyle Roche's most famous bull is tacitly discredited by his biographer, who tells us that his speeches were prepared by others for his amazing perversion in delivery. The poet Rogers receives very amiable treatment, with good reason. We are reminded that Prince Rupert was one of the founders of the Hudson's Bay Company. Lord John Russell has hardly a better title to distinction than his eleven years' persistence in removing the Jewish disability to sit in the House of Commons on behalf of Lionel Nathan Rothschild, who, with his kindred, also figures at length in this instalment of the Dictionary.

—With volume iv. Mr. Conway brings to an end his edition of the writings of Thomas Paine (Putnams). There can be no question of the value of this edition, which takes a high place at once as the only complete collection of Paine, and largely because of the diligent labors of the editor. This volume contains the 'Age of Reason' and the controversies growing out of it. The original edition is made the basis of the reprint, allowing the correction of some curious errors that have crept into the text in the many reprints. The history of the work is well told by Mr. Conway, but he could not refrain from once more referring to the malice of Morris and the perfidy of Washington. Paine says so much in his own defence, as well as to his own injury, that it was unnecessary to seek so forced an explanation of the sufferings he endured in his struggles for free thought. Some political writings, of little value, and some interesting scientific papers fill out the volume. We doubt the expediency of printing the poetic attempts of Paine. They might be cited as evidence of his versatility; but they are poor stuff at best, and not above the level of the squib-writer of the day. Mr. Conway's notes are full, and usually in excellent taste, and he naturally places a very high estimate upon the services of Paine, whom he calls "the great commoner of mankind, founder of the republic of the world, and emancipator of the human mind and heart." A sentence in the introduction informs us that Mr. Conway intends to write a defence of citizen Genet, of whose career in America very little good can be said. It is difficult to believe that to such a crack-brained diplomat it was seriously proposed to intrust "Louis Capet" for transportation to America. Yet Mr. Conway thinks it was so.

—Gen. Nelson A. Miles's 'Personal Recollections and Observations' are published in small quarto by the Werner Co. (Chicago and New York) with all the attractions of the subscription-book of the better sort. The reproductions in full page of Remington's illustrations are very spirited and taking. The portion of the book which narrates Gen. Miles's personal and very important part in recent Indian wars is original matter of a high order, and is authoritative in the best sense. His keen and just perception of the true origin of the conflicts, and of the special character they take from the nature of the Indian, is most instructive. His references to Indian habits, morals, ideals, purposes, and standards of right are those of an expert whose sense of justice has made him take a kindly view of the red man, while he does not ignore the barbarism in which the race is still sunken. He adds his weighty testimony to that of leading military men who have gone before him, in saying that he has never known an Indian war in which the white man was not the aggressor. Wherever he touches the personal life of the Indian or of the frontiersman, his lines are true and firm—a graphic reproduction of his own experiences. The rest of the book is of much less value. The autobiographic outline is especially meagre in regard to the civil war, in which the author's career was a most brilliant one. The dissertation on aboriginal ethnography is neither a scientific treatise nor a popular sketch. It falls short of the one and is too full for the other. The picture of the development and progress of the West has too much of the quality of the guide-book or gazetteer. A less pretentious volume, consisting of the chapters on the author's own experience and observation of the Indians, would have a prominent place in every library, and, written as these are with the *verve* and strength of a competent man on ground which is his own, would give Gen. Miles a much better literary reputation than the bulky book as a whole is likely to make.

—Mr. Goldwin Smith's 'Guesses at the Riddle of Existence' (Macmillan) come to us as a welcome reminder of the fact that six and thirty years ago he encountered the redoubtable Dean Mansel on the battlefields of theological metaphysics, and added philosophic laurels to his chaplet by his attack on the famous Bampton Lectures, in which Mansel, in his anxiety to disarm rationalism, "inadvertently demonstrated the impossibility of believing in God" and became "an awful warning to the polemical tactician," as his former adversary takes occasion to impress upon Mr. Balfour. Mr. Goldwin Smith's attitude then was that of a liberal thinker, loath to give up the spiritual heritage of civilization, except under the stress of the more imperious demands of truth and sincerity; it has not changed since, though the march of events has put a more agnostic complexion on his views. His method also has remained the same, and his guesses at truth retain the form of criticisms of other people's guesses, as clear in thought and as felicitous in expression as of yore. With a sureness of touch and lucidity of statement which it would be well for professed philosophers to imitate, he exposes the hollowness of the current nostrums intended for the cure of our spiritual ailment; but of positive conclusion there is little or nothing. No one evidently regrets this more than Mr. Goldwin Smith himself: he sees trouble everywhere in the social atmosphere, and "the storm-centre of the trouble seems to be in the region of re-

ligion"; he sees also the source of the trouble, but nowhere a remedy. Yet he declines to declare himself an agnostic. He will not say, as so many, that the search for light on the riddle of existence must or should be abandoned, or that our perplexity makes no practical difference. And for that surely he deserves such thanks as Rome accorded to the vanquished Varro after his defeat at Cannæ—the thanks due to one who does not despair of the human reason and its satisfaction.

—Macmillan publishes a limited large-paper edition, of 500 copies, of Irving's 'Alhambra' with Mr. Pennell's illustrations, which contains, besides all the matter of the ordinary edition, twelve lithographs, by Mr. Pennell, of views in the old Moorish palace. In spite of the generous praise which Mr. Whistler has lavished upon these plates, we cannot think them unqualified successes, or that their presence is any great addition to the value of the book. Their size makes them unpleasant as illustrations, while their marginless state renders it difficult to judge fairly of their merit as independent works of art; but it seems to us evident that Mr. Pennell has by no means yet mastered the resources of an art that is new to him, and has tried to render by its means effects much more suited to his tried implement the pen. The charm of lithography is in the facility it gives for multiplied and soft half tones; it is essentially a *gray method*. The glitter of sunlight on sharp and complicated architectural forms demands the crisp incisiveness of the pen point for its suggestion. Mr. Pennell has tried to use pen-technique for the production of pen-and-ink effects with no better tool than the soft lithographic crayon, and the result is that his lithographs are a sort of weaker and woolly pen-drawings. Once or twice, indeed, there is a suggestion of the glow of light rather than the glitter; but, in general, the pen drawings in this volume seem to us much more successful renderings of the scenes attempted than do the lithographs.

—M. Eugène Müntz has written a sound and thorough monograph on the 'Tapestries of Raphael,' which is published, in a sumptuous limited edition of 330 copies, by J. Rothschild of Paris (New York: Brentano's). As M. Müntz is well known as an authority on Raphael and as an authority on tapestry, he was doubly fitted for the execution of his present task, and the work contains everything that is known concerning Raphael's tapestries and those which have been attributed to him. In one place we think he has made a slight slip, but he himself furnishes the material for its correction. In discussing the series of tapestries of playing children which Giovanni da Udine designed for Leo X., he demonstrates that these were twenty in number, but in reconstructing the list from all available sources the number seems to amount to twenty-one. It is evident that there is a mistake somewhere, and, after describing, from an old inventory, Nos. XIX. (Children with Paroquets) and XX. (Children with a Pheasant, or Children with a Woodpecker and a Partridge), he hazards the remark that "il est fort probable que l'une de ces deux pièces fait double emploi avec celles qui ont été décrites ci-dessus." It seems to us quite evident from the descriptions alone that the doubling is in another place, and the illustrations render it absolutely certain that Nos. XIV., a tapestry in the collection of the Princess Mathilde, and XXI., a drawing in the print-room of the Berlin Museum, are identical. In order to make his list tally, M. Müntz has but to omit his last number entirely and add the reference to the Berlin drawing to his No. XIV. The book is published in a large quarto, paper-covered, beautifully printed, and lavishly illustrated with nine plates on copper and 125 text cuts, and furnished with title-page, dedication, etc., in colors, and with rubricated initials. Two of the plates are etchings of Raphael's portraits of himself and of Leo X.; the other seven are the special glory of the book, being photogravure plates from the celebrated Hampton Court cartoons, which have now been photographed for the first time by special permission of the Queen of England, to whom the volume is dedicated. They do not all reach the highest level of execution, but they afford the best means, short of a trip to London, now attainable for the study of these works, while the minor illustrations take the place of study in half the capitals of Europe. Here is a veritable feast for the amateur of art.

—Some interesting legal questions have arisen in reference to the Goncourt bequest, and while there has been no intervention on the part of the natural heirs of Edmund de Goncourt, and no attempt to break the will, MM. Daudet and Hennique, the testamentary executors, have been in a good deal of doubt as to what was the best course for them to follow, and the foundation of the Académie des Goncourts has been considerably delayed. It was a philosophical and literary will that M. de Goncourt composed for himself, rather than one in strict legal form. He bequeathed his estate to a future academy which was, at the time he made his will, non-existent, having neither moral nor physical personality, and so being incapable of inheriting anything. This was pointed out to him by his notary, and he then added a codicil by the terms of which MM. Daudet and Hennique were made his universal legatees. There seems to be some doubt whether the courts may not hold that this is an evasion of the law, and it is said that there is some possibility that certain distant relatives of M. de Goncourt may raise the question, although nearer ones have declined to do so. But at any rate the sales of the Goncourt pictures and objects of art will go on as they had been planned. The first sale will take place on February 13, when will be offered the collection of drawings, about the value of which there have been so many conflicting reports. In the opinion of M. Georges Duchesne, who has charge of the sale, Goncourt himself was not mistaken in their value, and they will probably bring in the sum at which he estimated them. The second sale will take place on February 20, and will include the objects of art. Afterwards, at about the beginning of March, the Chinese and Japanese collections will be sold, and this will take at least an entire week. MM. Roger Marx, Bracquemond, and de Chennevière, in accordance with the wishes of M. de Goncourt, have arranged and classified these collections and made the catalogue of them. Two catalogues, in fact, will be published: one, a magnificent volume, with elaborate prefaces and illustrations, which will be sold at 40f.; the other, a résumé only, to be given away. Finally, in April, Goncourt's copyrights will be sold, and the well-known house at Auteuil, so that it is expected that the whole value of the estate will be in hand by the 1st of June, when, if no legal obstacles arise, the foundation of the new academy will be made.

HARPER'S CLASSICAL DICTIONARY.

Harper's Dictionary of Classical Literature and Antiquities. Edited by Harry Thurston Peck. Illustrated. Harper & Brothers. 1897.

THE plan of this work is truly encyclopædic. It aims "to give in a single volume the substance of all the information that it has hitherto been necessary to seek among many books and in many places." This information is classed in the preface under nine heads: biography, including the Christian fathers and the great classical scholars and philologists of modern times; mythology; geography; history; literature; antiquities, including public and private life, military, religious, and legal antiquities, music, philosophy, science, and epigraphy; language—including (among others) articles on Grimm's and Verner's laws—pronunciation, the *sermo plebeius*, dialects, and grammar; bibliography, brought down to the latest investigations; and illustrations.

Naturally, the book is a large one. It contains 1,700 pages of the size of Harper's Latin Lexicon (which is itself a work of a little over 2,000 pages). It is excellently printed in good type. The quality of the paper is well fitted to set off the 1,500 illustrations without being so shiny as to make reading a disagreeable task. At first sight one feels nothing but gratitude to Professor Peck for the labor which he has undertaken. As Livy remarked of his own work, *Res est immensi operis.* A book of this sort has long been needed, and this one will, we have no doubt, find a permanent place in every public library of importance and upon the shelves of a vast number of classical students and men of liberal culture. It is matter for great regret to us that we cannot add that it will be found completely trustworthy.

No one man's knowledge would fit him, in these days of specializing, to prepare a work of this magnitude. Prof. Peck has realized this fact to a certain extent, but not by any means fully enough. We do, indeed, learn from the preface that special articles have been written for the dictionary by twenty-six eminent scholars whose names are duly given; but examination shows that they contribute only about 131 pages, or less than 8 per cent. of the whole work. For the rest of it the editor declares himself solely responsible, and adds that he has devoted to it, for nearly five years, every hour that could be spared from other arduous duties. This period, even had it been entirely devoted to the dictionary, can scarcely be considered very long for such a task, and here again Prof. Peck has underestimated the seriousness of his undertaking. In spite of the numerous excellent hand-books and dictionaries, like those of Marquardt, Hermann, Göll, Lipsius, Blümner, I. Müller, Gilbert, Baumeister, Smith, Seyffert, and Schneider, the field is too great for one man to reap in any reasonable time, and the crop, while far from being in this instance a total failure, is yet foredoomed to disappoint the vows of the single laborer.

Everybody will be grateful for such articles as those on Umbria by Bücheler, Persia by Geldner, Pindar by Gildersleeve, India by Lanman, Homer by Seymour, and Lexicography by Lewis. Those on Ennius and the Senecas, Pompeii, Satire, Terence, Sermo Plebeius, and Grimm's and Verner's Laws, by Cruttwell, Lanciani, Pease, Ashmore, Cooper, and Wheeler, call also for special praise. Tarbell's archæological and architectural articles, too, are just what were to be expected

from his accurate knowledge and precise skill in definition. Of the articles by the editor himself, high commendation is to be given to those on Domus, Theatrum, Musica, and Balneum; and space will not allow us to chronicle his successes in details. Where so much has been done, and well done, it seems rank ingratitude to criticise severely; yet the editor's own acknowledgment that he knows his book to be open to charges of inconsistency and error, must not prevent us from indicating some of the faults which are to be found in it.

Next to a false reference to authorities, there are few things so exasperating in a dictionary as a false *cross*-reference. To refer the reader to a second and perhaps to a third article, and to furnish the promised information in neither, is a practical joke of a very disagreeable kind. This book is not free from such jokes. For example, under *Caricature* we are referred to *Pictura*, for *Hypogæum* to *Sepulcrum*, for *Timema* under *Diké* to the word itself, and under that to *Judicial Procedure*, and we get no comfort anywhere. Under *Pirene*, we are told that, according to one tradition, Pegasus struck out this spring on the citadel of Corinth, while under *Pegasus* it is said that the production of Hippocrene was the only connection of Pegasus with the Muses; for another tradition about Pirene we are referred to *Sisyphus*, where there is nothing whatever on the subject.

Of misprints the book is pretty free; we note Brune for Brunn in the preface, Rumfel for Rumpel under *Pindar*, 'Livy Epit. 140' for '142' under *Drusus*. Quantity seems to be marked only in cases where reasonable doubt might arise in the ordinary reader's mind, and the short and long marks are both used. It would have been better, perhaps, to mark only those penults which are known to be long. Why should we find *Patrŏcles* (the general), but in the very next article *Patroclus* or *Patrocles* (the hero)? And what is the evidence for *Cleopātra*?

Another needless aggravation is the frequent omission of the exact sources from which illustrations are taken. In these days the matter is easily settled, and every serious scholar wants to know the authority upon which a picture depends. "From a lamp," "from a cameo," "from a frieze at Rome," "restoration"—such indications are most unscholarly and all but useless. And while the editor has in general avoided the more common pitfalls—for example, we rejoice that at last in a reference book the student is warned against the old fraud called "the baths of Titus"—yet many will look with a good deal more than doubt upon a collection in which are included (without a word of caution) the three "portraits" of Horace here given. As for the cut called "Cleopatra, Painting on slate, from the Villa of Hadrian," Prof. Peck ought to have searched and learned that no genuine paintings have ever been found in this villa, and that the picture in question has been hawked for years about the museums of Europe and America, only to be repudiated. The right hand alone is enough to stamp the whole as a forgery. Many of the other illustrations are well executed, yet there are some outline cuts which are caricatures of the originals and merely serve to disfigure the book. Such, for instance, are the map of Italy, the cuts of the Venus of Milo, of certain coins, of a bust of Sallust, of the Roman wolf. In this time of photography and cheap process cuts there is not the slightest excuse for such crude performances, or for fancy pictures inherited, many of them, from untrustworthy books like Rich or the 'Museo Borbonico.' Publishers ought to be ashamed to serve up the old things over and over again.

Alma-Tadema's "Symposium" is reproduced in a rather poorly executed cut. The original itself is fair game for criticism, but this cut makes the two banqueters look like a pair of boozy tramps. On the whole, the admission of any modern pictures into a serious book on classical antiquity is a doubtful experiment, and certainly this particular choice was needless, since there are plenty of ancient representations of the symposium which might have been used. And if we *must* have a modern picture of Sappho, Cipollini's monograph would perhaps have saved Prof. Peck from another selection from the English school.

In the department of Attic legal antiquities the editor is far from being at his best. No bibliography is given under *Judicial Procedure* or under *Diké*, and there is much repetition in the two articles. The old edition of the 'Attischer Process' is cited under the latter; the revision by Lipsius under *Paragraphe*. Under *Anacrisis* (where the book is called *Prozess*), the explanation of διαμαρτυρία is incorrect; under *Metœci*, the statement is not true that with ἰσοτέλεια followed naturally the right to own land, since a separate decree gave this privilege. The definition of *Psephus* is not borne out by the accompanying illustration, and the cross-reference to *Diké* does not help at all.

Under *Tibia* and *Capistrum* the editor shows that he is not acquainted with Howard's treatise (the only one in English worth reading) on the ancient pipe; under *Symmoria* he seems not to know the textual question regarding the number of citizens who might unite to furnish a trireme. Under *Hercules*, we find no mention of him as a god of marriage; under *Cruquius* there is no allusion to the burning question of the genuineness of his MSS. of Horace. From the statement under *Æschylus* one would suppose that the editor thinks that the "Choephori" is found in only one MS. Under *Livius* we are willing to believe that Professor Peck means one hundred and twenty-one when he says that the first *twenty-one* books were not published until after the death of Augustus. There is no 'door-bell' actually mentioned in Suet. *Aug.* 91, nor is it certain that bells for summoning servants are meant in Sen. *de Ira*, 3, 35. The reference to the *Pseudolus* in the same article (*Tintinnabulum*) should be 1, 3, 98 (or better, verse 332), not 1, 3, 112. The whole article on bells might be greatly improved. No source is given for the picture that accompanies it. Under *Apollonius* of Tralles, it is said that he and his countryman Tauriscus were the sculptors of the Laocoön! Under *Album* (in the appendix), one of the numerous Pompeian election posters in favor of M. Cerrinius Vatia is called a notice "advertising a scribe."

In this review we have purposely touched upon the most diverse topics. It is evident that the editor should have divided up his great subject, intrusting each principal field to a sub-editor, and reserving for himself the general supervision and the writing of those articles only for which his studies had peculiarly fitted him.

A PRE-RAPHAELITE *AVANT LA LETTRE.*

Ford Madox Brown: A Record of His Life and Work. By Ford M. Hueffer. With numerous reproductions. Longmans, Green & Co. 1896. Pp. xx, 459.

When the definitive history of that artistic movement known as Pre-Raphaelitism comes to be written, a very large place in it will be given to a never very celebrated or very successful artist who died, almost in obscurity, on October 6, 1893. Whether or not Ford Madox Brown may properly be considered the true founder of Pre-Raphaelitism, his grandson, the writer of the present volume, is amply justified by the facts in calling him its precursor. An older man than any of the "brothers," the chosen master of Rossetti, and the adviser (if not strictly the master) of Hunt, his influence upon these young men must have been great. He never joined the Brotherhood himself, and several reasons have been given for it. There is even a contradiction of memory as to whether he was ever asked to do so. A comparison of the statements of Brown himself, of Holman Hunt, and of others would seem to show that if he was not formally asked, it was because he did not care to be, and that the obstacle was simply his greater age and experience, which rendered him somewhat less enthusiastic than his young friends, and gave him a distrust of brotherhoods and formal associations as leading to "cliquishness." In his art he was for many years more Pre-Raphaelite than almost any of the Brotherhood, and he remained a Pre-Raphaelite longer than any of them, except Holman Hunt, who has never changed.

Ford Madox Brown was born in Calais in the year 1821, the son of a retired purser of the British Navy, who resided abroad for reasons of economy. He early showed artistic tastes, and began the formal study of painting as a pupil of Gregorius of Bruges at the age of fourteen. In 1838 he became a pupil of Wappers at Antwerp, and it was the knowledge then acquired that gave him prestige, when he went to England, as a technician and as one who "was up in the Belgian School." On just how much technical achievement this reputation was based it is difficult for one to say who has not seen his earlier works. His methods were so revolutionized afterwards that his early training in painting went for nothing. His drawings, in the examples here given us, are almost incredibly feeble in handling. How he learned to paint may be well understood from his own words:

> "Those were the days," he says, "when my respected master, the late Baron Wappers, having been commissioned by his Government to paint the *Belgian Revolution*, had, for speed's sake, two of his pupils, whose duty it was to smear in with their hands, early in the morning, as much asphaltum as he could afterwards cover in with revolutionary heroes during the remainder of the long summer day. . . . These were the days when Wilkie's best works were coated with asphaltum, which has since made fissures all over them; when Hilton's *Sabrina* was so flooded with it that it now has to be hung alternately right side and wrong side upwards to prevent the figures from entirely running to the top or bottom of the picture."

In 1840 Brown went to Paris and spent four or five years there. He went into no school, but worked for and by himself. At this time Delaroche was the recognized head of the French school, and his style seems to have influenced the young Englishman in the choice of subject and general manner of treatment of such pictures as the "Mary Queen of Scots going to Execution," which was painted at this time. There seems to be no evidence that he was influenced by Delacroix and the colorists, or that he ever heard of the great land-

scape school that was then growing up in France from the influence of his countryman, Constable. It seems to have been entirely of his own motion, and without knowing anything of parallel attempts, that he then made his first efforts at realistic lighting, and tried, in his "Manfred," to paint figures in the open air as they would really look. He was not successful, and soon began to "study Rembrandt" and went back to his bitumen. In 1840 he paid his first short visit to England, and met the young lady who became his first wife and who died in 1845. In 1844 there was another short visit to England, and the exhibition at Westminster Hall of his cartoons of "Harold," "Adam and Eve," and the "Spirit of Justice," which seem to have impressed no one but Haydon, who, if a bad artist, was sometimes a good critic. It was the failing health of his wife which led to the voyage to Italy that was the turning-point in Madox Brown's career. Three important things happened during this voyage. First, he saw the Holbeins at Basle, and was deeply impressed by their unshrinking and absolute realism; second, he met in Rome the "Nazarenes," Cornelius and Overbeck, and his attention was drawn to their mediævalizing theories and their use of the term Pre Raphaelite; third, he saw the work of the early Italian painters. The results of these influences were shown almost immediately on his return to England, where, his wife having died in Paris on the way home, he settled in 1845.

The "Chaucer at the Court of Edward III.," begun in Rome, was not finished until 1851, but in 1846 he painted his "Portrait of Mr. Bamford" and in 1876 his "Wickliffe Reading his Translation of the Bible to John of Gaunt." His own account of the portrait may be quoted in full (as given in these pages), as showing better than could anything else the temper in which it was undertaken. The italics would seem to be the artist's own:

> "It is," he says, "the first evidence of an entirely new direction of thought and feeling on my part. . . . To those who value facile completeness and handling above painstaking research into nature, the change must appear inexplicable and provoking. Even to myself, at this distance of time, this *instinctive turning back to get around by another road* seems remarkable. But in reality it was only the inevitable result of the want of principle, or rather confliction of many jarring principles, under which the student had to begin in those days. Wishing to substitute simple imitation for *scenic* effectiveness, and purity of natural color for scholastic depth of tone, I found no better way of doing so than to paint what I called a *Holbein of the nineteenth century*. I might perhaps have done so more effectively, but *stepping backwards* is stumbling work at best."

It would be hard to express more explicitly the essential doctrines of Pre-Raphaelitism than is here done. "Simple imitation" and "purity of natural color" (*i. e.*, crudeness and brightness) were its great aims, and were first formulated by a man who was, to all intents and purposes, a foreigner, newly landed in London, and who knew not Ruskin. The other great mark of the movement, its mediævalizing tendency and the worship of the early Italian painters, is shown with equal clearness in the "Wycliffe." Here we have a composition arranged under a pointed arch, the principal figure bolt upright and squarely facing the spectator in the exact middle of the canvas, and supported by subordinate groups to right and left; a diffused light with no dark shadow anywhere, the figures being relieved against a distant landscape and pale clear sky; closely studied mediæval costume; and heads evidently copied directly from nature. If this is not a Pre-Raphaelite picture, it is certainly very near it, and it was the exhibition of this picture which called out the celebrated letter from Rossetti asking to become Madox's Brown's pupil. It is worth noting in passing that the letter was signed "Gabriel C. Rossetti," Rossetti not having as yet adopted the Dante which afterwards figured in his signature. It was in Madox Brown's studio that Rossetti was set at the accurate copying of still life, which he did not at all like, and it was to Madox Brown that he came, in 1848,

> "laughing, or at least more or less joking, about some discovery of Hunt's. It turned out that they were the reproductions of Orcagna's frescoes at Pisa. . . . I told him it was all nonsense to laugh at them—they were the finest things in the world, and he'd far better go and look at them again; and, of course, he said just what I did after he'd thought about it.
>
> "As to the name Pre-Raphaelite, when they began talking about the early Italian masters, I naturally told them of the German P. R.'s, and either it pleased them or not, I don't know, but they took it."

So was the Brotherhood founded, and the only reason given by Hunt for Brown's never having been formally invited to become a member, besides his age and the unpopularity of his works (!), is "that his works had none of the minute rendering of natural objects that the P. R.'s, as young men, had determined should distinguish their works."

If in the one particular of minuteness of detail Madox Brown was not yet a Pre-Raphaelite when the Brotherhood was founded, he soon became one to the fullest extent; and no more thoroughly Pre-Raphaelite paintings exist than "The Last of England" and "Work." Neither can any clearer insight into Pre-Raphaelite methods be gained than from the perusal of some passages of Madox Brown's diary. His phrase of "stepping backwards" describes Pre-Raphaelite practice perfectly. Pre-Raphaelitism, as practised by its founders and as advocated by Ruskin, was essentially an appeal to the boy or the savage; it was the denial of synthesis, of composition, and of art, and the attempt to produce a literal imitation of nature by exact analysis and by a return to the most primitive of technical methods. Their practice was more important than their theory, and this was to paint each object separately, direct from nature, on a pure white ground, proceeding thus until the last object was finished and the last bit of canvas covered, when the picture was complete. Justness of effect and beauty of tone are impossible by such a manner of working, but a certain glaring brightness of color and a hard glitter of detail are gained. The savage love of bright color and the savage desire for clearly recognizable facts are both satisfied. At the very time when the men of Barbizon were producing their splendidly synthetic and essentially artistic work, the most serious artists of England were struggling with the impossible task of reforming art by reforming it altogether.

On Thursday, the 19th of June, 1856, Madox Brown "came home and debated what I was to do. By Friday night I settled upon two fresh subjects." One of these was afterwards called "Stages of Cruelty," but is generally referred to, for obvious reasons, as "the Lilac Leaves." He had decided upon the picture on Friday night, and this is the account of the first day's work: "Saturday, 21st—After some bother and delays, began by three and worked till eight at the garden one; painted eight bricks and some leaves." Observe that, in this case, there cannot have been even an outline on the canvas. The "eight bricks" were painted all by themselves. A month later (July 19) he has "A great deal of trouble in arranging the leaves at the side of the head, pinning on fresh ones where they are blighted." It is only on the next day that he begins "designing the two lovers." The picture was finally laid aside and not finished till 1891. "The Last of England" was also painted in the open air, and, "when the flesh was being painted, on cold days," "to ensure the blue appearance that flesh assumes under such circumstances." The result on the painter's health was disastrous; that upon the pictures is best given in his grandson's own words:

> "When one stands before the picture ["Work"], it is difficult for the eye to find a point on which to settle. The color, too, is not 'colorist's color,' at least as I understand the words; it is wanting in harmoniousness, disturbing, and what not. One might almost say that both pictures ["Work" and "The Last of England"] had been painted with the then newly discovered aniline dyes."

Such was the true Pre-Raphaelitism of the early fifties, and of its exemplars Holman Hunt is the only survivor, as he was the only one who continued to work in that manner. Millais early deserted to the camp of the Academy. Rossetti, the greatest artist of the band, was never much of a Pre Raphaelite, and his immediate disciples, who constitute what is still called, by an abuse of speech, the Pre-Raphaelite school, are not Pre-Raphaelites at all. With the founding of the "Firm" (Morris, Marshall, Falkner & Co.), the movement changed front entirely, and became an æsthetic movement instead of a realistic one. Madox Brown was here also something of a "precursor," having been in the habit for some years of designing furniture for himself and his friends. He was oneof the founders of the "Firm," and furnished it with many cartoons for stained glass. As a result, after 1865, "his pictures became rather essentially decorative than essentially realist." As a member of the English æsthetic school he is best known, and in that capacity he has been a good deal overshadowed by the greater artistic and poetic feeling of Rossetti and the vastly greater ability of Burne Jones. It may be doubted whether, in the words of his biographer, "this stage of his art was nearly as much his own as was the realistic one." Yet in this later vein he produced such works as "Cordelia's Portion" and "Elijah and the Widow's Son," to name but two, which have great and serious qualities, if also grave defects. First of these qualities are to be ranked fine dramatic feeling and emotional expression. His color is also said to have attained great splendor and depth. His drawing was always tentative and uncertain, and in his effort for dramatic expression he was tolerant of strange awkwardnesses and ungainly attitudes. Another fault was an inexplicable fondness for great bundles of crinkled drapery that destroy all simplicity of mass and dignity of line. His last years were devoted to a series of decorative paintings for the Manchester town hall, which show in their composition all the merits and all the faults of his later manner. Of their effectiveness as decoration one who has not seen them in place has no right to judge.

We may conclude with another citation from Mr. Hueffer's admirably impartial summing up:

> "His work was never suave, never *quite*

complete; but it was vigorous and honest to the end, always instinct with a noble feeling for style, and, within its wide but well-defined limit, as thorough as possible."

JEWISH LIFE IN THE MIDDLE AGES.

Jewish Life in the Middle Ages. By Israel Abrahams, M.A. Macmillan Co. 1896.

THE research involved in this piece of work must have been patient and profound; nevertheless the author presents his results in an attractive manner. Acknowledging his indebtedness to distinguished scholars, he is confident that there are not five in a hundred of his citations (of which there are many hundreds) which he has not verified by reference to the original sources. To the brilliant work of M. Anatole Leroy-Beaulieu, 'Israel among the Nations,' Mr. Abrahams's study brings on special lines much valuable confirmation, but it is very differently conceived from that highly rhetorical yet powerful argument. Mr. Abrahams is in no sense an apologist. He extenuates as little as he sets down in malice. But it is much more difficult to recover from the past a true conception of men's actual life than to recover a true conception of their ideals. Both are reflected in contemporaneous literature, but the latter with much more exactness, for it is proverbial wisdom that we cannot accept the indictments of a Jeremiah or a Juvenal as literal transcripts of the social truth; and with as little confidence can we accept the defensive pleas of sectaries when contrasting the virtues of their own sects with the vices and the crimes of other bodies of believers. It so happens, therefore, that Mr. Abrahams has given us a much less satisfactory account of Jewish life in the Middle Ages than of Jewish aspiration; but he has not made the mistake of confounding the one thing with the other, and by careful check and counter-check has done much to bring us face to face with the realities of an experience that abounds in interesting and significant details.

In one respect he confesses to a personal disappointment: he undertook his task with the impression that Jewish life in the Middle Ages was everywhere more or less similar, and that it would be possible to present a generic image of it. "Deeper research has completely dispelled this belief." We have, consequently, less a survey of Jewish life than of Jewish lives. That Jewish life has worn the same family face since the fifteenth century was the misleading circumstance. But in the correction of Mr. Abrahams's misconception resides the principal value of his book, both for himself and for those who read it. Herein we have abundant confirmation of the idea of M. Leroy-Beaulieu, that the modern Jew is the creation of the Ghetto in the main. But his rhetorical effusion blinded us to the narrow limits within which the Ghetto has done its characteristic work—from the fifteenth to the eighteenth century inclusive. Up to the beginning of this period Judaism had much more freedom and variety than it has had since, much as the last century has done for its expansion, and its history was mainly one of progressive assimilation with its environment, freely exchanging benefits and things socially injurious. Much that has been thought peculiar to the mediæval Jew is shown to have been the common property of the Jews and Christians. It must be confessed that the *ensemble* of mediæval Jewish life is a very pleasing one; joyous and playful to a degree that shames the manners of the present time.

The synagogue was the centre of social life. Any Jew who conceived that he had a grievance against another had a right to interrupt the synagogue service until he had obtained a public promise of redress. Lists of debts discharged were read in the synagogue, and lists of stolen goods. Jews about leaving town gave notice there of their intention, and invited the presentation of pecuniary claims. The gayeties of the synagogue over a wedding were of immense variety, and then, too, the sorrows of individuals were made those of the community. The habits of the synagogue had some curious and many interesting features. It took three centuries of the Ghetto to make the Jews indifferent to dress and cleanliness. It may seem a little matter that a certain rabbi had a bag on the wall near his seat in which he kept a pocket-handkerchief; but this convenient article of dress was generally unknown. Laymen were admitted to participation in the synagogue services, but the right went to the highest bidder. The anti-Semite will find his expectations justified by the public announcement of gifts for charitable or religious purposes, but this custom had the amplest Christian precedent. Boys were considered adults at the end of their 13th year, but long before were admitted to a share in the services; and of boy-orators there were many then as now.

We have a valuable chapter on the communal organization. The burden of taxation fell heavily upon the Jews, and the privileges of the wealthier increased with their responsibilities. It was Christian greed that converted the aristocracy of learning into an aristocracy of wealth, and this not until the close of the seventeenth century. The communal regulations were minute, and every infringement of them had its specific penalty, which the civil arm was sometimes invited to enforce, and sometimes demanded as its right. The Ghetto had its beginnings in the communal organization. As early as the thirteenth century there were voluntary aggregations in certain parts of the great towns and cities; but these were not rigid in their inclusions, and what was dangerous as a voluntary distinction became monstrous as a compulsory imprisonment. Sometimes a protection from the mob, the Ghetto was oftener a defenceless pen. The houses in the ghettos were often owned by Christians who charged exorbitant rents. "There is a curious subcurrent of evidence that the Jews were less exacting in their usurious demands than were others who carried on similar trades." We find them constantly employed in offices of financial trust because of their reputed honesty. Their gravitation to money-lending as their most characteristic occupation was not a voluntary one. They took kindly to handicrafts and agriculture, much preferring skilled labor, not as lighter but as more intellectual; but the restrictive policy of the Church cut them off from one occupation and trade after another, and made money-lending a necessity of their situation, if they had any to lend. Thomas Wilson's famous 'Discourse upon Usury' (1572) is quoted as charging Englishmen with being worse than Jews in their exactions. The former were content with five and ten per cent., "whereas englishe usurers exceed all goddes mercye, & will take they care not howe muche."

The chapters upon courtship, marriage, and divorce are among the most valuable and entertaining. Child-marriage was the rule by the thirteenth century, most girls being married before the conclusion of their legal minority, which ended with their twelfth year. The motives were in part pruriently ethical and in part mystical: any Jewish girl might be the mother of the expected Messiah. After making the engagement of marriage, the parties saw little or nothing of each other until the time for its consummation, the lover sometimes binding himself by written agreement to abstain wholly from the girl's society. The *Shadchan* was a professional match-maker with a legal status, and did a thriving business. Child-marriage did much to increase the frequency of divorce, while the prior engagement frequently broke down. The travelling habit was a potent cause of marital instability. The absentee husband dared not count upon his wife's fidelity or his own, and often on his departure gave the wife a conditional divorce, to take effect if he did not reappear at a stipulated time. There were also "imperfect divorces," designed to protect the wife from rapacious imposition during her husband's absence. The compulsory marriage of rabbis made marriage an ideal state, and furnished it with many beautiful examples. It was the *Chazan*, the synagogue precentor, who was expected to be frail, and too often justified the expectation.

"Monogamy was the result, and not the cause, of an idealized conception of family relations." Jewish life had already at the beginning of the Christian era outgrown polygamy, while there was no formal prohibition of it in the Old Testament, as there is not in the New. The idea that Jewish life followed the Christian example in this particular is without any real warrant. What is true is, that the Jews in Spain followed a polygamous Mohammedan example to some extent, and, always sensitive to their environment, reverted quickly to monogamy in monogamous societies, Jewish or Christian. Jews and Christians were much on the same level during the first eight or nine centuries of the Christian era. "The language of several popes was by no means sternly monogamous." Polygamy, or at least bigamy, was permitted on what seemed to be sufficient grounds. The religious duty of begetting children made such concessions easier for the Jew, but after the tenth century they had no legal force. The same ends were reached by making the business of divorce more expeditious and widening the range of its permission. In the account of marriage customs the student of survivals will find many things he will appreciate, and the student of manners many charming amenities in the relations of young and old, parents and children, man and wife. There is much here to rebuke the conceit of universal progress, and to shame the indignities and disabilities which have reduced the Jew so far below his best estate.

There is a painful chapter on "the Jewish badge." This badge was but the worst of many distinctive forms of dress enforced upon the Jew. It made of him a pariah, the mark of every insult that malignant hatred could devise. It was the invention of Innocent III. (1215), and gives to the irony of his official name its keenest edge. In pleasing contrast with the treatment to which the Jews were themselves subjected was their treatment of dumb animals. This had its sentimental side, as in the Old Testament, where a kid may not be seethed in its mother's milk. To wish that a man might outlast his shoes was not permitted, because a new pair involved the destruction of animal life. Out of a count-

less multitude of details in Mr. Abrahams's book one knows not which to choose. But the general drift is unmistakable: it is to the persuasion that the modern Jew is to a very great extent the creation of Christian narrowness and cruelty, and to the hope and trust that, in proportion as these are outgrown, the Jew will assume his true place in the economy of nations—a place of which he will not be ashamed.

Letters to Young Shooters (Third Series). Comprising a Short Natural History of British Wildfowl, and Complete Directions in [*sic*] Shooting Wildfowl on the Coast and Inland. By Sir Ralph Payne Gallwey, Bart. With 200 illustrations by Mr. C. Whymper, Mr. J. G. Millais, Mr. De Bree, and the author. New York: Longmans, Green & Co. 1896. Crown 8vo, pp. xxx, 630.

THE distinction drawn by English sportsmen between "game-birds" and "wildfowl" is one which Americans do not make between those gallinaceous species ordinarily shot for pleasure or profit and those aquatic species pursued for the same reasons. Thus, the well-known and authoritative writer of the present third series of 'Letters' (*i. e.*, chapters in each of three books) dealt in the first place with the choice and use of the gun; in the second, with the preservation and destruction of "game," as pheasants, partridges, and their allies; he now comes to treat of "wildfowl" and of fowling, in which, as in the other branches of sport, he proves himself to be a past master of his craft—the ungentle art of destroying birds with neatness, dispatch, and certainty. We are struck by his extraordinary patience and precision in the minutiæ of the subject he handles at such great length and in such extreme detail, after personal experiences probably unsurpassed in every respect. He also writes with a full heart, and out of its abundance comes everything he can possibly give us to put us in the way of sharing his own pleasurable success in fowling. For example, in the latter part of the book, where he tells us how to make the ideally best punt, the directions are so minute, so precise, and so clear, text and figures alike, that we have no doubt of what he puts in small capitals at the end of this lesson in boat-building: "Any amateur or professional boat-builder who is unable to construct a first-class gunning-punt by following these simple directions, is deficient in brains or in ordinary manual dexterity" (p. 527). It is the same with the management of the big death-dealer—the stanchion-gun, weighing from 80 to 170 pounds, throwing from ¾ to 1¾ pounds of shot, with a charge of powder up to 5½ ounces. We have this formidable armament at full length—not only with "lock, stock, and barrel," as usual, but with all the other fixtures requisite either for its deadly work on wildfowl or against something of the same sort for the fowler. That there is danger from the butt as well as the muzzle of such a weapon appears from the impressiveness with which the author insists that the breeching-rope shall be secure, and recommends an additional safeguard in terms of a grim humor. Thus, supposing the breeching to part, and no safety-rope to have been provided: "When . . . you have rearranged, as best you can, your battered features, mopped the blood from your face, and, if your eyes are not closed up, picked off the floor of the punt those of your teeth that were not knocked down your throat or overboard, you will perhaps be ready to admit, when too late, that a safety-fastening to your stanchion-gun would have been an advantage" (p. 549). We note further in this connection that the author expresses his decided preference for the good old-fashioned muzzle-loader, though of course the shoulder-gun he carries is a modern breech-loader.

Everything about the management of the punt and the big gun, single-handed or with a puntsman, all the methods of stalking wildfowl, by day or night, in all weathers, seasons, and sorts of places, are set forth in this book with the utmost particularity—not without some repetition, some insistence upon details that seem too obvious or too trivial to be dwelt upon at such length, but all tending to the fowler's success in his varied, his arduous, his often perilous pursuit. The spirit of the whole is contagious; we catch it, and in imagination follow Sir Ralph with something of his own enthusiasm, albeit tastes differ, and we confess that we would rather go with him in this book than be in the same boat with him! Here we are in no danger of being swept out to sea, and take none of the risks which would have cost him his life "a dozen times over" but for the very precautions he urges upon all in this volume, where the worst we have to face is our genial sportsman's sad abuse of small capitals and italics. The text is simply riddled—"killed twice over," as he says of some of his ducks that get more than their share of shot—with pellets like this:

"One of the *first* matters to consider under the title of this letter is *safety*. It robs stanchion-gunning of *all* its charm if you are continually wondering *how* you will contrive to reach home *if* the water becomes rough *or* an adverse wind should blow" (p. 580).

Or this again, for a random shot at passages the like of which for single and double underscoring occur on almost every page:

"INSTANT DECISION is essential *when* the *fowler is* in killing range, for, without a *moment's hesitation*, he will have to *make up his mind how and where* to place the shot-charge among the birds so as to bag the *largest possible* number" (p. 599).

It is clear from these cases that the pen in some hands may have terrors as well as the gun; but we are prepared to brave them all, after our dismay, and have no further criticism to pass upon the otherwise altogether admirable book. Its main body, upon which we have not yet touched, is devoted to the systematic natural history of British wildfowl, from the fowler's standpoint. The brent and certain other geese, the widgeon and a certain few other ducks, are the main objects of his pursuit; but all the *Anatidæ*, all the *Limicolæ*, and other water birds are passed in orderly review, with sufficient technical description for their identification, and excellent accounts of their respective habits. The most practised closet-ornithologist may profitably turn to these pages for information in some cases. The author knows what he writes about, and handles the subject with great precision. He has made one of the best "practical" treatises on ornithology we have read for a long time, and we know where else to to look for Latin names or taxonomic niceties which would be out of place here.

The illustrations are all we should expect from the names of the artists who have contributed to the beauty and interest of the author's work. The fine portraits of the birds themselves are to the life, and the full-page plates of sporting scenes illuminate the text. The finest one of them, to our eye, represents the fowler on the ooze, alongside his punt, amidst his battue of dead ducks, with his hat in his hand to "another sportsman on the scene"—a peregrine falcon soaring overhead—and saying, "Take one and welcome, you splendid fellow!" Another telling composition is the "Blown out to Sea," when the fowler and his punter are just about to throw the big gun overboard to keep from being swamped or capsized in the surf. But were we to particularize concerning the animated scenes and portraits, we should hardly stop short of the whole series, and should have to include even the humbler woodcuts which show everything about the punt and the gun, drawn to scale with an accuracy that accounts for every fraction of the inch. Such excellence of text and illustrations as we attest throws the literary infelicities we have criticised back to the vanishing-point, like a gaggle of geese in the gray of the morning after a miss-fire. The author misses no shots in the book, but brings his game to bag in his own gallant way; and success in writing of fowling, as in fowling itself, is the best criterion of means to that end.

Elements of Psychology. By G. Croom Robertson. Edited by C. A. Foley Rhys-Davids. Charles Scribner's Sons. 1896.

An Outline of Psychology. By Edward Bradford Titchener. Macmillan. 1896.

IT is not altogether easy to determine whether the abundance of psychologies issued in recent years is due more to the rapid progress of that science, to the expectations which the public has been induced to entertain about it, or to the differences of opinion prevailing among its professors and stimulating each to have his say upon the subject. At any rate, we have here two more text-books of psychology which are neither of them devoid of pedagogic value. The volume bearing the name of the late Prof. Robertson is indeed nothing but a compilation from notes of his lectures preserved by his pupils at the University College, London, edited with discipular piety by one of them, Mrs. Rhys-Davids, and betrays its origin in its form and every phrase. It is abrupt in literary statement, cautiously empirical in standpoint, and, as its plentiful references to Spencer, Bain, Sully, and Höffding show, hardly intended for independent use as a text-book. A fastidious critic might on principle object to it that lecture notes do not become a book by the fact of publication, and that it is a doubtful service to the departed to fling upon the world posthumously what they did not choose to publish in their lifetime.

Prof. Titchener's book stands on an entirely different footing. It is the work of a young man still actively engaged in teaching, and forms a methodical and carefully arranged statement of his present views. These are well brought out by a manner of writing which, in spite of a certain fondness for technical terms, is preëminently clear and direct. We note several points of interest about his treatment of mental phenomena. (1.) His psychology is essentially experimental, and he tells us that he has not described any experiment which he has not himself performed. (2.) It confines itself to the consideration of the adult normal human mind, and excludes on principle all reference to genetic methods, to infant, animal, abnormal, and social psychology. The very sufficient reason Prof. Titchener gives for this procedure is that these studies have not yet reached the level of science, and his adhesion to the course laid down is not substantially impaired by his selecting an occasional

illustration from the tabooed branches of psychological inquiry. (3.) He brings psychology into the closest possible relation to physiology. To be experimental, he says, psychology must employ the method of introspection under experimental conditions—that is, adapt the methods and machinery of the natural sciences. As a matter of fact, the science whose language he adopts, and to whose authority he appeals, is almost exclusively physiology. Sometimes, indeed, he seems to jump at the physiological where explanation in purely psychological terms seems quite attainable, and to carry his deference to physiology further than is necessary or warranted, as, *e. g.*, when (p, 342) he states it to be simply a *fact* that there is "no psychosis without neurosis." That is doubtless a highly probable and convenient theory to work with, but, as a sheer statement of established fact, we prefer Prof. Robertson's diagram (p. 43), and his view of the *inferential* character of the particular physical processes that are asserted to correspond to many familiar mental processes.

(4.) As might have been expected from a translator and pupil of Wundt's, Prof. Titchener is strong on the "elementary" processes of consciousness. But, like Münsterberg and Külpe, he has reduced the master's *three* to two by the rejection of any special volitional process shown in effort, attention, voluntary movement, choice, self-consciousness, etc. This is interesting as showing how inevitably Wundt's naturalistic method tends to destroy the conceptions linking psychology to the higher philosophic sciences, in spite of his own struggle to retain them. Prof. Titchener allows us to be under no illusion on this point. He has no use for will in psychology, and interprets all such processes in terms of physiology. Thus, the explanation, *e. g.*, of the differences of mental constitution, of the retention of past experiences in memory, of the owning of mental processes by the individual "self," etc., is in each case frankly found in the existence of the bodily organism.

It is true (5) that the book concludes with a short chapter on the philosophy of mind, touching upon the further questions which, according to Prof. Titchener, lie beyond the science of psychology, relegates them to metaphysics, and quotes with apparent approval some of Lotze's remarks on the unity of mind. But after so thoroughgoing an admission of physiological explanations, after so unhesitating an acceptance of the metaphorical descriptions of bodily motions found in physiology as "nerve-currents," "cell explosions," "transfers of energy," and what not, it is not easy to see what there is left in psychology to demand further treatment in metaphysics. Nor is a metaphysical reinterpretation facilitated by the very definite way in which Prof. Titchener has set psychology on the side of the lower sciences over against the higher, such as logic and ethics. It is to be hoped that he will see his way to be more explicit in a subsequent edition, and show us, *e. g.*, how he would conceive of metaphysics as reëstablishing the unity of the mind which has been so ignominiously expelled from psychology.

After thus drawing attention to the main characteristics of Prof. Titchener's standpoint, we may conclude by congratulating him on producing, within the limits indicated, an interesting presentment of his subject, the use of which as a text-book is rendered easy by an excellent index.

The Bay Colony: A Civil, Religious and Social History of the Massachusetts Colony 1624–1650. By William Dummer Northend, LL.D. Boston: Estes & Lauriat. 1896.

Samuell Gorton: A Forgotten Founder of Our Liberties, First Settler of Warwick, R. I. By Lewis G. Janes. Providence: Preston & Rounds. 1896.

THE frontispiece portrait of John Winthrop in Mr. Northend's volume, and the termination of the narrative with Winthrop's death, harmonize with the liberal reliance upon this worthy's Journal by the present historian. Nearly forty per cent. of Mr. Northend's references are to this source, and his point of view may be said to be substantially that of Winthrop. Textual citations from this authority are correspondingly numerous. While welcome in themselves, they often stand in need of such a gloss as the Rhode Islanders, for example, have been supplying for the past two centuries, and Mr. Janes the latest, in the work bracketed with Mr. Northend's above. Orderly and interesting as is this succinct chronicle of the Bay Colony, it falls short of suggesting to the unlearned reader the vast contention which has raged over the subjects of some of the chapters, as, Roger Williams, Anne Hutchinson, and Samuel Gorton. One coming fresh from Bodge's 'History of King Philip's War,' also, might feel a certain softening in the picture of the treatment of the Indians. Nevertheless, while Mr. Northend manifestly reverences the Puritan founders and their foundation, he is not a professional apologist. In this respect he compares favorably with Palfrey, the first volume of whose Abridgment parallels his own undertaking, and cannot be said to be more readable, more perspicuous, or more just.

We must refrain from episodical comment on this presentation of the ever-memorable struggle of theocratic government, on the one hand against interference by the Crown, on the other against the disrupting tendencies of immigration and the natural enlargement of the human spirit. The seeds of revolution and separation are clearly discernible in the one phase of the colony's experience during the quarter-century under review; the futility of the cut-and-dried in civil, religious, and social arrangements equally shines forth in the other. We prefer to direct attention to Mr. Northend's chapter xiv. on the dispute between the Assistants and the Deputies for its bearing on the present *reductio ad absurdum* of representative government in this country since the power of nomination has been taken away from the people. As early as 1640 in the Bay Colony an endeavor was made to secure such nomination of the magistrates (*i. e.*, Governor, Deputy-Governor, and Assistants) in town meeting. The deputies to the General Court elected at these meetings were thereupon to "call for nominations for magistrates, record the names of those nominated and the number of votes for each, and make return of the same to the next General Court." This body was to count the votes and report the highest back to the electors, who might on election day vote pro or con, but for no other nominees. In 1642 a nominating convention, meeting at Salem and composed of delegates from the several towns, was proposed, the names thus certified to the Secretary of the Colony being alone eligible. In 1643 reversion was made to the plan of 1640, "with some explanation." In 1644 the machinery was: nomination in town meeting, sealing of the votes and confiding them to a committee to meet similar committees at the shire-town of the county, counting of them, and report of the highest, who alone could be voted for or against. This system was doomed to disappear with the growth of population, and no proposal to restore to the people its ancient and salutary right has ever obtained a foothold among us, who are now but the veriest slaves of the Machine.

Mr. Janes does not add much to our knowledge of Gorton (who is anything but "forgotten"), but he makes plain the peculiar views of this uncomfortable neighbor to the Bay, touching the power of colonists to organize themselves without a charter and to abrogate the body of English liberties. Gorton

"held that, as subjects of Great Britain, the colonial governments should conform in their legislation and judicial action to the principle of English common and statute law. If chartered, they were bound to do this by the terms of their charters. If not chartered, each individual had the right to claim the protection of English law, and any denial thereof was a usurpation of authority. This was the head and front of his alleged anarchism."

His disorganizing religious views also are exhibited by the aid of an unpublished voluminous commentary on the Lord's Prayer. They resembled those of the Quakers in respect to prophecy, inspiration, and outward ordinances, without, however, accepting the "inner light" or the non-resistant attitude towards government. His idea of Jesus would be called Unitarian. "With Theodore Parker, he taught that the divine nature is both masculine and feminine; and, in one of the most striking and eloquent passages in his Commentary on the Lord's Prayer, he argues for the equal recognition of woman in the Church and as a teacher of religion."

Gorton, like Roger Williams, Anne Hutchinson, Mary Dyer, Randall Holden, and Obadiah Holmes, has left a large and vigorous posterity, and will, we may be sure, never lack a vindicator.

Modern French Literature. By Benjamin W. Wells, Ph.D. (Harv.). Boston: Roberts Brothers. 1896.

THE first three chapters of this work, introductory to the historical scheme of the sequel, contribute so little to the purpose of the volume that they might well have been condensed into an opening sketch, instead of taking up one hundred and eighteen pages. The remaining chapters are devoted to the literature of this century from Mme. de Staël to our own day, passing in review the productions of France in poetry, the drama, criticism, and prose fiction, with detailed treatment of the Romantic and Naturalistic movements. Neither the author's ample prefatory acknowledgment of indebtedness, nor his declaration that he has himself verified the validity of opinions freely adopted, can quite make up for want of originality in leading conclusions, so that the work may be described, not unfairly, as a clear summary of French judgments on French literature set forth to English readers. Chapter ix., for example ("The Evolution of Lyric Poetry"), already published as a separate essay, discloses the authority of Brunetière; while others pay recognizable tribute to such well-known leaders as Faguet or Lanson, even without the voucher of footnotes. Perhaps because of this deference to French authority, Dr. Wells seems to lack warmth in commending, and shows to better advantage in estimating critical, rather than creative, work. To judge of this, the reader has but to contrast the excel-

lent chapter (viii.) on the "Evolution of History and Criticism" with the mere list of epithets and rhetorical interrogations on the subject of Hugo's 'Les Châtiments.' And probably also out of deference to French opinion the works of Verlaine, the Décadents, and the Symbolistes are discussed as serious contributions to the poetry of the nineteenth century. We may note that this modesty has had the minor effect of fairly spangling many pages with uninviting quotation marks.

In spite of wide and generally careful reading, Dr. Wells's principles of discrimination are not invariably clear. If Gustave Planche, Jules Janin, and Paul de Saint-Victor are to be omitted from the list of critics as "not standing for something," why need notice be taken of the "ephemerally popular" contemporary, Jules Lemaître? Any account of French Romanticism may well be expected to mention the name of Mürger, but it is wanting, as, among contemporary poets and novelists, we miss Catulle Mendès, who is at least as earnest in his artistic aims as Joris Karl Huysmans, and who writes undeniably better French. Some of these omissions may no doubt be explicable on the ground of a too great attachment to the literature of the moment. Dr. Wells has rendered service to reader or student in his examinations of Hugo, Flaubert, and Zola; his treatment of Hugo is especially exhaustive and accurate in its conclusions as to the total worth of this author's work.

More careful revision would remove several errors of detail, of which we note the following: Frédéric et *Bernadette*, Ragabas, Forte comme la Mort, La Duchesse de Langleais, Méta Holdennis. The opportunity of a new edition might also be seized by Dr. Wells for checking his taste for irrelevant and confused comparisons, the appended specimens of which have not been unfairly picked: "Madame de Staël used to sit at her mother's feet, and drink in the strong drink of the debates and discussions around her, storing up silently, like a busy bee, material," etc. (p. 120). "While his [Lamartine's] verses flow as naturally as the gentle rain from heaven, their ethereal mushiness drowns the germs of healthy realistic action" (p. 161). "The Mephistophelian spirit that enamels our overstrained consciences with its sceptical Pyrrhonism, mocks at duty and virtue, and answers every noble aspiration with a sneer" (p. 366). "Little more than the echo, sometimes the distorted echo, of such nebulous thinkers," etc. (p. 402). Such lapses as those just noticed provoke and justify Paul Louis Courier's petulant exclamation, "Dieu, délivre-nous du malin et du langage figuré!"

The Story of Canada. [The Story of the Nations.] By J. G. Bourinot, C.M.G., LL.D., D.C.L. G. P. Putnam's Sons. 1896.

THE editor of the "Story of the Nations" series had a stroke of good fortune when he enlisted Dr. Bourinot, whose volume on Canada takes rank above most of its fellows in the set. Written by one who has enjoyed every facility for informing himself, it represents the reading of many years compressed into popular form. The author claims "always to have consulted original authorities," and his statement is borne out upon every page. He begins with Leif Ericson, and alludes to the general elections of last June, so that he pretty well covers the ground. His first interests are constitutional, and he has made the department of parliamentary procedure his own. Nevertheless, he resists the temptation of filling his chapters with politics, and writes in the easy, agreeable strain expected of him on the present occasion. We advise summer tourists when starting for Quebec or the Maritime Provinces to add this historical sketch to 'Their Wedding Journey,' 'Baddeck and That Sort of Thing,' and 'The Seats of the Mighty.' The illustrations are particularly good. We have rarely seen a more suitable selection in a book of the kind. Many of the cuts are taken from inaccessible works, and the choice has been judiciously made with a view to explaining the text.

The unwary reader might suppose from Dr. Bourinot's surname that he was of French Canadian extraction and that he would be tempted to portray events from the French standpoint. This is not the case. He is a Jerseyman by origin, and has always been a Britisher of strong imperial leanings. The most picturesque part of Canadian annals lies before the cession, and Dr. Bourinot only follows universal precedent when he gives the bulk of his space to the period between Cartier and Montcalm. As might be expected from the fact that the author was born in Cape Breton, the Acadian and Louisburg chapters are done with special care. The volume concludes with an entertaining excursus on the French Canada of to-day and the manners of its inhabitants.

We fear that Dr. Bourinot has somewhat idealized Jacques Bonhomme, both in his private and public relations. "The temperate habits of the French Canadian make them [*sic*] necessarily valuable employees in mills and manufactories of all kinds. Indeed, they prefer this life to that of the farm, and until very recently there was a steady exodus of this class to the manufacturing towns of Lowell, Holyoke, and other places in New England." We imagine, on the contrary, that the French Canadian's willingness to work for a small wage has appealed to the mill-owners of this country quite as much as his indifference to *whiskey blanc*. Again, apropos of the typical village which one finds in the basin of the Lower St. Lawrence: "Whitewash is freely used inside and outside, and there is on the whole an air of cleanliness and comfort in the humblest cottage." We can vouch for the whitewash, but the cleanliness is a beautiful illusion of the sympathetic historian. How can twelve people snowed up for five months in a house of four rooms keep clean? As for the summer, if Dr. Bourinot is fond of fishing, let him explore the country through which the Labelle branch of the Canadian Pacific Railway runs. A few nights in the best hotels of that region will tend to modify the view he now holds of French Canadian cleanliness and comfort.

We leave outside this notice such weighty constitutional questions as the Quebec Act and the founding of the Dominion, for the sake of according brief praise to Dr. Bourinot's account of the three domestic disturbances which have arisen in Canada since 1815—the "Papineau War" and the two risings instigated by Louis Riel. A statement of Lord Durham in 1839 shows the significance of the first of these: "I found two nations warring in the bosom of a single state; I found, not a struggle of principles, but of races." Dr. Bourinot describes the conflict with spirit, castigating Sir Francis Head as he deserves. The Riel rebellions are treated with eminent fairness. Since the last one was repressed, the life and property of settlers in the northwest territories have been as secure as they would be in Ontario or Quebec. The Mounted Police deserve to stand beside the Spanish Civil Guard.

We can heartily commend this book to all who are on the watch for a concise and readable outline of Canadian history.

A Record of the Buddhist Religion as Practised in India and the Malay Archipelago (A. D. 671-695). By I-Tsing. Translated by J. Takakusu. Oxford: Clarendon Press; New York: Macmillan. 1896.

CONTEMPORARY accounts by foreigners are of interest and value in contributing to our knowledge of a country or of a people, whether the time be ancient or be modern. Special importance may be attached to such accounts when the writer is a trustworthy observer and his subject one upon which we need information. This is true of the record which a Chinese traveller of the seventh century, one I-Tsing, himself a Buddhist, has preserved of his visit and long stay in India more than twelve hundred years ago. I-Tsing is the third of the famous Chinese pilgrims that journeyed to the holy land of the Buddhists. Fā-hien had been the pioneer in these sacred pilgrimages two centuries before him; and I-Tsing's contemporary, the Celestial Hiuen Thsang, had returned from the shrine of the Enlightened and died but a few years before I-Tsing started for India's shores. Born A. D. 635, an ardent student of the Sacred Canon of the Buddha, a member of the Holy Buddhist Order, I-Tsing was thirty-seven years old when he found himself at last able to carry out his cherished plan of visiting Hindustan. For more than a quarter of a century he remained abroad, most of which time he spent in India. This faithful pilgrim brought back to China a large number of Buddhist texts and spent several years in translating these religious volumes into his native tongue.

The present Record of Buddhist Practices, or 'Nan-hai chi-kuei-nai-fa-ch'uan' (a record of the inner law sent home from the southern sea), he composed while in Sumatra (A. D. 690–692). In it he dwells chiefly on the monastic life and discipline of his time, as his object was to correct certain erroneous practices, or misrepresentations of Buddhistic rules, that had crept into China. The chapters are necessarily of great interest to students of the Vinaya texts; but, more than that, they contain much that the general reader, or the curious, will peruse with no small pleasure. The Sanskrit scholar will find abundant material for careful study in pages 152–185, where I-Tsing enters upon literary and linguistic matters with reference to Sanskrit. The material thus furnished by the Chinese pilgrim was known, indeed, before; but it was not, until now, so accessible as the present translation makes it. Incidental allusions by I Tsing render important service in fixing dates in the desert region of Hindu literary chronology. Passing mention, for example (p. 178–180), of Bhartrihari, and the sentence "It is now forty years since his death," enable us to say with comparative certainty that this Sanskrit writer of proverbial philosophy passed away about A. D. 651.

The importance of the work may be judged from the long letter with which Max Müller introduces the book. The translation of I-Tsing had been begun some years ago by Kasawara, one of Max Müller's Japanese Buddhist pupils. After this young man's untimely death, the present translator took up the task anew, and it seems he has completed it in a thorough

manner, availing himself of the various contributions to the subject by French, English, and Japanese scholars. He has prefaced the volume with an elaborate and useful general introduction. A map is added, tracing I Tsing's travels. The book is timely and is welcome.

BOOKS OF THE WEEK.

Austin, L. F. At Random: Essays and Stories. Ward, Lock & Co. $1 25.
Baldwin, James. A Guide to Systematic Readings in the Encyclopædia Britannica. New and revised ed. Chicago The Werner Co.

HENRY HOLT & CO., *29 W. 23d St., New York,*

HAVE JUST PUBLISHED

A DIPLOMAT IN LONDON.

Letters and Notes (1871–1877). Translated from the French of CHARLES GAVARD. 12mo, $1.25.

M. Gavard left Paris in 1871, just before the entry of the Prussians. He was in the French Legation to the Court of St. James for seven years. He took part in many "functions" and visited many great houses, and his account of the every day life of the English aristocracy is most intimate, and brightened by humor and satire. He also meets, among others, the Rothschilds, Gounod, the Empress of Germany, and the Czar. He writes much on Bismarck.

TELEPATHY AND THE SUBLIMINAL SELF.

An Account of Recent Investigations Regarding Hypnotism, Automatism, Dreams, Phantasms, and Related Phenomena. By Dr. R. OSGOOD MASON. With a copy of a portrait made while in a trance by a person who had never painted before. 12mo, $1.50.

A book accurate enough for scientists and simple enough for lovers of "ghost stories." On a thread of theory and discussion, Dr. Mason links many startling examples from his own professional experience and from the Proceedings of the Society for Psychical Research.

Published by LEVYTYPE COMPANY, Philadelphia.

CUBA AND THE CUBANS.

BY

RAIMUNDO CABRERA,

Member of the Executive Committee of the Cuban Autonomist Party, Ex-Provincial Deyuty, etc.
Author of "Los Estados Unidos," etc.

A useful and timely book.—*The Nation.*
The volume is well edited.—*N. Y. World.*

The Nation.

NEW YORK, THURSDAY, FEBRUARY 18, 1897.

The Week.

SENATOR MORGAN withdrew his Nicaragua Canal bill on Wednesday of last week in a spirit of frenzy the like of which has seldom been witnessed outside of Bedlam. He stormed against Great Britain, against Nicaragua, and against Senator Sherman by turns, and declared that although the bill was defeated for the present, he should introduce it again at the beginning of the extra session and do all in his power to pass it. While flouting the incoming Administration in the person of its Secretary of State, he invoked the aid of the President-elect to help him along with his plan to force a canal upon Nicaragua without her consent. This is the first time in the history of the world, we believe, in which the proposal has been seriously made by one country to build a canal in another country without a charter and against the written protest of the latter country. It is the first time, also, that it has been proposed to extort permission for the expenditure of money in a foreign country by abusive and threatening language. Of course this is not the last of the Nicaragua Canal, but it must be the last of this bill unless the whole Senate and Government of the United States have gone crazy.

The debate in the Senate on this bill has been exceedingly wholesome. The speeches of Senators Turpie, Vilas, Daniel, and Caffery were extremely able and thorough. It is to be regretted that all the labor of defeating the bill was thrown upon Democrats, and all the consequent credit reaped by them. The reason why no Republican Senator took part in this work is not easy to understand. Although Senator Sherman did favor the abandonment of the bill because it could not pass, he said that he should vote for it "in any shape in which it was likely to be presented." Senator Hale expressed himself decidedly against it, and rebuked Morgan for his unmannerly and intemperate language towards Nicaragua and towards Great Britain, but he made no set speech against the bill. The division in the Senate seemed to be principally between those who wanted to consider the Clayton-Bulwer treaty obsolete and those who did not—between those who desired a canal for purposes of peaceful commerce, and those who desired it for purposes of irritation and discord, or were willing at all events to go with those who wanted to stir up discord by means of it.

The vote in the Senate, on Monday, on Mr. Morgan's motion to take up his resolution abrogating the Clayton-Bulwer treaty throws light on the policy and plans of the opposition to the McKinley Administration. This opposition consists of all the factions that united in support of Bryan in the last election. Their policy is to be that of obstruction. Only fifteen working days of the session are left. The large appropriations have not passed. The Bankruptcy bill, the Pacific Railroad bill, the Loud bill, and other measures deemed important by large interests throughout the country are awaiting action. The calendar is overcrowded and the Senate is rushing toward the 4th of March with every prospect of a hopeless gorge. At this juncture Mr. Morgan solemnly offers a resolution on an abstract question; for, however pertinent it might be at other times, it is irrelevant after the withdrawal of the Nicaragua Canal bill. Of course such a motion is intended to consume time, and on a test vote the Senate sides with Morgan, and takes up this irrelevant resolution to the prejudice of all other business, including the Arbitration treaty. Some Senators who are known to favor the ratification of the Arbitration treaty voted with Morgan, and, therefore, the vote cannot be considered a test as regards that measure; but it points to the carrying of the treaty over the present session, which will perhaps not be the worst thing that could happen. It also points most clearly to the policy of obstruction and deadlock, and it goes far beyond the matter of the Arbitration treaty. The theory of the silverites of all grades and belongings is that, if hard times continue, they will be able to carry the elections of 1898 and 1900. McKinley is pledged to restore prosperity. If for any reason he does not do this, he and his party will be bowled out—so the Bryanites think. Even though their own obstruction to public business is the cause of the trouble, the penalty will be visited upon the party in power, since the people look only to results and do not concern themselves much with details and processes.

There are encouraging signs of a determination among the Republicans in the House to suppress the international monetary-conference scheme which Bill Chandler, with the help of Chairman Jones of the Democratic national committee, recently carried through the Senate. Two New England Representatives took occasion last week to announce themselves for the maintenance of the gold standard and against any more compromises with the silverites. Mr. Knox of Massachusetts declared that the country is upon a gold basis, that it will doubtless continue on that basis, and that it will not initiate an international bimetallic conference. Mr. Hill of Connecticut was even more emphatic in the recent meeting of the House coinage committee. He declared plainly that the Senate proposition is an attempt to bring about the things which the Republican party voted down at the last election—the free coinage of silver and a double standard of value; that the proposition is thrust upon the incoming President by a Senator who bitterly and virulently opposed his nomination; that Mr. Chandler had been sustained and seconded by the chairman of the national Democratic committee; and that no obligation to take such action rested upon the Republican party by reason of any deliverance at St. Louis, because "the stilted phrases of a platform dictated by half-mature thought in June should be read in the blazing light of the November victory." Another Republican member of the committee, Mr. Brewster of this State, characterized the pending bill as "a trap by the enemy to put the next President in a hole." These Republican protestants against the bimetallic folly in Congress find warm support in the press of their party.

There was a suggestive debate in the House last Saturday on the sundry civil appropriation bill. It was begun by Mr. Cannon, who called attention to the fact that, although the bill appropriated $8,000,000 less than the estimates, it carried $17,500,000 more than the same bill of last year. The reason for this is that the monstrous river-and-harbor bill of last year, which the President vetoed and which Congress passed over his veto, provided for contracts for work running over a period of four years, and made certain yearly appropriations necessary. It was not discretionary to withhold the money. It was a very temperate observation on Mr. Cannon's part that, if he could have had his way, he would have waited for an increase of revenue before committing the Government to so large an increase of expenditures; "but," he added, "Congress thought differently." After some discussion on the items of the bill, the debate drifted to the question whether the deficiency of revenue was due to the McKinley tariff or to the Wilson tariff, and Mr. McMillin of Tennessee improved the occasion to give figures showing the progressive decline in revenue under the former measure. These figures, taken from the annual reports of the Secretary of the Treasury, were summarized as follows: "That the McKinley act, during the first four years of its operation, so far failed to produce the revenues necessary for running the Government that the net deficiency for four years was $30,704,000." In addition to this, the sum of $54,207,975, a balance of money deposited in the Treasury by national banks to redeem

their circulation, which had been previously kept as a trust fund, was turned into the Treasury as spending-money and used up. Mr. McMillin's presentation of facts was "taken hard" by Mr. Grosvenor of Ohio. "The McKinley law," he replied, "was producing a surplus year by year until Almighty God, for some purpose that he has never yet made known to the American people, menaced the future of this Government by the election of Grover Cleveland and a Democratic Congress." This explosion, says the *Record*, was greeted by laughter.

The Chicago *Times-Herald* says that the Board of Trade of that city is now convinced that the Interstate Commerce law is worse than useless, that the evils it was designed to remedy have increased under its operation, that discriminations in rates are as great as ever, but more difficult to be traced, and that public opinion no longer sustains it, but demands its repeal. The effect of the act, it says, has been to concentrate the grain-shipping business in the hands of a few large firms, discriminating against the small shippers in whose behalf and for whose protection the law was originally passed. One method of discrimination, for which there is no possible remedy, is that the railroad managers give notice privately to a few large shippers of any intended reduction in rates, and thus enable them to buy up all the grain in advance and hold it till the change of rates is officially announced. Thus the small shippers are as effectually excluded as though discriminations in rates were allowed between different shippers. It does not exactly follow that because the law does not prevent discriminations between different shippers, therefore it is of no value at all. It is true that these discriminations were the cause of the enactment of the law in the first instance, but many other things, good, bad, and indifferent, were embraced in it. The anti-pooling clause is perhaps the worst feature of all. This is considered one of the most potent causes of secret discriminations. If no railroad could gain an advantage by discriminating, it would cease to discriminate. A bill to repeal the anti-pooling clause was before Congress two or three years ago, was favorably reported by a committee, and actually passed by the House, but failed in the Senate for want of time. It is to be hoped that the Chicago Board of Trade may lead the way to the early revival of that measure.

The sudden collapse of the steel-rail pool, with the fall in price of rails from $28 to $18 a ton, should make two classes of our statesmen think even harder than their wont. Trust-investigators must sigh as they see their best efforts eclipsed in a day by simple business conditions. No legislative committee was striking terror to the heart of the steel-rail pool. No laws were threatening them from Washington—in fact, Mr. Dingley and his fellows were hard at work to give the pool a law which would enable them to keep up their prices and withstand the wicked foreigner who might try to ruin an American industry by offering rails at $25 a ton. But in one day the railroad situation and competition send the price crashing down 35 per cent. Suppose a Trust-destroying committee had produced such a result, what pæans would have been sung, how the press would have clamored! But the inevitable march of improvement and reduction of the cost of production do the work, and we shrug our shoulders and pass it all off as a fresh instance of the machinations of capital. But the tariff-makers—how particularly silly they look in the light of steel rails selling at a profit at $18 a ton! Why, McKinley had to give a protection of $12 a ton in 1890, else we should all have been ruined and he never would have been President.

There is much speculation, not as to what the Trust investigation will result in, but as to its object. Why did Mr. Lexow begin it? One theory, and the prevailing one, is that it is meant to cover up, or direct attention from, the Payn blunder; but the Payn blunder was one of those things which cannot be covered up or forgotten any more than the Hill-Maynard blunder. The evidence thus far throws no light on Lexow's deep-seated designs. What it has brought out is that certain persons sell lower than other persons in the same business, and thus ruin their competitors. The way of meeting this by law Lexow has not as yet revealed. Trusts that are corporations can be got at by dissolving the corporations, but Trusts which consist simply of single persons or of partnerships are exactly like Macy & Co., or the Siegel-Cooper Company; that is to say, they are simply persons with large capital, who are driving smaller dealers out of the trade by their lower prices and greater command of money. This process has been going on steadily in all the countries of the world for fifty years. It involves hardships for the small men, but benefits for the consumer. It is one result, and one not altogether pleasant to contemplate, of the working of the principle of competition. It is true that we as a nation have by our tariff declared solemnly against competition. We legislate to keep the market for certain persons. We are enabled to do this easily through our customs duties. But how are we going to keep the small dealers on their legs? There is no way except to give them bounties, or compel the large dealers by law to charge higher prices. But the Constitution stands in the way of such drastic measures. These are the only effective defences against private Trusts that occur to us. Of course direct oppression of small dealers can be punished, but this must be rare. The worst thing that can be done to a small dealer—undersell him—is not punishable. Possibly in the recesses of Lexow's mighty mind some more effective preventive is being devised, but we cannot guess it, and the investigation does not reveal it. There is no reader of mediæval history who is not familiar with the road on which the little man is travelling.

The Bureau of Statistics published on Tuesday its report of the export and import trade of the United States during January. Exports of the great cereal staples frequently decrease during the first month, and merchandise imports usually show a proportionate increase. The result is ordinarily to reduce the excess of exported merchandise to a comparatively low figure, which in the course of two or three months more gives way to a large excess of importations. Exports of breadstuffs did, in fact, decrease last month some $4,673,648 from December's record, contrary to our experience in January a year ago. The cotton exports of last month similarly decreased $11,899,494 as compared with the month preceding. Chiefly as a result of these reduced shipments, the total merchandise export for last month falls $22,243,035 below the phenomenal December record. But the change is so far normal to the month that the January exports of 1897 are $8,000,000 in excess of 1896, and make up the largest total export for the month ever recorded except in 1892, after the huge American crop and European harvest failure of 1891. Meantime the country's import trade has continued almost as light, comparatively, as it was in the closing months of 1896. The January importations prove, in fact, to have been $6,628,918 less than the imports of December; they fall below the January import trade of 1896 by more than $17,000,000. As a necessary consequence, the foreign commerce of January has added materially to the already enormous merchandise trade balance in our favor.

To the general public the most important feature of the five-years' agreement between Yale and Harvard, just signed by plenipotentiaries of the two institutions, is the provision that "all contests, with the exception of rowing races, shall take place on college grounds." A similar rule can hardly fail to be adopted by Yale and Princeton for their future meetings. With the enforcement of this radical change, the most serious objection to college athletics as practised of late years will disappear, since we shall be spared the spectacle of young men, nominally engaged in obtaining an education, drawing crowds of city idlers to bet upon their chances of winning a match. The permanent subsidence of the "athletic craze" is plainly marked by this evidence that college men have at last recovered their

senses, and now appreciate the discredit they have brought upon the cause of education by their excesses.

A Spanish statesman, Señor Moret, in a lecture before the Madrid Ateneo, asserted that the ignorance of American politicians in matters relating to Spain is incredible. Unfortunately for us, he proved his assertion by citations from the escapades of Senators Sherman, Morgan, Cullom, and Cameron; and, as *Dogberry* says, having been clearly proved, it will shortly be believed. Sherman's blunders are historic, but then (we think Señor Moret ought to have explained) he is ready on demand to alter sentiments that do not suit, and to correct his history and international law according to the exigencies of the hour. As for Morgan, his name and fame have reached Spain in a way to delight his soul. We understand that in Barcelona to call a man "a Morgan" is a form of the deadliest insult. Sailors on shore will put up with many kinds of abuse, but they will not stand that. No, we cannot blame Señor Moret if he charges American politicians with ignorance on the Cuban question. But let him observe their refreshing silence of late. Many a man has gained a great reputation for wisdom by looking preternatural things and saying nothing; and how gladly would we all attribute wisdom to the Senate on those terms!

Dr. Theodor Barth delivered a lecture last month before the Liberal Electoral Union of Berlin on the practical working of American politics, which is published in the Berlin *Nation* of January 23. Dr. Barth will be remembered as the intelligent visitor who was in this country during the closing weeks of the Presidential campaign, and whose forecasts of the result shone so brilliantly by the side of those of the cock-sure English bimetallists who favored us with their presence and their prophecies. Largely confining himself to dry exposition, the lecturer showed a familiarity with the ins and outs of primaries and conventions, the machine and the boss system, which would be surprising in any foreigner, and seems especially astonishing in a German. Our very political catchwords and humbug phrases Dr. Barth has at his fingers' ends, and expounds, for example, the great principle of "harmony in the party" for the benefit of rogues, as one to the manner born. The boss of New York he describes as an "uncommonly crafty" person, "one Platt" (*ein gewisser Platt*), and the New York Legislature he truthfully declares to be made up of "Platt-creatures" (*Platt'schen Kreaturen*). Almost pathetic is the way he pictures the great body of peaceful citizens (*die grosse Masse der ruhigen Bürger*) as entirely without part or lot in the political control of their parties, and bewildered, while growingly angry, at the boss system. Dr. Barth's assertion that Americans are every day more anxious to have done with bosses, and only waiting to be shown some way to smash them, is one of the best proofs he gives of his close observation of our political life. Bad as are the conditions he is forced to depict—our specific kind of political corruption and our boss system—he yet denies that Germans have any reason, on the whole, to vaunt themselves over us. The quiet submission of an intelligent people to a reactionary set of young Prussians, such incidents as the Tausch press scandals and the Brüsewitz military murder, make American public life seem, by contrast, says this frank German, "a higher form of civilization."

The sugar bounties which M. Méline is getting the French Chamber to vote by such narrow and precarious majorities, are defended by two arguments. The first is the famous per-capita argument. The price of sugar will go up, of course, but the increase will not amount to more than ten cents a head. Think of people objecting to a burden of 10-365 of a cent a day! How petty such a fraction makes them look. Some other tax also will be required to pay the bounties, but trust us to find that. Anyhow—and this is argument number two—we have got to do it in order to get the better of Germany. She pays a bounty of 50 cents the hundred kilos. We will pay one of 80 cents, and where will she be then? Some scoffers in the Chamber, like M. Méry, pointed out the declining consumption of sugar in France, and asked if the main object was to produce sugar or to have and enjoy it. He affirmed that the English were the only ones to see the point of the joke, as they were laughingly saying that they got all the sugar—consuming four times as much per capita as the French—and let the other fellows have the industry. But this poor-spirited point of view was treated with the contempt that it deserved. It is well for us to accustom ourselves to these powerful arguments for bounties, as we shall hear much of them when Congress gets to work on the tariff again.

Since the massacre of Scio in 1822, none of the Greek islands has given the Turks so much trouble as Crete. After many insurrections, it got a sort of constitution in 1866, but this did not stop the insurrections, because the Turks were constantly violating it or failing to carry it out. In the meantime, Crete lying so near Greece, the Christians, who are in a great majority, have been continually longing for annexation to Greece, and they made a frantic application for this to the Powers at the Berlin conference in 1877. But Disraeli was afraid to weaken Turkey, and the others did not care. So the mutual bickering between the Turkish authorities and the Christians has continued, varied by occasional little wars and massacres. It was supposed some months ago that the Turks would fulfil their engagements, but they have not, and now there is more war, in which the Greeks are crazy to take part. The end might have come fifty years ago but for the policy of minimizing by England every concession made to the Christian population of Turkey. The horrors of the Greek war of independence were ended by a battle which the British Minister spoke of afterwards as an "untoward event," and the sternest reprimands and discouragements were sent to the Bosnians and Herzegovinians and Montenegrins when they rose in 1876. It has long been the policy of the Philo-Turks to treat the discontent of the Christian population with Turkish rule as in some sense criminal, if it results in agitation or revolutionary attempts, because it "endangers the concert of the Powers," as it does now.

The independent line taken by Greece in behalf of the Cretan uprising, apparently in half-defiance of the Powers, might easily lead to more serious consequences than it probably will. While the European concert has been called a "syndicate for peace," it might also become any day a syndicate for war. That possibility is what has been creating uneasiness in business circles on the Continent, leading to the difficulty, which has been reported from different money centres, of putting through contracts of any magnitude. It is all very well to tell bankers and investors that the Powers are bent on a peaceful solution of the Turkish question. That they may well believe, and yet have a reasonable fear that the chapter of accidents may unexpectedly produce war. What they have pointed to as most likely is some fresh massacre or some uprising in Macedonia. The sudden determination of Greece to annex Crete does not seem to have figured in any of the forecasts, yet it is precisely one of those unforeseen events which have been feared as likely to result in a great war. But, as we say, that result does not now seem probable. The Powers, if earnestly resolved to keep the peace, will easily be able to keep it despite this flurry. But what they must be sharply reminded of by this somewhat spectacular outbreak is the fact that the evil of Turkish rule is one that cries to Heaven for remedy, and that it is their business to apply it speedily and effectively. That, and the fact that, as Mr. Gladstone telegraphs, they "have characters to redeem," cannot now be lost sight of in all their delicate and difficult negotiations. One thing they have done very thoroughly, if nothing else—filled the whole Levant with the belief that the fall of Turkey is near at hand, that she is tottering, and that a little push would send her over.

COL. BLISS AND THE PRIMARIES.

Col. Bliss's letter to Gen. Tracy which appeared in the *Evening Post* of Thursday last, met the prophecies of Messrs. Tracy and Low, that in some mysterious way better men will get into the Municipal Assembly in Greater New York than have got into such bodies in our cities during the past forty or fifty years, by affirming that neither party will present as its candidates men who ought to be intrusted with the powers given. Col. Bliss agreed also with the view we have taken, that the surest way to provide good government for the enlarged city is to proceed along the line of experience, and vest the powers of government in our Board of Estimate and Apportionment and heads of departments, which are as truly representative of the people as the proposed Municipal Assembly. Important, however, as was the letter touching the character of the Municipal Assembly, it was still more important as regards our nominating system. Col. Bliss is an expert in the management of this system. He has worked in it and over it for more than twenty years. He knows all about it as it exists and has existed in this city. Twenty-five years ago, if we had complained of its results, he would have asked us scornfully whether we went to primaries, and what we knew about primaries, and he would then have loaded us with abuse for complaining of primaries without going to them. There was a theory afloat about that time, nor is it yet by any means extinct, that all abuses in the American government were due to the absence from primaries of the well-to-do classes, and that as soon as they put in a regular appearance at them, the nominations would become satisfactory. We are afraid to say offhand that Col. Bliss himself held this theory at that time, though we timidly believe that he did, and that we could prove it, but we decline to do so.

His confession, therefore, that respectable people will not go to primaries, and that, if they did, they would find there a cut-and-dried nomination prepared beforehand, of which they in all probability could not possibly approve, and that any municipal legislature produced there would be unsatisfactory, is a very important contribution to current political discussion. It is not important only for city affairs, but for State and national affairs. Platt, Gov. Black, Payn, the State Legislature, and the New York delegation to Congress are all the work of primaries. Nay, they are, as far as this city is concerned, the work of notoriously fraudulent primaries. We know of no proposition in politics so plain as that no improvement in the quality of our legislative bodies can be expected as long as the present mode of nomination for office is persisted in. The device of throwing the protection of the law round them, from which some people expect a great deal, will evidently prove futile, because, as Col. Bliss shows, people will not attend them, whether legal or not. Lauterbach will be there, the Progressive Gruber will be there, and the Trojan Van Allen will be there, and the Wicked Gibbs will be there, but the average busy citizen will not be there, because he will feel certain that he will be unable to influence the result, and because he has other things to do. To get him to vote at elections, unless in times of great excitement, is hard work; to get him to vote for the nomination of somebody for office, when he knows his vote will count for nothing, will be simply impossible.

In short, Col. Bliss's letter is an admission, coming from a responsible quarter, that our nominating system, after seven ty years' trial, has broken down. But it has not simply broken down. In its present dilapidated condition it is carrying our Government to destruction. It is creating bosses all over the country, and putting the State Governors and Legislatures, and therefore the United States Senate, within their control. And these Governors and Legislatures have consequently become indifferent to public opinion—ostentatiously indifferent—to a degree, we venture to assert, never before known in a parliamentary country. In New York to-day we have a boss, a Governor, and a Legislature to whom the remonstrances of the church, the press, the colleges, the boards of commerce and trade, the instructed classes—in other words, the chief organs of civilization in every country—simply afford food for merriment. That Gov. Black meant to designate the utterances of these classes and corporations by his terms "intolerant criticism" and "irresponsible clamor," there can hardly be a doubt. Little by little, year by year, we have seen our government drifting away from the leading agencies of healthy progress, or even peaceful progress. We know that, emanating from primaries, it can hardly do otherwise.

Nevertheless, in the teeth of the plainest facts of the day, we have the Charter Commissioners proposing to extend and perpetuate the power of the primary over our affairs, and they are even bold enough to predict that the officers the primary turns out will improve, the larger the area over which they rule and the more money we give them to handle. The solemn truth is, that the chief work before reformers to day is the contrivance of some mode of nomination which will give the voters of each party a free choice of candidates and will open wider the gates of public life. From public life nearly all our talent and character is now excluded. You find it everywhere else, in our colleges, in our railroads, in business, but you do not find it in politics. And if you ask nine-tenths of the men of character and talent, whom you think peculiarly fitted for office, why they do not take office, they will tell you that the vexations, uncertainties, and base compliances of the primaries and conventions are too great, that to get in and stay in, they would have to keep on good terms with the degraded and corrupt animal known as the boss. The other tenth could not get in if they wished to do so. In other words, the nominating system is too odious to them.

THE TARIFF MUDDLE.

Two events of prime importance to the coming tariff bill have taken place during the past week. One of these is the breaking of the steel-rail pool, the other is the final disagreement of the wool-growers and the woollen-manufacturers on the subject of the rates on raw wool. Both these events must, we think, have a considerable influence on public opinion; that is, on that portion of the community which is in a wavering state of mind regarding protective tariffs in general, and opposed to the very high duties of the McKinley tariff of 1890. Among these Mr. McKinley himself may perhaps be counted at the present time. Certainly a very large division of his supporters in the recent election may be placed in this category.

The breaking of the steel-rail pool and the reduction of the price of rails from $29 to $17 per ton is an event of almost startling significance. It discloses two facts that the tariff-reformers have long insisted upon, namely, that rails can be made in this country as cheaply as anywhere in the world, and that the effect, if not the purpose, of the protective duty is to enable the rail-makers to charge more to the domestic than they do to the foreign buyer. The sudden fall of $12 per ton, and the rushing business that the mills are doing at the reduced rate, are ample confirmation of another doctrine held by the tariff-reformers, that the prohibitory duty which has generally prevailed enables the "combine" to make enormous and unjust profits in times of business activity, when the demand for rails exceeds the domestic supply, whereas, if foreign rails could be bought at such times, the price would never much exceed the cost of production with a fair profit added. Some of the trade journals which are not under the influence of the combine have, during recent years, repeatedly warned the rail-makers that they were standing in their own light, and that a day of reckoning could not be much longer averted, meaning that the public would some day be angry enough to tear down the whole tariff, so far as they were concerned, and leave them to fight the competition of the world without any protection whatever.

The outcome, however, has been quite different. The long period of dulness in the mills has broken the combine, and they are now selling at prices below the reach of European competition. Under the present conditions a protective duty is worthless. It is a mockery, an insult

to common sense, a stigma on the intelligence of the people who tolerate it. If the demand for rails should exceed the producing capacity of the United States, then the tariff would enable the combine to recombine and charge higher prices than they ought to have; but this is not likely to happen. The room for new railway construction is a restricted area, while the power to produce rails is limited only by the capital and inventive skill of those engaged in the business. This is the cause of the breaking of the pool, and it is pretty safe to say that the break will not be repaired, at all events that the old prices will not be restored, very soon. The object-lesson is a very useful one.

The disagreement between the Ohio combine that calls itself the National Wool-Growers' Association and the National Association of Woollen Manufacturers promises to cause more trouble to the tariff-makers at Washington than the broken steel-rail pool. Indeed, there is no reason why the latter should cause any trouble, since they can simply ignore it altogether. They cannot ignore the fact that Judge Lawrence and his coterie demand rates of duty on raw wool which the manufacturers absolutely refuse to agree to. The history of this disagreement goes back to the year 1883, when the wool-growers, under the lead of this same coterie, demanded certain rates which they did not get. It was their persistent clamor for higher rates that led to the McKinley tariff of 1890. Without them there would have been no such bill, no political upheaval in the autumn of that year, and no defeat of Harrison in 1892. The whole tariff enormity that broke the back of the hitherto patient public was piled on top of the wool schedule of that year. Even then the Ohio coterie were not satisfied. No sooner was the bill passed than they began to find fault with it and to threaten this and that unless the rates were raised. The only result of their mendicancy was the repeal of all duties on wool in the Wilson bill. That this repeal has been a blessing to the country there is no doubt, but, of course, it did not allay the cravings of Lawrence & Co. They have been as persistent and grasping as ever, and have presented the following schedule of rates as the minimum of their demands:

"Twelve cents a pound on class 1 and class 2 wools; double duty on washed, and triple duty on scoured; 8 cents a pound on all carpet wools, and double and triple duty on washed and scoured, and 3 cents a pound additional duty on all skirted wools."

Upon this exorbitant and insufferable schedule a two days' conference has been held at Washington with the woollen manufacturers, who offered to concede 8 cents on class 1, 9 and 11 cents on class 2, and 32 per cent. ad valorem on class 3, or carpet wools; the last-mentioned rate being that of the McKinley tariff, which nearly ruined the carpet-manufacturers. The Philadelphia *Press* issued a very moving appeal to the wool-growers not to ask too much from the manufacturers, but to keep within bounds, alleging that the manufacturers wanted nothing but what was fair, that they were guided by wise counsels and moderate desires, and that they only asked living rates. The effect of this pathos was *nil*, for the wool-growers abated not one jot of their demands, and the conference ended in a total disagreement. We fear that the arguments addressed by our esteemed contemporary had a tendency to steel the hearts of the wool-growers, for the *Press* began by telling them that they were "struck down" by the Wilson tariff and that they are "utterly prostrate"; also, that their prostration has been "one of the most potent factors in the disastrous depression of the past four years." If the wool-growers believe this, they will naturally fight all the harder for the tariff they want. But if they were really prostrated by the Wilson tariff, why did they bring to market 270,000,000 pounds of wool in the year following the passage of it? That does not look much like prostration, and they might not know the dreadful condition they are in unless the newspapers reminded them of it from time to time.

Lawrence & Co. may think the world will come to an end if a Republican tariff is enacted which is not agreeable to them. Yet such a thing has happened before. It happened in 1883, and the party prospered fairly well until 1890, when the wool-growers had their innings, or thought they had. Probably Chairman Dingley would like to present a schedule of wool and woollen duties to the House and say, "This is what both the parties in interest have agreed to." It would be very much in the line of precedents to assume that any agreement for distributing the plunder of the consumers of woollen goods must be satisfactory. Alas, this is not possible now. One or the other must be disappointed, and we think that Lawrence will be that one. At any rate it is a very pretty quarrel as it stands, and the public are likely to get some advantage out of it in the end, even though there may be a temporary increase in the price of woollen goods.

THE GOVERNMENT AS A PUBLISHER.

THE Senate has become such an ingenious machine for blocking good and expediting vicious legislation that one specification more or less seems hardly worth making. But a bill now sleeping the sleep of death in a Senate committee is so suggestive both of the stupid confusion and waste attending Government business and of the dead mass of prejudice and inertia that has to be dynamited out of the way of the most simple and rational reform, that comment upon it is a public service. We refer to House bill No. 8237, "To improve the printing and binding methods of public documents." This bill was the conception of Mr. F. A. Crandall, Superintendent of Documents, and was by him submitted, in the first place, for examination and criticism, to all the members of Congress, all the publishing bureaus of the Government, all the depository libraries, and to one thousand private citizens who had shown an interest in public documents. Approved almost unanimously by them, it passed the House on May 7, 1896, with several minor changes. But it could not get out of the committee in the Senate last session; it is now asserted that it cannot this session. Senators declare that Superintendent Crandall and Public Printer Benedict have not displayed the requisite "tact" in urging the bill. So they are bound to strangle it.

But if not "tact," Mr. Crandall has at least displayed force and lucidity of exposition in his account of the belated and benighted methods at present in vogue in the Government Printing-Office. This he has done in his second annual report. The methods in question are forced upon the Office by antiquated laws. It was to cure their absurdities, and the chaotic practice that has grown up under them, that his bill was introduced. It did not call for the appropriation of a single cent, nor cut off a single book now printed. It simply proposed to introduce order and simplicity into a department where chaos and old night now hold sway, to make Government publications more speedily available and convenient to all concerned, and to do it at a great saving of time, temper, and money. To urge such a bill upon the Senate, as at present constituted, is of itself a "tactless" thing to do, we confess, and we must no doubt submit for the present to a continuance of the inveterate evil.

What a huge and needless evil it is, Superintendent Crandall shows to demonstration. Take the matter of delay in publication. The extreme to which this has gone in the census reports is generally known. But there are other series of Government books in which the hair has almost equally grown in the shaving. In fact, says Mr. Crandall, "as a rule the libraries get their books anywhere from one to seven years after Congress has had them, and usually long after their current interest has quite evaporated and they have passed into the dry-as-dust stage of their existence." For example, a sheep-bound volume containing the receipts and expenditures of the Government in 1889 reached the libraries last summer. This was at the very time when all Government documents bearing on public finance were in eager request, and when the sending out of such moss-grown volumes seemed a peculiar impertinence. "At this date," writes the Superintendent, the depository libraries have not received "a single document of any kind appertaining to the Fifty-fourth Congress. They have not had a Congressional Directory since the first

session of the Fifty-third Congress, nor a Consular Report since that for August, 1892, which they received in February, 1895. . . . They have not received the annual report on the Mineral Resources of the country for the years 1891 and 1892, though they have received it for 1893."

The deadly pains taken to bury official information under misleading tombstones (they cannot be called titles), and to shoot out masses of unindexed rubbish for the vexation of the baffled inquirer, Mr. Crandall illustrates by many examples. In Washington there are "living indexes" who know how to thread their way through the mighty mazes without a plan that are called 'Messages and Documents,' or some other jumbling name, but, failing such aid, the investigator is soon lost in the labyrinth. The Superintendent tells of a caller from Omaha in quest of a certain document, to whom he remarked that what he wanted was in the depository library at Omaha. The Nebraskan replied that he knew it, and that the local librarian had offered to help him find it, but that a short hunt in the amorphous mass had convinced him that "the quickest and cheapest way to get that book was to come to Washington for it, a journey of a thousand miles each way."

The duplication and hopeless confusion of Government reports, under the present headless system, are enough to make a private publisher's hair stand on end. Librarians and indexers they seem designed to kill outright. Mr. Crandall's exhibit here, which he assures us is only one of many equally flagrant, is worth reproducing. It is the report of the Commissioner of Indian Affairs for 1894. Following are the various disguises and aliases of this volume:

[First—Bureau edition.]

Title-page: "Annual report of the Commissioner of Indian Affairs. 1894. Washington: Government Printing-Office. 1895."
Back title: "Report of the Commissioner of Indian Affairs. 1894."

[Second—Department edition.]

Title-page: "Annual report of the Secretary of the Interior for the fiscal year ending June 30, 1894. In five volumes. Volume II. Washington: Government Printing-Office. 1894."
Back title: "Report of the Secretary of the Interior. Vol. 2. 1894."

[Third—Message and Documents edition.]

Title-page: "Report of the Secretary of the Interior; being part of the message and documents communicated to the two Houses of Congress at the beginning of the third session of the Fifty-third Congress. In five volumes. Volume II. Washington: Goverment Printing-Office. 1894."
Back title—"Message and Documents Interior Dep't. Vol. 2. 1894-5."

[Fourth—Sheep bound Congressional reserve edition.]

First title-page: "The Executive Documents of the House of Representatives for the third session of the Fifty-third Congress. 1894-'95. In thirty-five volumes. Washington: Government Printing Office. 1895."

This is followed by a general index to the thirty-five volumes of executive documents, filling eighteen pages, and then by the—

Second title-page: "53d Congress, 3d session, House of Representatives, Ex. Doc. 1, Part 5. Report of the Secretary of the Interior; being part of the message and documents communicated to the two Houses of Congress at the beginning of the third session of the Fifty-third Congress. In five volumes. Volume II. Washington: Government Printing-Office. 1894."
Back title: "House Executive Documents, 3d sess., 53d Cong., 1894-'95. Vol. 15. Report of the Secretary of the Interior. Vol. 2—1894. Indian Affairs."

Remember that the contents of these volumes are, in all four editions, precisely the same, and that three out of the four titles give not the faintest idea of what is in the book, and then remember that the Senate falls back upon its dignity and demands the most delicate "tact" in asking it to put an end to this monstrous absurdity!

We regret being unable to give more of Mr. Crandall's piquant report. But we advise everybody to read it who wants to see the supernatural wisdom of "the State" in actual operation. The United States is the largest publisher of books and maps in the world; yet it goes on in blind adherence to wasteful and brainless methods that would wreck a private publisher in one week. To introduce the slightest and most obviously rational improvement is a labor of Hercules and a work of years. The liberality of Congress in voting money to put valuable information in the hands of the people is frustrated by statutes and regulations that compel inefficiency and extravagance and confusion worse confounded. We shall get the needed changes in time, if Mr. Crandall despairs not and keeps battering away at senatorial *Dummheit*. But with "the State" making such a sorry mess of the publishing business, we hope it will be some time before it goes into railroading or telegraphing or canalling.

COMMERCIAL ACTIVITY IN EUROPE.

THE remarkable results of the foreign commerce of the United States in the past year have been noticed in these columns, and the favorable features dwelt upon. How far these results reflect general or special conditions can be determined only by comparing them with the trade of other countries during the same or nearly similar period.

In the twelve months of 1896 the United Kingdom imported from her own possessions and foreign countries merchandise to the value of £441,807,335, a gain of £25,117,677 over the imports of 1895, and three times the increase of 1895 over 1894. The increase was about 6 per cent., apparently a small one, but of high importance in so large a trade movement, representing nearly one-half the value of the raw cotton annually exported from the United States. True, the United Kingdom was obliged to make large purchases of food in the past year, and to that one item more than £7,500,000 of the increase was due. The increase that remains points to greatly improved conditions in industry and commerce, for in no class of imports, whether raw materials or manufactured products, whether articles of necessity or of comfort or luxury, is a decreased movement recorded; and in every class but one the increase is notable. When the trade books were closed for 1895, it was found that the increase of movement over 1894 had been irregular, and in most classes the increase was by the hundreds of thousands; in 1896 the increase is regular and general, and is measured by the millions of pounds. The imports of metals showed a decrease of £405,682 in 1895 and an increase of £1,808,744 in 1896. The imports of raw materials for the textile industries increased by £146,803 in 1895 and by £3,996,355 in 1896; for other industries, by £1,023,568 in 1895 and £3,216,343 in 1896. So far from pointing to crushing and continuing depression in manufactures, the trade returns indicate an increased demand for raw materials in the great manufacturing industries. This would not have occurred had all confidence of holding their own at home and abroad been lost among the manufacturers. Fair-traders, if any of that description remain, get up periodical scares over the competition endured by English industries with those of continental Europe, and they may point to the fact that the imports of manufactured products increased in 1895 by £6,700,606 and in 1896 by £5,649,260. But against these figures must be placed the greater imports of raw materials, the necessary basis of British industries and export trade.

The figures of the exports only confirm the better aspects at home and abroad. The markets of the United Kingdom, being free to the products of the world, are distributing centres for these products. If industrial conditions at home are in a bad way, the outward movement of the raw materials imported would show an increase. A greater quantity or value would be sent where a better demand existed, and sold even at a sacrifice to relieve the home market. This was the condition in 1895. The exports of foreign and colonial merchandise rose from £57,961,534 to £59,970,763, an increase of £2,009,229. In 1896 not only was this increase wiped out, but £1,464,000 more was retained at home, presumably for home use. The exports were only £56,466,465.

With this sign of improvement may be considered the exports of British and Irish produce and manufactures. In two years the value has risen from £215,824,333 to £239,922,209, and of this increase the larger part, £14,032,193, occurred in the last twelve months. Since 1894 the exports of yarns and textile fabrics increased by £9,374,807, and of metals and machinery by £8,510,464—figures that do not point to very sorry conditions of these great interests. It would be interesting to show how this larger export movement has been distributed throughout the world, but it must suffice to say that it is

not from the United States that the greatest demand has originated.

Turning to France, the comparison must be based upon the returns for eleven months of each calendar year, which are, however, sufficient to convey a general view of the tendencies. The values of the imports increased 5.2 per cent., or not far from the percentage given by the British movement. The improvement is more marked in French imports than in British, for the imports into France in 1895 were more than 5.3 per cent. less than in 1894, a difference for which prices could not account. That French manufacturers look for better conditions is seen in the larger imports and the decreased exports of raw materials of manufactures. Yet the flow of finished products to foreign markets was only 2.5 per cent. greater than in 1895, showing an increased consumption at home, or an anticipation of a demand to be made in the near future. The total exports of French products of every description mark an increase of 2.6 per cent., against an increase of 11.8 per cent. in 1894. The point to be dwelt upon is the greater imports, which may be taken as evidence of a more hopeful feeling, if not a present realization of greater industrial activity.

Germany presents a striking contrast to France in foreign commerce. The French protectionists have for years been increasing the rates of import duties with the avowed object of becoming independent, as far as was possible, of other countries. To make such a policy effective, foreign trade must be discouraged, and the opinion of those best fitted to judge is that the policy has been carried so far as to narrow and cripple the commercial movement of France, depriving her of her proper share in the world's trade. Certain it is that Germany has in foreign commerce far outstripped France, and is to-day the type of the aggressive merchant, taking every advantage offered in foreign markets, and making a market in the face of keenest competition. True, Germany has made concessions to her agrarian party, and has adopted both corn and bourse laws, and granted bounties direct and indirect on production and navigation, as well as on some exports. All this is costly, and in the end will prove a grievous charge upon the taxpayers who foot the bill. At present, the stimulus is felt in industries and in shipping, and methods of selling have resulted in enlarged trade. The German trade returns, as printed monthly, do not state values, but weights, which makes it impossible to compare them with the French or English. Both exports and imports for the eleven months of 1896 showed a large increase over 1894 and 1895.

England, France, and Germany thus manifest a decided improvement in both imports and exports in the last year. The United States gives a remarkably large export movement, and quite as remarkably small an import. Merely from the commercial aspect this is not so wholesome an indication as is found among our European competitors; yet so long as the currency question remains unsettled, it is well to have the appearance of being able to draw gold from Europe in payment of a trade balance in our favor.

THE MADOX-BROWN EXHIBITION.

LONDON, January 26, 1897.

BY name, at least, Ford Madox Brown is probably better known to-day than he was during his lifetime. In the various books about the Pre-Raphaelites and Pre Raphaelitism, issued within the last few years, he has figured so prominently that it is impossible any longer to ignore the part he took in one of the most memorable art movements of the century. But the many who now recognize his power and influence are scarcely more familiar with his work than were his sceptical contemporaries. It is true that his "Christ Washing Peter's Feet," his noblest and perhaps most beautiful painting, is now in the National Gallery. But this is the one important example in any public collection in London, though, of course, there are a few drawings and water colors at South Kensington. It is in Manchester, rather, where a series of designs by him decorate the Town Hall, and some of his cartoons and one at least of his most famous canvases hang in the Corporation Gallery, that a just idea is to be formed of his actual accomplishment, and, unfortunately, few people think of travelling to that big commercial town to study art. Before his death, even, little had been seen of his work for many years in London. He had long ceased to send to the Royal Academy, which had invariably treated him with something like contempt, the very masterpiece now in the national collection having been skied when submitted to Academicians, and he had not organized an exhibition of his own since 1865. Only very occasionally, as in the Arts and Crafts show of last autumn, has any pretence been made to represent him, however inadequately. For this reason the exhibition of his work just opened at the Grafton Gallery, the first attempt to collect his drawings and cartoons and paintings into one comprehensive and representative whole, is of unusual interest. Moreover, one feels that the collection has been ordered—according to his preferences—entirely independent of the aid or patronage of the Royal Academy, upon which is usually supposed to devolve the duty of honoring England's great artists after their death. He himself resented bitterly the action of Academicians in preparing the Rossetti show of 1882; despite years of indifference, to see them "swooping down on poor Gabriel's works," lent, he wrote to one of his daughters, "new terrors to death." But in his case the Academy has proved more consistent, refusing to hang even one of his pictures in their exhibitions of "Deceased British Masters." The present show has been organized by Mr. Ford Madox Hueffer, who but recently published a very entertaining and sympathetic biography of his grandfather, and who, perhaps, of all men, is the most competent for the task.

Certainly his selection has been so wise and intelligent that the collection enables one to study Ford Madox Brown's career, stage by stage, beginning with the copies of old masters belonging to his student years, and finishing only with the last illustration designed immediately before his death. You can see the work with which, practically, he made his first appearance in England, the big cartoon, "Spirit of Justice," for the Westminster Hall competition of 1845, when he had for rivals, among others, Dyce, and Maclise, and Etty; the cartoon which Haydon thought the only thing in the competitive show worth looking at, "a figure of Justice, and is exquisite as far as that figure goes." Here, too, are the "Parasina," "The Study in the Manner of the Early Masters," and the "Wicliffe on his Trial," painted when he first found a manner and method of his own—pictures that roused the young Rossetti's enthusiasm and led him to write that letter to Ford Madox Brown which was the commencement of their life-long intimacy and, incidentally, really of Pre-Raphaelitism. It was the letter of the story every one by this time has heard; its enthusiasm so surprising the elder artist, used as yet only to ridicule and scorn, that his answer was an immediate visit, himself well armed with a big stick, to the supposed scoffer and player of practical jokes. Then, again, there are the landscapes, "English Autumn Afternoon," "Carrying Corn," in which he seems to have prepared the way for Monet. He was inclined, his grandson states, "to claim that he had started the '*Plein-Air*' school in France." But in his inordinate love of detail, he could not understand that the painter who would give a right impression of light and atmosphere, cannot have eyes as well for every single leaf and blade of grass. It is strange that while one thus discovers in him the germ, as it were, of *plein-airisme*, so, too, one can look to his paintings for that kind of realism usually associated with Bastien-Lepage, to whom, indeed, Englishmen of the so-called Newlyn school turned for models, all unconscious of what had been done virtually in their midst. The Manchester Corporation Gallery has lent the large picture "Work," which was undertaken, Ford Madox Brown himself explained, to prove that the British workman "was at least as worthy of the powers of an English painter as the fisherman of the Adriatic, the peasant of the Campagna, or the Neapolitan lazzarone"—that is, he saw beauty in the British "navvy," just as Bastien thought to see it in the French peasant. The Manchester Town-Hall frescoes could not well be included; but some of the cartoons and two or three of the original small panels from which they were afterwards painted, are here; these giving an idea of the brilliancy of the color and the well-balanced composition which distinguished all the large decorations, with the exception, perhaps, of the last two or three, done when Madox Brown was quite an old man and his powers were somewhat failing.

Besides these more ambitious productions, there are numerous water-colors—some, like the little "King René's Honeymoon" and "The Younger Foscari," gems of color that Rossetti never surpassed; there are portraits in pastel, designs for stained glass, a long series of cartoons of famous men, illustrations (for, like Rossetti and Millais and Holman Hunt, he drew for the wood-engraver in the sixties and thereabout, the greatest period of English illustration); and there are many studies and sketches in pencil and pen-and-ink and crayon. In fact, no phase of his art is altogether neglected. There is even a cabinet decorated by himself, Rossetti, and Burne-Jones, to remind one of his connection with the house of Morris, Marshall, Falkner & Co.,

for which, in his time, he designed not only stained glass, but tables and chairs and other pieces of domestic furniture.

Really, Madox Brown may be said to have heralded the decorative revival for which, as a rule, Morris receives chief credit, and to have originated the idea of the Arts and Crafts Society. He was designing furniture before Morris had come up from Oxford, and attempting to exhibit it in a gallery before the Pre-Raphaelites had sufficiently emancipated themselves from academical tradition to encourage the attempt. It is no wonder that Mr. Hueffer thinks his misfortune was to have anticipated "the 'psychical moment' with everything that he did." The catalogue itself is further proof of this curious feature of his career. Where possible, it is copied from one he issued for his own show in 1865, in which the title of every picture is followed by a long account of the subject and an explanation of its meaning and moral—an example but too closely followed at Toynbee Hall and in other quarters where every picture is supposed necessarily to contain a moral and a text for a sermon.

To pass thus rapidly in review the life-work of Ford Madox Brown is to begin to understand the reason of his large influence upon a few artists, his utter inability to interest others or to please the public. However his art may have been modified or developed by time, in one main essential it continued unalterable to the end. You may divide his work into the three stages generally adopted, since it seems inevitable that every artist should be given his "periods"; you may point to the early paintings in which the influence of the Antwerp and Paris studios where he studied still lingers; to those that succeeded, marked by the fanatical respect for detail that compelled him to work out each separate leaf on the lilac bush he painted until his diary fairly groans under the task; to the latest, characterized by a sensuousness that prized color above accuracy, though, let me add in all haste, accuracy was never on that account discarded. To accept these divisions, however, is not to blind one's self to the fact that the painter throughout his life—when student, when inexorable realist, when colorist—was always, from first to last, an independent, an innovator. By temperament, clearly, he could never have been anything else; but the chances are that his escape from academical or classical leading-strings was all the easier because in Antwerp he studied under Baron Wappers, a leader of Romanticism in Belgium, and because in the artistic Paris of his student days—1840 was the date of his first going to Paris—individuality was the battle-cry of the Romanticists. From Delacroix to Devéria, from Corot to Célestin Nanteuil, from Millet to Gavarni, there was scarce one of them who was not seeking to express his individuality—even if he had no individuality to express, as sometimes happened—whether in painting or etching, in lithography or drawing for the wood-engraver. For what other reason had the red symbol of revolution been flaunted some years earlier at the Comédie-Française, for what other reason had young rebels pledged each other over the Byronic skull drinking-cup of that little café in the Champs Élysées? Madox Brown, young and impressionable, a rebel too by nature, could not have remained quite impervious to the prevailing tendencies of the schools and studios. There was a certain something in the atmosphere to stimulate and quicken his growth—so effectually that when he returned to England, still a mere youth, he was fully equipped to startle a decorous Academy by his independence.

When it is remembered to what depths, of bitumen and commonplace, painting in England had then sunk, the daring of his revolt will be all the more appreciated. How could men like Mulready and Egg and Eastlake and Grant be expected to sympathize with a young unknown painter bold enough to be entirely original in composition and color and treatment, as Madox Brown was from the time he first tried to exhibit in London? No amount of abuse and contumely could weaken him; because he was misunderstood, his individuality was no less dear to him. Whatever he might not be, he could always remain himself, and this was his uncompromising attitude throughout life. The result is a strength, a vitality, a vigor in his work which enforces respect even when one is disposed otherwise to be critical. For the truth is, as is often the case, the determination to maintain his individuality in face of opposition sometimes forced him to extremes. You feel this when he overloads his landscape with tedious superfluous facts, when he insists too peremptorily on the story he is telling or the lesson he is preaching; when, in his portraits, his desire to be scrupulously faithful in giving a likeness, in painting every hair in a beard, every fold in an ugly gown, leads him to forget that his sitter is a living human being made of flesh and blood, and not cast-iron; when his preoccupation with detail leaves him no eyes for the aspect of the scene before him. You begin to question if it is worth while for the artist to be individual, to be independent, if it is mainly to achieve ugliness or eccentricity. You read of the endless labors of Madox Brown over this picture or that, of the sacrifices he made and the discomforts to which he was put, that he might paint out-of-doors, that he might obtain the right models; and then you consider how much better many another painter, with infinitely less trouble, would have suggested actual character.

Take, for instance, "Work," a masterpiece in its way. It shows British "navvies" busy in a Hampstead street; men and background alike studied on the spot. But the men are not really good types, not one of them; Charles Keene, with a few lines, could have given a far more truthful portrait of the British workman. And so conscientiously did Madox Brown copy their rough working-clothes and tools, so much meaning did he pack into the little group, that he forgot to include them in the picture; they have absolutely no relation to the rest of the composition, to the figures of Carlyle and Kingsley, on one side, so well enveloped in atmosphere; or to the two women in big bonnets and crinolines, on the other, who keep their place so admirably within the frame; or to the man and woman on horseback in the middle distance, who serve to divide the light from the shadows; or to the street, with its line of sandwich men, just below in such true if difficult perspective. Here, indeed, is a very serious fault in a painting. And yet the sincerity—if one can venture on a sadly abused word—the dignity of the composition, you feel, would make up for even more glaring defects. And this dignity of composition is seldom missing from any of his designs. He could *fill* a canvas as Barry, I think it was, once said to Haydon, with far less reason for the compliment. He knew how to give a fine decorative arrangement without the prop of classical convention, and he could afford, as most artists cannot, to treat it humorously when he chose. For humor was one of his predominant qualities. One is not surprised to learn that a favorite book with him once was 'The Adventures of Tyll Eulenspiegel.' There is hardly a picture, however serious in motive without its element of fun as naïve as that of the mediæval artist who decorated the cathedrals and churches of Europe, and not to be overlooked in any, even the slightest, estimate of his art.

Another thing which the collection at the Grafton Gallery proves conclusively is that the influence of Ford Madox Brown was as keenly felt in his immediate family circle as among the Pre-Raphaelites. Work is shown by his children, Mrs. Hueffer, Mrs. William Michael Rossetti, and Oliver Madox Brown, and it is amusing to see how devotedly all three deferred to him as to a master. More than this, one or two of the sketches by the son convince one that, had he lived, he would have been a still greater man than the father. But it is useless to speculate on the might-have-been, especially since Ford Madox Brown himself, as the exhibition establishes triumphantly, is sure always to be ranked among the few great English artists of the nineteenth century. N. N.

Correspondence.

CHILD MEMORIAL LIBRARY.

To the Editor of The Nation:

Sir: May I announce, through your columns, that a memorial library is soon to be established at Harvard University in honor of the late Prof. Child? Prof. Child felt in his teaching the need of a special library which should give students of English literature free and convenient access to a much larger collection of books than can be kept on the shelves of the general reading-room in the Library of the University; and he had in mind the founding of a special library through subscription. The endowment of such a library in his name seems, therefore, the most fitting way to perpetuate his memory as a teacher and a scholar.

The committee in charge of the plan began its work some weeks ago by private letters to persons who would naturally feel a peculiar interest in such a memorial. The response to these letters has been both generous and cordial, and the subscriptions amount to $9,500, besides a considerable number of valuable books. The capital will be placed in the hands of the Corporation, and the income only will be expended. Each book will be marked with a book-plate specially designed for the Memorial Library.

The sum already subscribed insures the success of the plan. I write to inform Prof. Child's friends and pupils about the Memorial, and to give all persons who wish to join in it an opportunity of doing so. Gifts of money or of books may be sent to Mr. J. H. Gardiner, No. 18 Grays Hall, Cambridge, Mass.

L. B. R. Briggs, for the Committee.

Harvard College, Cambridge, Mass.,
February 13, 1897.

ONE OF CHAUCER'S SOURCES.

To the Editor of The Nation:

Sir: Some time ago I pointed out the fact that Chaucer used a French version of the *Consolation of Philosophy*, ascribed in the MSS. to Jehan de Meung, to help him in his *Boece* (vide the *Academy* for Sept. 21, 1895, p. 227). Although the evidence on this point is

conclusive, as will appear from the parallel-text edition of the two which I am now preparing for the Chaucer Society, there are many passages in Chaucer's translation where he does not slavishly follow Jehan de Meung, but displays a scholarship surprisingly independent for one who knew so little of the rudimentary principles of Latin grammar. For, despite many assertions to the contrary, the *Boece* shows mistakes numerous enough and great enough to condemn as unfounded any aspirations its author may have had to be considered a good Latin scholar, even when judged by the standards of his time. How, then, did he manage to translate the difficult metres whose subject-matter is often tortuous with scholastic logic, and whose language is recondite with frequent reminiscences of Virgil's Georgics?

The solution of this problem, which I find in the Paraphrase and Commentary wrongly ascribed, at least in its present state, to Thomas Aquinas (vide Obbarius, *de Consol. Phil.*, Jena, 1843, Prolegomena, p. xlix), throws an unexpected light on Chaucer's literary history.

It must be borne in mind that a large part of the instruction given in the Middle Ages was imparted through compendious glosses and scholia on well-known classics. Of these Boethius was one of the most popular. It will be remembered how King Alfred cut his teeth, so to speak, on the *Consolation*, and afterwards paraphrased it in Old English (vide William of Malmesbury Bk. II., § 122, in Rolls ed. I, 131).* Notker translated it into the Old High German with copious glosses; it was done into French five or six times during the fourteenth and fifteenth centuries—in several instances, glosses, commentary and all; and it has been translated into English almost every century from Chaucer's time to ours. The commentaries which grew up about such texts were made to embrace pretty much all the learning of the time that had the slightest connection with the subject in hand.

Such a one was that which appeared in various forms during the fifteenth century, and was connected with the name of Thomas Aquinas. As it contains quotations from writers who flourished after the time of Aquinas, Obbarius suggested that the ascription of it to him might have been due to a confusion of his name with that of Thomas of Maldon, who died in 1404 (vide Tanner, *Bibl. Brit. Hib.*, p. 503, and Pitseus, p. 538). But, whoever wrote it, there is abundant evidence that both Chaucer and the French translator from whom he borrows, in making their Boethius translations, worked with it in a form not very unlike that which has come down to us through some of the early printed editions. It is also a striking fact that the Latin text used by Chaucer, in its departures from that of the other MSS. of Boethius, must have been similar to that of Codex Gothanus III. (Obb.), which was one of the earliest texts to be associated with the Aquinas Commentary.

Though this refers especially to the *Boece*, the matter has an interest more far-reaching, for many of Chaucer's Boethius quotations, which are very numerous (by no means all of them have as yet been pointed out) and are scattered all through his poems, are taken from the Aquinas Commentary, and not from his own *Boece*, nor yet from the Latin text; there are also traces in his work of his having made use of the Commentary independently of the *Consolation*.

Anything like a complete list of these indebtednesses to the book cannot, of course, be given here; but even the few instances cited below will show, I think, that indebtedness exists, and will not be without interest to those of the *Nation's* readers who read and love Chaucer.

(1.) In *Troilus* I. 685, ff., Pandarus insinuates his friendship for the love-stricken youth, saying:

> "For no wight may bireve
> A man to love, til that him list to leve.
> And witeth wel, that bothe two ben vyces,
> Mistrusten alle, or elles alle leve."

In Aq. sig. l, ij (near top),* we have "Vtrumque enim vicium est, et omnibus credere, et nulli," as part of a quotation on Friendship from Seneca, Epist. iii., glossing "Amor dictat sua jura fidis sodalibus," the paraphrase of Boethius Bk. III., m. viii. (Obb. 40, 27). The conjunction of the two ideas in the *Troilus* is significant.

(2.) Again, in the *Tales* A, 1261-1267, we have:

> "We faren as he that dronke is as a mous;
> A dronke man wot wel he hath an hous,
> But he noot which the righte way is thider,
> And to a dronke man the wey is slider.
> And certes, in this world so faren we:
> We seken fast after felicitee,
> But we goon wrong ful often trewely."

In Boethius III., pr. 2 (Obb. 43, 18), we have the same idea: "Animus . . . bonum summum repetit, set velut ebrius domum quo tramite revertatur ignorat." But the note to this passage in Aq. (sig. m, i) is: "Nota quod sicut ebrius scit se habere domum sed . . . nescit quomodo ad eam redeat, sic homines aliquo modo in generali sciunt et cognoscunt summum bonum, . . . sed illi homines . . . nesciunt quo modo ad illud summum bonum peruenire possint." Here we see that Chaucer's only addition is "And to a dronke man the wey is slider." But what an addition! (For *summum bonum* "felicitee," see below, No. 4.)

(3.) In the *House of Fame*, 1920, Chaucer speaks of

> "An hous that domus Dedali,
> That Laborintus cleped is."

In Boethius the reference to the Labyrinth is "inextricabilem labyrinthum rationibus texens," Bk. III., m. 12 (Obb. 69, 1), Chaucer's own translation of which runs:

> "Thou hast so woven me with thy resouns the hous of Dedalus."

But the note to the passage in Aq. (sig. S, iij) is "Nota Laborintus dicebatur domus Dedali," which shows plainly that Chaucer, if he had Boethius in mind, copied the *Nota* and not the *Textus*.

(4.) In the description of the Frankelyn (*Tales* A, 334 ff.), he says:

> "Wel loved he by the morwe a sop in wyn.
> To liven in delyt was ever his wone
> For he was Epicurus owne sone,
> That heeld opinioun that pleyn delyt
> Was verraily felicitee parfait."

Cf. also the passage about Epicurus in E 2021.

> "Some clerkes holden that felicitee
> Stant in delyt."

In Bk. III., pr. 2 (Obb. 43, 13) Boethius writes: "Epicurus summum bonum voluptatem esse constituit." But the note thereto is (sig. m, i): "Epicuruei posuerunt felicitatem consistere in voluptatibus scilicet in crapula luxuria." Here Chaucer imitates the wording of the note and couples it with the Frankelyn's wine-drinking—"scilicet in crapula luxuria."

(5.) Again, in *Troilus* I., 637 ff., Pandarus displays his learning:

> "By his contrarie is every thing declared.
> For how might ever sweetnesse have be knowe
> To him that never tasted bitternesse?"

We have this in Aq. (sig. l., iv.) as note to Bk. III., m. 1 (Obb. 41, 5): "Dulcior est apium mage labor si malus ora prius sapor edat." "Unde poeta—Dulcia non meminit qui non gustauit amare. Namque per oppositum noscitur omne bonum." This passage, both in Boethius and the *Troilus*, is very near to No. 1, and seems more closely related to the Commentary than to the *Romaunt of the Rose* 21819 ff. (Ed. Meon) (cf. *Anglia* xiv., p. 241).

(6.) Again, in *Troilus* I., 1065 ff., Chaucer uses the figure—

> "For every wight that hath an hous to founde
> Ne renneth nought the work for to beginne
> With rakel hond, but he wol byde a stounde,
> And send his hertes lyne out fro withinne
> Alderfirst his purpos for to winne."

In Aq. (sig. y., v., back) (words not found in Boethius I have placed in parentheses): "Sicut enim artifex (puta edificator) formam faciende rei (sicut domus) mente percipiens (*i. e.* prospiciens) movet (*i. e.* producit) effectum operis."

MARK LIDDELL.

CAMBRIDGE, MASS., January 29, 1897.

*For that seems to be the natural inference from Malmesbury's words and the connection in which they occur.

*My citations are taken from the edition of Boethius's *Consolation* printed at Cologne by Henry Quentell in 1493, which I happen to have. Prof. Norton, who possesses also an excellent codex of the *Consolation* written late in the thirteenth or early in the fourteenth century, has a copy of the printed edition of 1491 (Argentina), which Quentell followed very closely, the signatures of the two differing by one page.

THE VENUS OF MELOS.

TO THE EDITOR OF THE NATION:

SIR: I see in the *Débats* of December 13 last a note on the Venus of Melos which, basing its conclusions on entirely incorrect data, comes naturally to an unjustifiable reconstruction of the statue. It adduces a diary of one M. de Trogoff, an *aspirant* on the ship *Espérance*, who, it is pretended, saw the Venus in its perfect state, etc., a month before the arrival of Dumont d'Urville, who rescued it from the Turkish authorities.

This new evidence is, if not a pure mystification, a pure fabrication, as is clearly shown by the official correspondence on the subject. I saw in 1861 the then French consul at Melos, M. Brest, the son of the consul who saved the statue from the Turks; and his account, he having been present when the statue was discovered in its niche, is absolutely contradictory of this new evidence (?). M. Brest, the father, bought the statue when found of the peasant who found it, and the fact that no French ship was in port at the time is clearly proved by the other fact, which results from the official documents, viz., that the Turkish authorities had seized it and put it on board a Turkish ship which was about to carry it to Constantinople, when it was rescued by Dumont d'Urville just then arriving. The fact that the arms were not found with the torso is proved by the subsequent researches of the elder Brest to find them, as shown in the official correspondence of the day, and the statements of the younger Brest (in every respect in accordance with the published documents of the time) are confirmation of them too strong to be questioned by any such doubtful evidence as that given by the hypothetical M. de Trogoff. If M. Salomon Reinach would take the trouble to look into the records of the navy, which must still be accessible, I think he would be able to show that the supposed M. de Trogoff is a fiction. At any rate,

the unquestionable passage of the history of the discovery, that the statue was taken possession of by the Turks and that its rescue by D'Urville made a diplomatic difficulty at the time, shows that no French ship-of-war was in port when the discovery took place.

The elder Brest, in his last days, under the suggestion of people who had theories to establish, made some curious variations from his original official report, one of which made the niche in which the statue was found a Byzantine chapel; but at that age the memory is subject to all kinds of vagaries, and the documentary evidence of the time cannot be impeached by the late and unsupported statements of the "aspirant" or of M. Matterer. The younger M. Brest, who has lately died, was a man in the prime of life when I saw him at Melos, and his recollection of the matter not only was in agreement with the statements of the original official documents, but was confirmed by another man of Melos, who for many years was the official pilot of the American men-of-war which went to Melos as a station for supplies. If there is anything absolutely determined by the contemporary and official evidence with regard to the finding of the statue, it is that it was found without the arms, and the bringing forward testimony of a purely apocryphal character like that of M. de Trogoff, unconfirmed in the least detail by the unquestioned official documents of the time, is trifling with archæology.

The niche shown to me in 1861 was a rude recess in a garden terrace-wall, intended to serve at the same time as a support to the higher ground above it and to form the boundary of the field in which it was; no structure or signs of building were to be seen near, and it was a long distance from the unfinished theatre, of a Roman date, with which it has been sometimes sought to establish a connection for the statue. There were no ruins of any kind there, and the statue had evidently been simply hidden there. The whole wall was so unsubstantial that when I went, a few years later, to photograph it and the niche, it had entirely disappeared - as M. Brest assured me, owing to excavations in search of antiquities. My second visit was in 1879 or 1880, and the reminiscences of M. Brest perfectly agreed with what he told me in 1861. All the details are to be found in my 'On the Track of Ulysses,' of which I have not a copy accessible at this moment; and they were written down while I was yet fresh from my conversation with Brest.

Now, what is more to the point is the fact that Brest had not got the official documents at my first visit, and therefore could not have based his version on them, but gave me his personal recollections, which were clear and precise, as they generally are with people who read little and write less. He knew nothing of the discussions which have since heated the world of archæology on the subject, and had no temptation to confirm anybody's views. His absolute agreement in all essential particulars with the official correspondence, which I did not at that time myself know, is confirmatory evidence of the strongest character that the arms were never found. When they cleared out the niche, they hoped to find the arms at the bottom of it, which they would not have done had they been in their place.

Yours truly, W. J. Stillman.

Rome, February 2, 1897.

THE BURNING OF NORFOLK.

To the Editor of The Nation:

Sir: In connection with Mr. William Henry Sargeant's communication, in No. 1649 of the *Nation*, regarding the joint responsibility of British and Americans for the burning of Norfolk in 1776, the following passage from Hildreth's 'History of the United States,' vol. iii., pp. 117-118, may be of interest:

"After a descent on the eastern shore of Virginia, to whose aid marched two companies of Maryland minute men, being reinforced by the arrival of a British frigate, Dunmore bombarded Norfolk. A party landed and set it on fire. The town was mostly built of wood, and that part of it nearest the water was rapidly consumed. The part which escaped was presently burned by the provincials, to prevent it from becoming a shelter to the enemy."

A footnote to the brief account in Holmes's 'American Annals' (ed. 1805), vol. ii., p. 368, concludes:

"The provincials themselves destroyed the houses and plantations near the water, to deprive the ships of every source of supply."

Mrs. Mercy Warren's 'History of the American Revolution' (ed. 1805) has a similar note (vol. i., p. 203), but less positive:

"It has been asserted by some that the inhabitants themselves assisted in the conflagration of Norfolk, to prevent Lord Dunmore's retaining it as a place of arms."

William MacDonald.

Bowdoin College, February 13, 1897.

EXAMINATIONS FOR ENTRANCE TO GERMAN UNIVERSITIES.

To the Editor of The Nation:

Sir: Permit me to correct a misleading statement on the part of "A Californian Teacher" in your columns with regard to the entrance examinations for German universities. It leaves the impression that the result of such examinations is dependent upon "a board of Government examiners," and not on the teachers of the particular high school from which the candidate is about to be graduated.

The examinations for admission to the universities are held at the high schools (*Gymnasia*, *Realgymnasia*, *Oberrealschulen*). The examining board consists of the teachers of the senior class (*Prima*) of the school, a Commissioner of Education (*Schulrat*) of the Province, and, in case the school is not exclusively supported by the Government, a representative of the patron of the school. In the absence of the Commissioner of Education, the principal (*Director*) of the school takes his place in the examining board. A number of topics for the written examinations preceding the oral examination are proposed by the several teachers of the high schools. From these topics the Commissioner makes his selection. Both written and oral examinations are conducted by the teachers of the high school, the latter in the presence of the Commissioner. The successful passing of the candidate, however, is exclusively dependent upon the votes of his own teachers, and not subject to the approval of "a board of Government examiners." * * *

Notes.

The Berlin Photographic Company, No. 14 East Twenty-third Street, New York, has in preparation 'The Masterworks of the Prado Museum at Madrid,' consisting of 110 photogravures from the original paintings.

Shortly to appear is a 'Review of Historical Publications relating to Canada [in 1896, together with some of the more important publications for 1895]', edited by Prof. George M. Wrong of the University of Toronto, with able collaboration. The term "historical" will embrace books of travel and exploration. The work will form Number 1 of a series of "University of Toronto Studies in History." The publisher is William Briggs, Toronto.

A correspondent at Florence of the *Frankfurter-Zeitung* says that it has now been decided to publish the letters of Michael Angelo, more than 600 in number, in the Archivio Buonarotti, and that the first issue is to appear soon. Although Symonds, when he wrote his biography of this artist, had access to the carefully guarded treasure, very much of great interest remains which he could not use. These letters are pronounced extremely vivid and entertaining. In one of them is enclosed a note from Clement VII. urging Michael Angelo to make haste with what he had in hand, "for you know that Popes do not live long." The unpublished letters will also throw new light on the bitter controversy between Raphael and Michael Angelo.

The corporate name of the Joseph Knight Co., Boston, has been changed to L. C. Page & Co., the business remaining as heretofore.

The judicious buyer has choice of two new reprints of 'Sartor Resartus'—one in the liberal and elegant "Centenary Edition" of Chapman & Hall (New York: Scribners), with steel-engraved portrait of Carlyle after Lawrence; the other in the Athenæum Press Series, under the particular editorship of Prof. Archibald MacMechan of Dalhousie College. The latter is intended not for mere pleasure but for study, to clear up the dark places, and to compare "this spiritual biography and the actual life of Carlyle." Accordingly the fairly open text of 271 pages is supplemented by an introduction of 59, and 130 of notes, while Carlyle's index is attended by an index to the notes and introduction. This is very thorough and painstaking work and will be sure of general appreciation. Even what Prof. MacMechan calls the "few holes in *Sartor's* coat which remain to be neatly darned," are pointed out for more fortunate investigators by the sign "not identified."

Mr. Charles Dexter Allen, author of 'American Bookplates,' publishes a new book on his hobby, called 'Ex-Libris: Essays of a Collector' (Lamson, Wolffe & Co.). It contains much miscellaneous information on the subject, and a number of handsomely engraved copper-plates, of which one, designed by Bewick for Joseph Pollard of Newcastle, and a modern American plate, by Howard Sill, for Mrs. E. M. Gallaudet, are the most pleasing. The edition is limited to 750 copies, and is sumptuously printed. The "essays" are hardly of the readable kind.

The Werner Co.'s 'New American Supplement to the Latest Edition of the Encyclopædia Britannica,' of which we have the first of five volumes (A, B), does not pretend to follow the scheme of the parent work. While it indulges in a certain number of general articles, it is mainly compiled on the dictionary plan, and it admits biographies of living persons, with no great strictness as to eminence. Some of the articles are signed, and with good names, but men of real learning and grasp do not always shine in encyclopædic condensa-

tion. Prof. Pattee's article on *American Literature*, for example, does not reflect the excellent qualities of his 'History of American Literature.' The article on *Architecture* is not written by an ignoramus, but it is quite inadequate. Of the hack-work the article on Thomas Benton may serve as a specimen, for style, lucidity, and trustworthiness. Slovenly English abounds, as, under *Bunker Hill*, "The name of the battle is a misnomer. It was fought on Breed's Hill." The pen-and-ink portraits are very ordinary work. We remark in this volume a list of Agricultural Experiment Stations, an account of Building and Loan Associations, and a Bible text in 242 languages.

Dr. W. T. Harris's 'The Spiritual Sense of Dante's Divina Commedia' first appeared in 1889, and has now been reissued, without substantial alteration, by Houghton, Mifflin & Co. There have not been many moderns, in these days of critical editions of Dante, who have troubled themselves at all about such matters. We have all been inclined to make philology, or art, or literature out of a work which the author very clearly intended to be a much more serious matter, and Dr. Harris has been almost alone among recent writers in setting his face like a flint against all that would draw him away from the study of Dante's fashion of conceiving man, his acts, his destiny, and his permanent relation to the universe. Most of us doubt the essential truth of Dante's opinion as to man's relation to society and to God, and we may differ equally at times with Dr. Harris's idea of Dante's conception; but to look at Dante's solution of the problem of free-will and sin through Dr. Harris's eyes is a great help to the clarifying of one's own thought and to the understanding of Dante's most vital doctrines. The book is naturally hard reading.

Dr. Scartazzini again enters the field of Dante literature with a book that at last shows him at his best. His somewhat whimsical judgment often led him astray in his elaborate commentary; his versatility has always counted heavily against him; and his multitudinous handbooks for the study of Dante, though convenient and valuable, have proved in the long run less valuable than they seemed at first sight likely to be. But the present thick volume, the first part (A-L) of the 'Enciclopedia Dantesca' (Milan: Hoepli), a "critical dictionary of all that relates to Dante's life and works," has decided merits. The alphabetical arrangement insures order and facilitates reference (none of the handbooks had an index), and the plan enforces brevity and tends to encourage impartiality. The volume is well printed and strongly bound. It serves in part the purpose of a concordance as well as of a dictionary and an encyclopædia, contains a great deal of bibliographical information, and should recommend itself generally to students of Dante.

A recent careful examination of the Provençal and early Italian theories of love, on which Dante's own theory largely depended, is embodied in Mr. L. F. Mott's 'The System of Courtly Love, Studied as an Introduction to the Vita Nuova of Dante,' an essay presented in candidacy for the doctor's degree at Columbia University (Ginn & Co.). The author not only has mastered more completely than his predecessors a very tangled subject, but has expounded it in a thoroughly clear and orderly fashion, with sympathy of thought and grace of expression. It is strongly to be hoped that he will continue his studies far enough to include Petrarch and the extension over Europe of Provençal and Petrarchan influence.

'Forschungen zur ältesten Geschichte von Florenz,' by Robert Davidsohn, is a sort of appendix of 186 pages to vol. i. of his 'Geschichte von Florenz,' already noticed in these columns. It consists of original documents, and enters into a minuter explanation of some obscure events.

'Die Marcus-Säule auf der Piazza Colonna in Rom,' by Eugen Petersen, Alfred von Domaszewski, and Guglielmo Calderini (Munich: Bruckmann) is a magnificent folio, containing text and 128 plates of photographic reproductions of the figures on the column erected to celebrate the victories of Marcus Aurelius over the Marcomanni and other German tribes. The difficult task of photographing the different groups on a large scale has been successfully accomplished, and the explanations in the text are admirably thorough and scholarly.

A well-deserved tribute to a versatile and exceedingly modest Orientalist is Prof. O. Weise's pamphlet entitled 'Der Orientalist Dr. Reinhold Rost, sein Leben und sein Streben' (Leipzig: Teubner). For more than twenty years Dr. Rost was Director of the Library of the East India Office in London, and no one who ever had occasion to use the rare treasures of that unique collection of books and manuscripts will forget his extreme kindness and courtesy. His knowledge of Oriental languages was extensive and peculiar, and he was very conscientious and thorough as examiner in Sanskrit for the Indian civil service.

'Le Parthénon et le Génie Grec,' published by Armand Colin & Cie. (Paris), is the reissue, under a new title, of a work entitled 'Philosophie de l'Architecture en Grèce,' published in 1870. The author, M. Émile Boutmy, is a member of the Institute and present Director of the École Libre des Sciences Politiques. The book is one of those able, readable, and misleading studies which a very intelligent man makes upon a subject with which he is not very familiar. Greek architecture is a subject which has to be understood by a projection of the mind into a vanished past. The monuments have perished, except for formless ruins, their color has left the walls, the sculpture with which they were adorned has been thrown down or wrenched away. The mental image we form of the Greek temple is a highly elaborate structure, built up of many inferences resting upon the dicta of many expert writers. It will not do, then, for the literary man, the sociologist, the publicist, to assert or act upon the belief that, however little trained he may be in art criticism, he is yet free to write down and publish his impressions as a man of cultivation, with an inherent right to judge of those works which appeal to men of cultivation. The Parthenon is not to be judged of by men of cultivation, but only by those who have studied profoundly the important question what the Parthenon was. This, as the book shows, M. Boutmy has never done. It is greatly to be regretted that, before republishing his book, he did not subject it to the needed comparison with the results of modern archæological research—at the probable risk of non-publication in its present state.

Four essays presented in competition for prizes under the Hodgkins Fund of the Smithsonian Institution are now published and distributed: Argon, a new constituent of the atmosphere, by Lord Rayleigh and Prof. Ramsay; Atmospheric Actinometry, by Prof. Duclaux; The Atmosphere in relation to Human Life and Health, by F. A. R. Russell; and Air and Life, by H. de Varigny. The first essay justly received the great Hodgkins prize of $10,000. All the authors are Europeans.

A portrait of the late lamented G. Brown Goode is frontispiece to the handsomely printed 'Register of the District of Columbia Society, Sons of the American Revolution' (Washington, 1896), and testifies to his warm interest in an organization quite outside of his absorbing scientific pursuits. He died in his forty fifth year.

The *Beilage* to the Munich *Allgemeine Zeitung* for January 19 and 20 contains an article of nearly twenty columns by E. P. Evans, entitled "Zu den communistischen Bestrebungen in den Vereinigten-Staaten," giving a condensed history of the attempts to establish communistic associations in the United States, and the causes of their failure. The chief cause, according to Prof. Evans, is the strong spirit of individualism as opposed to collectivism in the American people, together with a clear appreciation of the fact that capital and labor are forces not antagonistic, but cooperative in promoting the general welfare. There is no country in which the demagogic attempt to draw a line of demarcation between the "masses" and the "classes" is so difficult, and the attempt to array the former against the latter so absurd, as in the United States. The most prominent representatives of the so-called "classes" spring from the "masses," and their descendants, after a few generations, are often merged in the "masses" again. Nowhere else in the world is the process so rapid and continuous by which labor crystallizes into capital, and capital becomes fluid and fruitful, and flows back into the hands of labor through the channels of industrial enterprise.

American students will find it worth while hereafter to spend a few weeks or months at Frankfort, for the city has been so lucky as to secure for its public library the complete collection of books owned by the late historian and novelist Gustav Freytag. It includes no fewer than 7,365 volumes on the history of civilization in Germany from the fifteenth century to the present day, the result of decades of expert collecting. It is considered the most valuable addition ever made to the Frankfort library in the hundred years of its existence, and a special catalogue is to be printed. Freytag divided his collection into twenty-four departments, under the heads of superstitions, miracles, robbers, popular medicine and diseases, money and prices, customs and fashions, festivities, schools, military matters, the Church, songs, Thirty Years' War, etc.

A wide distribution is to be desired for the Report of the Mayor's Committee on Public Baths and Public Comfort Stations for New York City, of which committee the secretary is Mr. Wm. Howe Tolman, No. 105 East Twenty-second Street. A large amount of historical and statistical information is here brought together concerning both American and foreign experience in the lines indicated. The clearness of the matter is somewhat diminished by an eccentric typography, but on the other hand there are numerous photographic illustrations and a bibliography. The relation between intemperance and the absence of public-comfort stations is here suggested, and is likely to astonish those who have given no thought to the subject.

Public spirit in Providence, R. I., has always been deficient in comparison with the

accumulated wealth of the upper classes, and in a city famous for its private libraries a free public library was long in being established. This institution was fortunate in securing from the start for librarian Mr. William E. Foster, whose intelligent and indefatigable administration has brought it to the pass where a new and adequate building is necessary. Efforts to raise a subscription to enable such a structure to be completed at once, came to nothing, but the alternative of building a part has now been removed by the outright gift of $200,000 from Mr. John Nicholas Brown of Newport. The design having been already prepared, erection can proceed without delay. It derogates nothing from the generosity of this gift to say that the Brown family is as appropriately the patron of public libraries in Providence as the Astors in New York.

During 1896, 188 women students matriculated at the University of Edinburgh; of these, 176 were enrolled in the faculty of arts, 3 in the faculty of science, 6 in the faculty of medicine, and 3 in that of music. Moreover, there were 54 non-matriculates, who paid the five shilling entrance fee—the majority for attendance on the music classes—while 68 women medical students were attending the extra-mural lectures with a view to graduation in medicine. In this connection, it is interesting to note that the first woman, Miss Martha Thomas, who competed for a scholarship in the department of arts at the University of Durham, was successful.

Somerville College, Oxford, has recently made a suggestive experiment in self-government, on the same line of educational development pursued by the men's colleges. It has admitted to "membership" those of its old students who have kept a residence of three years and taken an honor examination; thus giving them the right to share in the election of one-half of the Council. This is in line with the present regulations of the Oxford women's colleges as to diplomas and certificates, the agitation for opening the B.A. degrees of the University to women having shown the importance of giving women the opportunity of proving to the public, whose judgment will ultimately decide the matter, that they are qualified for the coveted degree, by examinations passed under regulations, both as to standing and as to residence, which are equally as rigorous as in the case of men students.

—The Harvard University reports for the past year offer nothing sensational. President Eliot himself discusses no special topic. Yet, as heretofore, the volume will amply repay reading by all educators and by all parents interested directly or indirectly in the higher education. Some general statistics pertain more or less closely to similar institutions; as that "nearly half of those candidates who do not offer Greek at admission fail to enter, and that 81 per cent. of all the candidates for admission offer the history of Greece and Rome rather than the history of England and the United States." (The substitutes for Greek are probably harder than Greek, comments President Eliot.) Again, the annual cost of continuations and periodicals is more than half the income from the invested funds of the Library, and is constantly increasing in proportion. Finally, "the evils of cheating at examination and of handing in copied work as original" have reached a pass where suspension and posting are proposed as the only effective remedy. The Dean's remarks on the subject deserve to be made a tract of. Nothing can be truer than his saying that "the curse of College morals is a double standard—a shifting, for the convenience of the moment, from the character of a responsible man to the character of an irresponsible boy." He instances the case of "ragging" street signs as simple thievery, though not acknowledged as such by students who would be quick to denounce and ostracize men caught stealing books from the Library (a standing evil at Harvard).

—For the second time, Radcliffe College figures on an equal footing with other departments of the University in these reports, and is referred to by President Eliot in his summary. Only eight of its thirty-one students who received the A.B. degree at the last Commencement, took it plain, without distinction. "The proportion of distinguished students," adds President Eliot, "was therefore much higher than in Harvard College, the examinations being precisely alike for the students of the two institutions." This would imply, perhaps, not greater ability, but greater seriousness and application, in the young women. We suppose there can be no doubt that they are really more mature, sex apart, and less childish than their male competitors; football and other manly sports to the contrary notwithstanding. The independent annual reports of Radcliffe College (issued since the University's) shows that the men must look to their laurels in scientific and historical investigation. Mrs. Agassiz enumerates several papers by advanced students printed by courtesy in the Bulletin of the Museum of Comparative Zoölogy; Mrs. McDougall's monograph on 'Fugitive Slaves,' and Miss Follett's on 'The Speaker of the House of Representatives'; Miss Davenport's 'Classified List of Printed Material for English Manorial and Agrarian History in the Middle Ages,' already cited for reference to his classes by Prof. Maitland at Cambridge, Eng.; and Miss Thompson's 'The Unity of Fichte's System,' read by request of Prof. Royce at his symposium of Harvard students. For such good work the means of publication by the College itself are as yet wanting. The Dean, Miss Irwin, dwells particularly on the need of a more adequate physical laboratory and a gymnasium; but departmental libraries and lecture halls and dormitories are also held up to the benevolent. Mrs. Agassiz pays a deserved tribute to Mr. Arthur Gilman as the mainspring, in its day of small things, of the College, with which he last September severed his connection.

—The volume of 'Collectanea: Third Series,' just issued by the Oxford Historical Society (Oxford: Clarendon Press; New York: Macmillan), is peculiarly rich in its contents, both mediæval and modern. It opens with some rolls of Durham College, the Benedictine foundation afterwards replaced by Trinity, including what is probably the earliest (1315) catalogue of books provided for the use of a society of students at Oxford, and one of the earliest (1428) inventories of college furniture; and among the seals figured in the frontispiece occurs one that is almost unique, that of a body of "parishioners" (1326). Then follows a very interesting set of more than a hundred hitherto unprinted petitions to King and Parliament, relating to Oxford in the thirteenth, fourteenth, and fifteenth centuries. The nice things the editor of the volume, Prof. Montagu Burrows, a pillar of the Church and of the Conservative party, says of the editor of this particular portion, Miss Toulmin Smith, who has recently become the librarian of Manchester College, the new Unitarian Theological hall at Oxford, are pleasantly symptomatic of the changes taking place in the University. Part III. consists of some contemporary Latin poems, concerning the Town and Gown riots of St. Scholastica's day, edited by Mr. Furneaux with the care he gave aforetime to Tacitus; and Part IV. of a list of the 240 volumes given by William of Wykeham to his foundation of New College. Apropos of this latter, the just remark is made that the friars in their convents with corporate libraries had such advantages over the "unattached" secular students who formed the bulk of the university, that the collegiate movement was an absolute necessity if the friars were not to obtain complete control of the place.

—After this we leap over three hundred years, and come to a series of letters, of which the originals are in the Bodleian, from the second Earl of Clarendon to the Earl of Abingdon, Lord-Lieutenant of Oxfordshire, informing him of the course of Monmouth's rebellion. These are edited with all the thoroughness, exactitude, and complete knowledge of the time which are associated with the name of Mr. Charles Doble. They are followed by a history of the long and futile struggle of Dr. Newton in the eighteenth century to convert Hart Hall into Hertford College, which casts a welcome side-light on academic life. The attention of the English department of Harvard University may be drawn to the rule that "if any Undergraduate, having a *Genius to Poetry*, shall choose to make *Verses* instead of the *Theme* or *Translation* required of him, he may be indulged this Liberty, if the Principal shall think fit, and it shall not be found to draw off his Mind from serious Studies." We cannot refrain from quoting another charming passage, which breathes the patronizing humanitarianism of the century. Dr. Newton believed in early college closing, and the shutting out of latecomers. Otherwise, he moralizes:

"What becomes of the College Porter? Or rather as it should seem, Who cares a Farthing what becomes of him? But still, in a Christian Country, and especially in Colleges erected for Promoting *Religion* and *Moral* Virtue, a regard is to be had to the Happiness of the poorest Creature upon Earth; and tho' All cannot be made equally Happy in their Situations, yet every Condition of Life that can be made Easier, ought to be so. But, if this poor coughing Wretch must be raised out of his Bed, at every Hour of the Night, to answer to the unseasonable Knockings at the Gate of dissolute Men, who consider only what is agreeable to Themselves, and not what Others suffer, there is not a greater Slave in Turkey than a College Porter; and I pronounce that *He* or his *Deputy* shall die a Death immature."

The volume closes with an account of the printing inventions due to the ingenuity or patronage of Charles, Earl of Stanhope (1753-1816), and of his services to the Clarendon Press, from the appropriate pen of Mr. Horace Hart, the present Controller of the Press, forming an interesting chapter in the history of the typographical art. It will be seen that the collection touches an unusually wide range of interests, and it will doubtless be among the most frequently consulted of the publications of the Society.

—'Tales of Naples and the Camorra,' by the late Charles Grant (Macmillan), contains the records of a shrewd and original observer who loved the Neapolitans and the Naples of which he writes, and who has lavished upon these

simple stories all his varied lore as to Neapolitan character, religion, and superstition. Merely superficial local color is, in these days, very easily acquired, but here we have something unique, an intimate and sympathetic knowledge of the *lazzarone*, the *galantuomo*, and the *camorrista* which it seems almost miraculous for an Anglo-Saxon to have acquired. Indeed, the preface confirms what these stories suggest, that the author's long residence at Naples made him the close and confidential friend of a numerous circle in just those humble Neapolitan homes from which a foreigner, and especially an Englishman, is, as such, naturally excluded. Mr. Grant's artistic method is distinctive. The four stories, or sketches, as he calls them, hang together, each one going deeper than its predecessor into the heart of the matter, until in the final story, "Domenico," there is a culminating plot which has a certain connection with the three preceding tales—the whole group forming a sort of novel-writer's tetralogy, and culminating in the tragic retribution which visits Domenico. This *camorrista's* career is pictured with startling sureness of touch, and we are, accidentally, as it were, placed in possession of all the secret ways and works of the Camorra. In such a setting Domenico, who without it would still be a masterpiece of character painting, shows forth as a consummate villain whom it is by no means possible always to abhor, and with whom we sometimes feel an involuntary and most compromising sympathy.

—Dante's pretty little treatise 'On the Vulgar Tongue' (*De vulgari eloquentia*) has had a singular history. It did not see the light until 1529, and then only in an Italian translation. The original Latin was published half a century later, but it is really only within a few years that any attempt has been made to prepare a thorough critical edition of the text. A facsimile of the Grenoble MS. was published in 1892, and Dr. Moore, the first expert to treat the text at all, made use of it in revising the treatise for his edition of the complete works of Dante. What is doubtless the definitive edition, however, now lies before us in the four hundred and odd crown-octavo pages of the first volume of the Italian Dante Society's projected critical edition of Dante's complete works (Le Monnier), on which the learned editor, Prof. Raina, has been employed for many years; the quaint fragment of Dante's philological observation and imagination quite lost in the engulfing mass of modern erudition. This, too, is but a preliminary, for Prof. Raina hopes in a succeeding volume to publish a translation and comment on the content of the treatise, for all here concerns simply the readings of the text. The edition is a monument of acumen and toil, and, in all probability, brings us close to Dante's actual wording; but there are few, in America at least, who are likely to profit greatly by the enormous apparatus. The Italian Dante Society would incur the gratitude of a much larger body of students and scholars, and probably add to its own exchequer, if it would put in the market in due time a simple reprint of the text, with an Italian translation and a few useful notes. Then we must have a new and more accurate English version, and, after six centuries, Dante's suggestive little essay (it is not so different from a doctor's thesis of to-day) will be an open book to us all.

—Paris is stirred to some faint movements of interest or curiosity by the prospect of a new *revanche*. M. Pierre Denis, who was a close friend of Boulanger's, received from him the mission, perhaps the mandate, of taking satisfaction of some of the brave General's unfaithful followers when the proper moment should come. M. Pierre Denis believes that that moment has now arrived, and he is about to take his revenge in a somewhat novel but perfectly characteristic and befitting fashion. He has written a play, and the cowardly deserters are to be court-martialled and executed on the stage of the Nouveau-Théâtre. The piece is in rehearsal, and will be performed on the 16th and 18th of March. The representations will be "private," to avoid the Government censure, but a large number of tickets will be distributed in the political world and in the army. The whole life of Boulanger, from the beginning of his ministry to the final scene in the cemetery of Ixelles, is shown. Around the General appear many of the persons of mark who took part in the Boulangist movement. Some, like Rochefort, keep their true names: these are true friends. The names of others are slightly travestied to indicate their evil nature and bad qualities. The Baron de Mackau becomes the Baron de Kauma; M. Meyer, editor of the *Gaulois*, is called Lévy, director of the *Druide;* M. Mermeix is "éreinté" under the name of Icarus; M. Naquet and Count Dillon also get their deserts, and M. Pierre Denis himself plays the part of Peter the Hermit. Nothing could well be more appropriate than that the Boulangist melodrama should end on the boards of a theatre. In retrospect, and from one point of view, it seems not even a melodrama, but a comedy, or even a farce. Yet for a moment it was serious enough, for the vain, showy, sentimentalist that was Boulanger was once upon the point of precipitating the Third Republic into an abyss as deep as that in which the Second Empire sank.

—A writer in the Berlin *Boersen Courier* has just paid a visit to Eduard von Hartmann. The author of the 'Philosophy of the Unconscious' is now fifty-five years old, and walking (from his old misfortune in the military service) is so difficult to him that he never leaves the house except in an invalid chair. Nor is he able to write more than two or three hours a day, and sometimes he stops work on his books and seeks recreation in writing a few essays or newspaper articles. He has four daughters, only one of whom, he says, has any literary inclinations. He is opposed to current methods of education, his condemnation including the universities, which he calls mere "drill institutes," training-schools for specialists, unable to impart a general culture, which, he thinks, can be attained only by reading books on a large scale. Hartmann spoke rather contemptuously of Nietzsche as a philosopher. He said that both he and Nietzsche owed very much to the influence of Max Stirner; but while he (Hartmann) cheerfully admitted his own indebtedness, Nietzsche was silent regarding it. The visitor having remarked that the vogue of Hartmann's philosophical writings was largely owing to their lucid and popular style, the philosopher surprised him by retorting that he had indeed in his earlier writings taken pains to be as entertaining as possible, but that latterly he had abandoned the attempt to fix the interest by means of antitheses and illustrations, and had adopted the "military style"; explaining that by this term he meant the style used, *e. g.*, by Moltke and Kaiser Wilhelm I., and characterized by the greatest possible clearness, conciseness, directness, and lucidity. This style, he added, was favored by the higher officers in general.

RATZEL'S RACES OF MANKIND.

The History of Mankind. By Professor Friedrich Ratzel. Translated by A. J. Butler. With Introduction by E. B. Tylor, F.R.S. Macmillan Co. 1896. Colored plates, maps, and illustrations. Vol. I., pp. 486.

In introducing this work to the English public, Prof. Tylor characterizes it as a series of "outline sketches," and though he is restrained by virtue of his position from "attacking or defending Ratzel's views on the diffusion of the human species over the globe, the classification of mankind by race and language, and the geography of civilization," he nevertheless does not hesitate to recommend the work as "providing a solid foundation in anthropological study" indispensable to a beginner. Partial as this endorsement seems to be, it is, as far as it goes, "approbation from Sir Hubert Stanley"; and as regards at least the portion of the present volume which treats of "the American-Pacific group of races," it is probably safe to say that, in the sketches here given of the arts and industries, manners and customs, forms of government and religious beliefs of the inhabitants of the Pacific islands, we have the latest word in the story of their development.

Just and fitting as is this tribute, we must not forget that the attempts hitherto made to classify mankind in groups have failed, and that, consequently, ethnology does not yet take rank with the exact sciences. Color of skin, it has been truly said, is often in conflict with shape of skull, and shape of skull does not always agree with texture of hair. Even language, which is probably the best test, is not infallible; and, so far as culture is concerned, the differences existing between tribes of the same generic stock are often so pronounced that what may be safely predicated of one does not necessarily hold good of its nearest neighbor. For this reason, then, as well as because of the resemblances that are found to exist everywhere between peoples in the same stage of development, conclusions based upon resemblances or differences in physical conformation and culture—or perhaps it would be correct to say ethnographical generalizations of any and all kinds—are to be accepted with many grains of allowance. Moreover, it must be confessed that there is no uniformity among ethnologists in the meaning attached to certain terms. Race, for example, may be used in the sense of species, man being the genus; or it may signify, as it does with our author, a mere variety of the human species. Religion, too, is sometimes made to include myths, rites, beliefs, etc., etc.; but to assert (pp. 21, 39, 66, etc.) that among less civilized peoples "it is at once art and science, theology and philosophy, so that civilized life . . . contains nothing which is not embraced by it," is to extend its meaning beyond all limits; and when the term state or kingdom is applied to an insignificant band of savages, or when we are asked to believe (p. 120) that "female sovereigns" are to be found among American Indians, it is certainly time to call a halt and readjust our bearings.

These are some of the pitfalls that beset our path. They are, unfortunately, present in every similar investigation; and though in calling attention to them at this particular time it looks as if we meant to imply that our

author was an especial offender and an unsafe guide, yet, in fact, nothing is farther from our intention. Undoubtedly some of his conclusions rest upon slight foundations, and there are statements which would gain in credibility if the sources of his information were given; but on the whole, even after allowing most liberally for the number of these objectionable features, it is probable that there are fewer errors than might have been expected in a work involving such an immense amount of patient research.

Being thus forewarned, we may now take up our author's story; and, following him back along the path over which man has progressed, we come, finally, in the Old World to two great divisions, the whites and Mongoloids in the northern hemisphere, the negroes in the southern. As there is only one species of man (pp. 9, 10), "the reunion into one real whole of the parts which have diverged after the fashion of sports" is said to be "the unconscious ultimate aim of all the movements" that have taken place since man began his wanderings. This may or may not be true—we do not pretend to decide—but, whether true or not, it is believed to have led to an admixture of the dark and light races along the line of contact, from the northwest point of Africa to the Fiji Islands. As a result of these various mixtures—the negro on one side and the white or Mongol on the other—we have a number of hybrid races scattered about over the earth, some of which have played a not inconsiderable part in their respective spheres. Among these the Malayo-Polynesians (or, as they are here styled, the American-Pacific group of races) are in some respects one of the most interesting. Originating in the southeastern corner of Asia, in a cross (or rather crosses) between the negro and the Malay branch of the great Mongol race, these peoples, under different names and of various degrees of intermixture, have spread over an area covering 210 degrees of longitude and 80 of latitude, thus virtually taking possession of the island world of the Indian and Pacific Oceans. In Madagascar as in Hawaii, and from Formosa to Easter Island, they are everywhere to be found. Even in Australia, where the negro element largely preponderates, traces of the Malay are said (pp. 216, 337) to be visible in the straight hair, prominent cheek-bones, and light-brown tint of the native population.

Whether, in the course of their wanderings, voluntary or enforced, these people reached America is an open question. Our author, however, has no doubt about the matter, for time and again he assures us that America must have been discovered from the west long before the Northmen came from the east; and, basing his conclusion upon the "extension of Asiatic characteristics" over both North and South America, he tells us (p. 154) that the route across Bering Straits was used in preference to that by way of the southeast Pacific. To this conclusion we do not especially object. In open boats, without a compass and guided by the stars and currents, the Malayo-Polynesian sailors had managed to circumnavigate rather more than half the world; and with Easter Island or Japan as a base, there is no reason why they, or some other people of Mongol stock, might not have closed the gap that separates those points from the mainland of America. But, while conceding this, it is well to remember that although, for years, individual Eskimos have passed to and fro across Bering Straits, yet there is no positive proof of intercourse between Polynesia and South America. Such evidence as there is of the fact is to be found in the facility of intercommunication, the resemblances in the arts, industries, manners and customs of the two peoples, and in the agreement which is said to subsist in their religion, their legends, and their bodily conformation. Numerous and striking as these similarities are admitted to be, they are not conclusive, for, granting the existence in eocene times of a land-bridge between Europe and America, it will be found that the reasons for believing in the "affinity" of our Indians with the Mongols are equally efficacious in establishing their connection with the Eurafricans, as Brinton ('Amer. Race,' pp. 30, 32) styles the primitive inhabitants of Western Europe. Indeed, it is possible to go even farther, and, bearing in mind the antiquity of man in this portion of the world, and "the similar manner in which similar needs are met, similar artistic ideas developed, and similar results attained" ('Prehistoric America,' pp. 524–5), we may claim with Dall that the prehistoric civilization of this continent, from "the shell-heap . . . to the structures of Mexico, Central America, and Peru," is distinctively American.

Be this as it may, it is not a point upon which it is safe to dogmatize, for with only one element of the comparison as yet in evidence, the data are not sufficient to justify a conclusion, whatever our author may say to the contrary. When, in a coming volume, we are treated to the promised account of our Indians, we shall be able to institute a series of comparisons between them and their neighbors in Asia and the Pacific Islands which may, perhaps, help us to a knowledge of "the derivation of the old American civilizations." Meanwhile a glance at the condition of these several races with the view of determining their respective positions in the scale of progress may not be without interest. Simple as this process seems to be, it has its difficulties owing to the fact that, although three of these races—the Polynesians, the Micronesians, and the Melanesians—are said (pp. 157-174) to belong to one ethnographical domain, yet, in reality, they differ from each other and among themselves to such an extent that no one picture can be made to serve for all. Unquestionably there is a close connection between them in language, and a certain similarity to be found in their manners, customs, arts, industries, religious beliefs, etc., just as there is among all peoples in the same stage of development. It is also probable that in many of the particulars in which they differ, the differences were of degree rather than of kind. On the other hand, however, the fact that pottery was manufactured in certain islands and not in others, and that only ten years ago (p. 183) "the people on the east shores of New Guinea were still completely in the stone age, while in the west the working of iron had long been known," is believed to indicate differences in culture of such a character that no believer in Morgan's scheme of classification would think of uniting in one and the same class peoples among whom such differences exist.

Other resemblances and differences there are, not, perhaps, of a radical character, but sufficiently pronounced to justify the separate sketch which our author devotes to each one of these races. Thus, for example, taking into consideration the entire group except the so-called American Indian, we find that in some regions agriculture was highly developed; in others it was less advanced; and then again there were localities (p. 337) in which it was unknown. The use of the bow, according to the map (p. 142), seems to have been confined within tortuous limits, as it was common in Melanesia, though practically unknown even in the neighboring islands and Australia. So, too, in their methods of building their houses and boats these peoples differed widely, as they did in their treatment of the women, including under this head marriage, mother-right, etc., as well as in their customs relating to taboo, tattooing, distribution of property, cannibalism, disposal of the dead, and in fact in many other respects. In religion, except in western Malaysia, where Mohammedan missionaries have been at work since the fifteenth century, animism may be said to have prevailed; and in San Christoval the couvade existed in connection with father-right. The quipu (pp. 192 401) was in use in Formosa and elsewhere, and the lasso (p. 418) in Luzon. As early as 1570, Manila possessed guns of native make, though in some quarters stone weapons and utensils are to-day still in use. Mounds were constructed as foundations for houses as well as burial-places, and in one case (p. 307) there is mention of an earthwork in the shape of a lizard.

But it is unnecessary to pursue this subject further. Enough has been said to show that these peoples differed from each other and among themselves; and it will also help us roughly to approximate the places they had respectively reached along the several lines over which it is necessary to pass in the progress from the age of stone to that of iron, or, in other words, from savagery to civilization. Indeed, in this latter respect, the western Malays may be said to have reached the goal, for although they have deteriorated in some of the arts since the time when Brahmin influence was paramount, yet, on the other hand, they now smoke opium (p. 433), counterfeit coin (p. 400), indulge occasionally in the practice of lynch law (p. 450), and insist upon reading the 'Age of Reason' and other free-thinking works (p. 400), much to the disgust of the English missionaries. With such a capacity for "annexing" what is euphemistically termed "foreign culture," what may we not expect of these peoples in the near future?

In conclusion, we may be permitted to call attention to the illustrations, plain and colored, with which the volume abounds. They are taken from specimens in the various European collections, and they convey, in a way no verbal description can attain to, clear and correct ideas of the arts and industries of the peoples with whom we are dealing.

THE COMSTOCK MINES.

The Story of the Mine, as illustrated by the great Comstock Lode of Nevada. By Charles Howard Shinn. D. Appleton & Co. 1896.

THE second contribution to the "Story of the West Series" is a history of mining on the Comstock Lode, and a description of the shifting social and economical conditions of the towns which sprang up upon and around that centre of intense mining activity. Mr. Shinn has done wisely in selecting a typical sample of Western mines and tracing its vicissitudes, rather than attempting to tell the whole story of Rocky Mountain mining within the compass of a single volume; and he has performed his work well. He has refrained from bewildering his lay readers, for whom the book is intended, with scientific terms and technical details. On the other

hand, he has described succinctly and with considerable literary skill the Nevada Desert, while it was still, as Western Utah, under Mormon rule; the discovery of placer gold in the gulches and on the hillsides which derived their gravels from the decomposed vein matter of the great lode; and the struggles of the few early prospectors who were so near to fortune, and yet so far.

Neither Henry Thomas Paige Comstock, who earned immortality on about the same terms as Amerigo Vespucci, nor any of the little group of the first diggers and delvers on the slopes of Mount Davidson, drew a large prize in the great mining lottery they were establishing. In fact, so little did they deserve it that they were not aware that the heavy blue sand which inconveniently clogged their sluices, and which they washed away by the ton, was a pure silver ore. Men of greater foresight, and yet even more unfortunate, were the two Grosh brothers, who in 1857 traced the placer gold to its source, and made locations on the great lode; for one brother died of blood-poisoning from a wound at the mines, while the other perished in the snow while trying to cross the Sierra into California in search of financial assistance. One companion remains of these educated pioneers, Dr. Bucke, superintendent of the insane asylum of London, Ontario, but better known as a disciple and worshipper of Walt Whitman.

These men were the real discoverers of the Comstock. But mining commenced only after Harrison, a Truckee farmer, had had some of the troublesome sand assayed in Grass Valley, Cal., and learned that it carried more than $6,000 in gold and silver to the ton. Then commenced the rush from California into Nevada—at first over trails by pack animals, then by road, and lastly by rail. Two groups of mines, one at the northern extremity of the great lode and the other at the southern, were first opened, and some twelve or thirteen bodies of extraordinarily rich surface ore extracted. From these, between 1859 and 1870, about $145,000,000 of gold and silver was taken. But before the latter date the annual yield had fallen off from a maximum of $18,000,000 to $2,000,000; for the first period of exhaustion had already set in. During the first period of prosperity the most prominent figure on the Comstock was W. M. Stewart, afterwards United States Senator, who is said, out of the $10,000,000 wasted on litigation, to have received in fees alone $200,000 annually. But a still more fortunate lawyer was Gen. T. H. Walker, who is credited with receiving for legal services $4,000,000.

The decline, which was the inevitable result of such extravagance, combined with the metallurgical incapacity and want of foresight of the earlier miners and mill men, brought to the front a group of shrewd California financiers, led by William Sharon, the local manager of the Bank of California, and including W. A. Ralston, D. O. Mills, and others. By foreclosure and judicious purchase they, as the Ralston Mill and Mining Co., were for a time the despotic owners of the mills and most of the productive mines. Their supremacy was shaken through the discovery by the superintendent of the Crown Point Mine, the present picturesque Senator Jones, of a body of ore which was saved from the grasp of the Bank of California syndicate. But a still more formidable opposition was being created by another little knot of men of a type very different from the California bankers, viz., John R. Mackay, James C. Fair, two practical miners on the lode, and J. C. Flood and W. S. O'Brien, two saloon-keepers in San Francisco. Mr. Shinn tells how the former, by their intimate knowledge of every mine on Mount Davidson, and the possession of that wonderful instinct which leads some miners to diagnose the presence of ore as unerringly as an old physician puts his finger on the seat of disease, managed to obtain possession of some 1,300 feet of what was supposed to be comparatively worthless ground between the north and south chains of mines, and to sink a shaft on to the marvellous bonanza which soon made the "Consolidated Virginia and California" mines a by-word for inexhaustible wealth. But he is silent as to the important part the two others played in obtaining information from Comstock miners when their tongues wagged too freely over their cups. Mackay and Fair were, however, the guiding spirits of the quartet, and used the large fortunes amassed out of the Comstock in public enterprises which made them both conspicuous figures in the financial world till Fair's death.

The startling vicissitudes of the mines and of the men who at one moment literally rolled in wealth and were as suddenly plunged in poverty, can best be appreciated by the extraordinary vacillations in the value of the stocks of the prominent mines. Under Senator Jones's superintendence, Crown Point stock rose within a year from $2 to $1,828, and Belcher from $1.50 to $1,525. California, which started at $37 in September, 1874, sold for $780 in the January following, but fell by 1880 to $1.25. The 1,310 feet of the lode which the prescience of Mackay and Fair had induced them to stake their all upon, was worth in '69 less than $50,000, but was raised by their discovery of the great bonanza to $160,000,000 within five years.

The conception of the Sutro Tunnel brought into prominence another man of enormous energy and ability, who is still a power on the Pacific Coast. The tunnel was expected to be an inestimable boon to the mines, but did not reach them until 1878, when the great bonanza was exhausted and the mine workings had reached a depth far below that of the tunnel level, and had been abandoned on account of the poverty of the ore and the excessive cost of working when the temperature of the rock was 130° F. and of the water 170° F.

The history of the subsidiary interests and activities is hardly less interesting than the main theme, the more especially as they were generally instituted and conducted by men untrammelled by experience and precedent, and yet of such acute ingenuity and originality that they devised new methods as a matter of course to meet new requirements. The eighteen- to twenty-mule teams which were strung in one continuous column from Sacramento in California to the mines in Nevada were an invention of the Comstock. Fifteen thousand beasts of burden were at one time employed in freighting between these points; and no service to which the horse and mule have ever been attached displays so wonderfully, not only their endurance, but their intelligence and skill. An exhibition of eighteen thoroughly trained mules harnessed to a train of three wagons, in the hands of an expert Western teamster, would elicit more praise at a Madison Square Garden horse-show than the best four-in-hand driving by a gentleman coachman. Water had to be brought from a distance, and for the first time in the history of hydraulic engineering it was conveyed in iron pipes under a pressure of 800 pounds to the square inch. Lumber, to the amount of over fifty million feet a year, was buried annually in the mines as props and framework to support the walls and roofs of the large excavations; and here again, to reduce cost of transportation from the top of the mountain ranges, where alone pine grew, Comstock ingenuity invented the V-shaped flume in which it was shot down into the valley by the irresistible flow of water. To treat the ores, new machinery was devised and old methods modified, so that a new system of extracting silver still goes by the name of the "Washoe"; and since electricity has come into play for generating motive power, a plant which might have been a model for that at Niagara has been running for years deep underground on the Comstock. The dynamos, set in a great excavated chamber at the intersection of a shaft by the Sutro Tunnel, are driven by turbines moved by the volume of water which descends from the upper levels of the mine.

Thus this extraordinary mine not only produced more gold and silver, but has called forth more inventive genius and has given birth to more men who have become notable in the domains of politics and finance, than any other, not only in this country, but perhaps in the world. And the rank and file of toilers in these mines have exhibited in the performance of their daily task more than even the miner's habitual enthusiasm and endurance. But, better still, when occasions of extraordinary danger arose, the Comstock miner never flinched from facing death with more than the courage of the soldier on the battle-field. His heroism was rather that of the volunteer of "the forlorn hope." In the Western miner we find exaggerated the faults and virtues of his class the world over, but one notable trait he certainly possesses to an eminent degree—generosity. We have known the men of a single mine, and that not a big one, to subscribe $700 to send to a country sanitarium in the East a lad who had been injured in the mine, and who was pining away in the confinement of the county hospital.

The story of the Comstock cannot be exactly duplicated in all its romantic details and its vicissitudes by that of any other mining district; but almost as interesting a book could be written of the underground and surface life of such towns as Leadville, Butte, and Tombstone. At any rate, it would be well if we in the East appreciated better than we do the bright side of Western life. The shady side has been too often described in darker colors than should be employed to depict the average condition of Western society, which is, after all, made up from the most energetic and adventurous elements of the East. As long as the West offers excitement, so long will the class that frets under the restraints of highly organized society seek the West. Only when the West becomes more thickly populated, and when every man there must cease to be a law unto himself, will the restless elements of our Eastern population turn as of yore to the sea. One cause of the decadence of our mercantile marine will then be removed. As it is, sailors compose a very large proportion of our Western mining population.

A STUDY OF CROWDS.

The Crowd: A Study of the Popular Mind. By Gustave Le Bon. Macmillan Co. 1896.

THE French work of which 'The Crowd' is a translation is entitled 'Psychologie des Foules,' and belongs, as the author affirms in his preface, to no school. It is put forward

however, as a scientific book, and consequently, as it stands by itself, it must be examined as a scientific inquiry in which the author not only discusses a subject, but invents and explains the method of investigation as well. M. Le Bon has, in fact, a method of his own for studying the popular mind, which is so peculiar as to defy not only classification, but even definition. At bottom it rests upon a single postulate—that a crowd is not a mere collection of individuals, but an organism which is governed by laws of its own; it follows that these laws, under which the organism acts, must be studied and analyzed. The author, therefore, proceeds to describe crowds; the present age being, in his opinion, the era of crowds, as opposed to the era of the individual. He is careful to insist, however, that when he talks of crowds he does not mean any casual collection of human beings brought together by chance, but what he calls a "psychological" crowd—*i. e.*, a crowd in which "the sentiments and ideas of all the persons in the gathering take one and the same direction, and their conscious personality vanishes"; in which "a collective mind" is formed; a crowd which "forms a single being, and is subjected to the law of the mental unity of crowds."

To produce such a crowd, "the simultaneous presence of a number of individuals on one spot" is not necessary. An entire nation may become a psychological crowd under certain circumstances, while hundreds of men gathered together by accident may not constitute a psychological crowd at all. Besides this, a crowd may be composed of dissimilar elements —men, women, children, lawyers, Unitarians, and chiropodists—in which case it is a "heterogeneous" crowd. An instance of a homogeneous crowd would be a sect, a caste, or a class. This book deals with heterogeneous crowds. However composed, there is no crowd in the author's signification of the term until there is a "provisional being," possessed of a sort of "collective mind" which "makes those who compose it feel, think, and act in a manner quite different from that in which each individual of them would feel, think, and act were he in a state of isolation"—just as in chemistry certain elements, when brought into contact with one another, "combine to form a new body possessing properties quite different from those of the bodies that have served to form it."

Into the causes which, according to the author, produce these curious results we have no space to go in detail, but M. Le Bon mentions hypnotism and suggestion as among them, his idea being that, by some process, the individual in a crowd is impelled in a given direction to do certain acts which as an individual he would never do. Mobs composed of respectable men lynch and hang without impartial trial and without sifting evidence; juries bring in verdicts which each individual juryman disapproves; a legislative body will pass a measure to which each member of it is, as a whole, opposed.

Such is the theory; it is followed by a description of the characteristics of crowds, with historical illustrations of the behavior of crowds, much of which is good. When, however, we come to ask (and this is, after all, the test question in matters of this kind), How will a crowd act under given circumstances? we find that the author can tell us nothing more than that it will act in an irrational, irresponsible, and emotional manner. It may act under the influence of a lofty emotion, as did the crowds which followed Peter the Hermit; it may act under the influence of very different passions, as did the Septembriseurs; but what any given crowd will do, no man can tell.

Now, all this we knew before we ever heard of hypnotism, or suggestion, or the law of mental unity, and we are obliged to declare our opinion that M. Le Bon's book is partly a description, in terms of his own, of traits of crowds known to every reader of history, and partly pure fancy. It will be noticed that we give him the full benefit of any doubt that may be suggested by his own system. We admit—though we do not pretend to know how it can be—that a crowd may be an aggregation of individuals not gathered together in any one spot, and that a "psychological" crowd is such an aggregation manifesting the traits which are required to bring it within the limits of the term employed. But, with this concession made, we must insist that his fundamental postulate that a crowd is an organism, governed by laws of its own, independent of the individuals who compose it, is a pure figure of speech. It often *seems* as if a mob were a sentient being following a law of mental unity, but the real reason why a crowd acts so differently from the way in which the individuals composing it would act is capable of explanation without any symbolism of this kind whatever. That reason is that each individual in it who is pursuing some common object, feels as if freed for the time being from responsibility for his acts, and is conscious of power greatly increased.

Very few people who have not devoted a good deal of attention to the subject have any idea how the whole tenor of their life and conduct depends on the constant sense of responsibility, either to opinion or to law, or to both, or what savages and animals they may become if this is withdrawn. Occasionally it is withdrawn from a number of people gathered together for some common purpose, and then in a moment the common purpose is carried out as if by wild beasts, or lunatics, or enthusiasts, without regard to consequences. If the purpose is interrupted by the police or by troops, it is abandoned with the same sense of irresponsibility that it is undertaken, and the individuals who compose the crowd run off as fast as their legs will carry them. Why? Because numbers produce a sense of irresponsible power which lasts only as long as the sense of power lasts.

Almost every trait or characteristic of crowds and mobs can be matched by instances of the same traits displayed by individual tyrants, freed from responsibility and animated by strong emotions. Why is it that dictators and despots have been notorious throughout history for murder, rape, robbery, fire, and slaughter? Simply because they have not been accountable for their acts. Why is it that the constitutional executives of our day are generally just in their dealings with the rights of subjects and citizens? Simply because they are answerable for their acts. In other words, a single person, suddenly feeling the sense of irresponsible power, shows just the same traits that we see in mobs.

We prefer our explanation of the matter to M. Le Bon's because it is simple and adequate, and saves all hypothesis, and accords with what we know of the nature of man. The other is mysterious, and, consequently, although expressed in terms of science, only pseudo-scientific. One additional proof of this is, that the author's speculations lead to nothing. We have searched his book in vain for any conclusion outside of mere description of phenomena. If it were really true that the law of mental unity actually compelled a jury to render a wrong verdict, surely jury trial ought at once to be abandoned. But it does not, because juries are not wholly free from responsibility. The author seems to be in favor of all existing institutions because, though all collective action is the action of a psychological crowd of some kind, the action of some other psychological crowd (like a caste, or a sect, or a bench of magistrates) might be worse. But this is all speculation, unless we have some principle to guide us, and the only principle laid down—that of the entity of the crowd separate and apart from that of the individuals who compose it—can lead to nothing, for it is a metaphor.

We have examined the author's theory at some length because it belongs to a large and constantly increasing class of speculations on human society which mislead the public into believing that they represent "science." What is called "sociology" is made up almost altogether of such speculations, often the work, as in this case, of men of unusual but misdirected ability.

Aspects of Fiction, and Other Ventures in Criticism. By Brander Matthews. Harper & Bros. 1896.

Mr. Matthews's volume justifies the risk that attends collective publication of short papers written, some for a special audience, and all with that keen relish for professional topics which is common to men who love the work they live by. The range is wide, from the Greek drama to the fiction of Mr. Kipling, and the whole is better than any of the parts. It is unfortunate that the very first essay, "American Literature," urges two points with a fervor which it is hard to share. For the sake of truth it is certainly well that American literature shall not be spoken of as an indigenous plant without ancestry or living relations. The phrase "American branch of English literature" has no defect except clumsiness; but the proposal to call everything written in Great Britain during the last century *British literature* implies a too finical devotion to accuracy and a profane disregard for tradition. The inhabitants of the British Islands, however, "have the pull," and, since for several centuries they have agreed to call their literature English, they will doubtless continue to do so as long as there is a man left to read or write.

Going behind literature to language, we are led to infer that the British have set up a claim to exclusive ownership of English, have intimated, with their usual arrogance, that the language has only been lent to America, and may even have threatened to take it back at their pleasure and leave Americans to struggle with Choctaw or any other gibberish they can lay their tongues to. Mr. Matthews disputes this preposterous claim, displaying an agitation which it is extremely difficult to understand. If the British made us a loan of the language so much prized by them, why, observing our disrespectful treatment of it, have they not taken it back long ago? If they mean to take it away, is their dilatoriness explained by a wish to appropriate thoroughly our extensions and improvements before shutting down on us? If there is no danger at all, why does Mr. Matthews alarm us by proclaiming joint ownership as vehemently as if demanding international recognition? Is there any security in the reflection that if the British let us have it

a little longer, when they come to demand it they will never be able to prove the loan? Here they may fall on a root, there on an analogy, but they can never get their pound of flesh in a lump, so they will go away defeated and angry, with no recourse but declamation setting forth the infernal ingenuity of Americans in the matter of repudiating debt.

In this discussion of the ownership of language is not the author a little lacking in that sense of humor which he defines so clearly in his pleasant paper on "The Penalty of Humor"? And had the sense quite abandoned him when he endorsed Mark Twain's silly diatribe against Sir Walter Scott? The wickedness of Sir Walter as discovered and exposed by Mr. Howells and Mark Twain makes one of the most horrifying revelations of our time. Mr. Howells spoke of him as a corrupter of youth (Republican, American youth), and Mark Twain said he had done "measureless harm," and that he was responsible for the duels, the rhetoric, and the comprehensive humbug of the South before the war. It is astonishing that Mr. Matthews should wish to belittle his theory about the reasons for the worthlessness of ante bellum literature by quoting such nonsense at length. If he shares the convictions and feelings of his distinguished compatriots, how can he with conscience cherish a tenderness for Mr. Stevenson and tolerate Mr. Lang? Granting to Mr. Stevenson the advantage insisted on that "he was also a master of the craft [story-telling], a loving, devoted, untiring student of the art, which Scott was not," Mr. Matthews cannot consistently urge such acquired grace as more than compensation for a natural predisposition and an unquenchable desire to imitate Scott's corrupt practices—not unless he should declare boldly that the harm as well as the charm of a story lies in the way it is told, and that Sir Walter's wickedness is all in his imperfect, discursive, haphazard method.

This question of method runs through all the essays, which are therefore full of instruction for the craft. Though Mr. Matthews is an ardent advocate of latter-day fiction, what he calls the "Inevitable," he refrains from scolding writers and readers of the other sorts. His belief in the superior educational value of "inevitable" fiction is common among authors of that school, and must surely add immensely to their esteem and admiration for each other. To the masses, all their talk about education through fiction is as bewildering as if their clergymen were to insist on the amusing and mirth-inspiring quality of sermons, and to commend their perusal for purposes of distraction. Indeed, the only public that takes the Inevitables quite at their own estimate, is made up of groups of ladies whom nature has not attuned to lightness and whom circumstances have rendered inimical to frivolity.

Mountaineering and Exploration in the Japanese Alps. By the Rev. Walter Weston, Member of the Asiatic Society of Japan; Member of the Geographical Society of Tokyo, Japan; Late British Chaplain, Kobe, Japan. With maps and 35 illustrations. London: John Murray; New York: Charles Scribner's Sons. 1896.

SINCE the recent and rapid rise of Japan to prominence it has been possible to sell a book about that country on the strength of its author having once lunched at Yokohama. Yet few of the volumes with which the publishing markets of London and New York have been congested touch more than the fringe of the principal island. Hardly one western reader in a hundred is familiar with the fact that Japan has its mountaineering associations, numbering in the case of the Tomoe kō several thousand members. The important political centres lie on the seaboard, and the casual bookmaker considers that his duty is done when he disposes of them. The hill country of the interior will hardly become a hackneyed subject these ten years.

Mr. Weston is the first member of the Alpine Club to write an extensive book of adventure in the higher mountains of Japan. An occasional tourist finds his way to the top of Asama-yama, and Mr. William Gowland has traversed the Hida-Shinshū range; but Mr. Weston has the field to himself when he essays to write from the standpoint of Ball, Whymper, and Conway. Not a single predecessor has dated his preface at the Eggishorn. Like all explorers who nowadays go far afield, he makes notes on botany, geology, and archæology. Like his congeners, also, he uses the Swiss Alps as a touchstone:

"And so we bade our farewell to the Alps of Japan. They do not, it is true, display the glories of glacier-shrouded peaks, and the scale on which they are built is only two-thirds that of the famous Alps of Switzerland. But the picturesqueness of their valleys, and the magnificence of the dark and silent forests that clothe their massive flanks, surpass anything I have met with in European Alpine wanderings."

A great deal is implied by the statement that one can dispense altogether with ice axe and rope in the ascent of Japanese mountains. Even the sharpest of them, Yarigatake, "the spear-peak," is an alpenstock summit. Facility of conquest is sure to breed contempt among the climbing fraternity, and we doubt whether many of the élite will be tempted by Mr. Weston's descriptions to visit Japan for the express purpose of breaking new ground. It is not altitude alone that counts. Fuji-San stands up well with Sifton and Cook in the southern island of New Zealand, and is actually higher than Mount Assiniboine in the Canadian Rockies. It is comparatively unattractive to the climber from being a mere volcanic cone without foothills. Mr. Whymper found mountains of a similar type in the Andes unprofitable, although they overtop the Caucasus. At any rate Fuji stands alone in point of altitude. A difference of 2,000 feet separates it from its nearest rivals. Mr. Weston climbed the "matchless mountain," but the most entertaining part of his narrative is that which deals with the central range from Ō Renge-San to Ontake. In the summer of 1894 he traversed it from north to south.

In this central range, which seldom soars above 10,000 feet, Yarigatake is to be singled out for its physical features and Ontake for its religious associations. The former peak is somewhat more than the Dent de Jaman and considerably less than the Matterhorn. It rises almost straight from the plain of Matsumoto, and every foot of its stature counts. Mr. Weston tried it without success in 1892, foiled partly by his ambition to ascend from a difficult side and partly by the weather. The next year he tried again and triumphed. The top of Yarigatake, formidable at a distance, seems to have afforded no special difficulty. "The smooth steep slabs, dangerous enough in wet weather, were now perfectly dry, and convenient cracks and ledges gave good hand and foothold everywhere. . . . The actual summit is a narrow platform a few yards long, dropping on the east and west in perpendicular cliffs, and affording a prospect grand and impressive in the extreme." While Yarigatake is climbed only at rare intervals and by persons of adventurous spirit, a shrine on the summit of Ontake is annually frequented by hundreds of white-robed pilgrims who seek by the ascent to obtain purification of the spirit. They are often grouped into societies of a quasi-religious and and a quasi-social character. The members pay an initiation fee and regular dues. When the season for pilgrimage arrives, lots are drawn, and those whom chance designates go at the cost of the society. Volunteer members may go too, but at their own expense. Ontake is a volcano, long dormant, though now and then able to show signs of potential activity. Mr. Weston ascended it from the Fukushima side in August, the month of most general pilgrimage, and furnishes a graphic account of what the pilgrims wore, said, and did. Valuable photographs of a whole company and of the shrine at the summit are reproduced in full-page illustrations. We very much wish that Mr. Weston could have secured a photograph of the *nakaza* whose hypnotic trance he describes.

Although a good many professional hunters are to be found in the Japanese Alps, the local guide is seldom efficient. Mr. Weston tried Kasadake three times before he could overcome the peasants' objection to aid him. In the end he found a hunter of big game, Nakashima, who not only consented to go along, but helped him to elude the villagers of Onsen when they threatened to interfere with the plan. Nakashima explained the reluctance of his countrymen by unfolding their belief in a mountain genius who sends down storms upon the valley if a stranger penetrates his sanctuary. He himself, though not sharing the superstition, revered the mountain deity, lighted candles to him during the ascent, and offered supplication with folded hands.

We should give a false impression of Mr. Weston's 'Mountaineering and Exploration' if we dwelt upon the first branch of the title, to the complete exclusion of the second. The author, besides climbing, went through many remote districts on his way to the peaks, and discourses about the country folk at great length. We are unable to present any portion of the information which he has collected, but we can sincerely say that it is fresh in quality and well arranged. The book as a whole is less exciting than many recent contributions to the library of sport and geographical research, but it will bring fresh credit to the zeal and energy of the Alpine Club.

The Literature of Music. By James E. Matthew. A. C. Armstrong & Son.

IF Mr. Matthew (who is also the author of a 'Manual of Musical History') had called his new work 'My Musical Library,' his title would have been more modest and less misleading than the one he chose. He says in his preface that as long ago as 1839 C. F. Becker wrote a musical bibliography comprising upwards of 6,500 titles, and that probably the most important and best known musical library is that formed by Fétis, containing about 4,200 titles, and now the property of the Belgian nation. Mr. Matthew's collection, he tells us, slightly exceeds that. It is no doubt a most interesting collection, judging from his description of it, but in some of its departments it is ludicrously incomplete. Thus, in the chapter on 'Dictionaries of Music,' no

mention is made of Riemann's 'Musik-Lexicon,' by far the best and most reliable work of its kind in existence; indeed, this prolific and admirable German writer is represented only by his 'Opern-Lexicon.' Quite as strange is the fact that much the most widely read of contemporary German writers on music, who has written historical, æsthetic, and critical works, some of which have passed through a dozen editions—Dr. Hanslick—is not even mentioned in the index. Absolutely inexcusable is the omission of all reference to Liszt's important writings, only one of the six volumes (the 'Chopin') being referred to. Nay, *horribile dictu*, the literary works of Schumann, Weber, Wagner, and Berlioz—the most valuable books on music in existence—are not mentioned! Under such circumstances it is not to be wondered at that although the author seems to have been informed by a kind friend (perhaps the proof-reader) that "the Wagner literature alone forms a large library," his own list includes only nine articles in it. Mr. Matthew's library apparently ceased growing fifteen years ago; but, such being the case, he should not, as already suggested, have called his book 'The Literature of Music.'

A student who wants to know the titles of the most important books on musical subjects will find the 104-page 'Musical Literature List,' published by the Scribners, much more up to date and useful. It is to the antiquarian and curiosity-hunter that Mr. Matthew's book appeals chiefly; and such will find it an interesting guide. The scope of the book is indicated by the heads of the twelve chapters, which are as follows: The Literature of Ancient Music; The Mediæval Writers on Music; Early Works on Music after the Invention of Printing; Musical Literature in the Seventeenth Century; Musical Literature of the Eighteenth Century; Histories of Music; Biography; Dictionaries of Music; Literature of Sacred Music; Literature of the Opera; Literature of Musical Instruments; Literature of Music as a Science; Bibliography of Music.

A Dictionary of Chemical Solubilities. By Arthur Messinger Comey. Macmillan. 1896.

THIS is one of those useful compilations of data whose making represents an enormous amount of painstaking labor. It is the lineal successor of Prof. Storer's 'First Outlines of a Dictionary of Solubilities of Chemical Substances,' which appeared in 1864, in a limited edition, and has never been revised or reprinted. Since then, the growth of chemical science has been so great that when Dr. Comey undertook the present work, a mere revision of Prof. Storer's book was out of the question, and it was necessary to start afresh. This Dr. Comey has done, and in 515 pages presents the collected data in regard to "all analyzed inorganic substances," including the oxides and sulphide of carbon, the carbonates and the simple and complex cyanides. We trust that we are right in the inference that a second volume dealing with the solubilities of organic substances may be looked for from the same source.

In its application in this work, "solubility" is given its largest and loosest meaning, and chemical reactions which yield solutions of one or more of the resulting products are included along with cases of simple "physical" solubility. Thus, the solubility of iron and other metals in acids is given in detail. This broad use of the term, however, does not justify the 'Chemical Solubilities' of the title, which is certainly misleading, and we see no reason for its substitution for the 'Solubilities of Chemical Substances,' which Prof. Storer employed.

The material is arranged alphabetically, and the difficulties which might arise from such arrangement in the present somewhat confused state of chemical nomenclature have been lightened, as far as possible, by abundant cross-references. The solubility of each substance in water is first given, then the specific gravity of aqueous solutions, when such data exist, and their boiling-points; following this is the solubility in inorganic acids, in alkali and salt solutions, and finally in organic substances. It is manifestly impracticable for the compiler of such a work to attempt to verify experimentally the statements of different observers, or to decide between contradictory data in most instances; so all data with any claim to reliability have been given, with references to the original sources so far as possible. The work has been carried out with the care and minute attention essential to success in dealing with such an enormous mass of detail, and appears to be commendably free from errors and omissions.

BOOKS OF THE WEEK.

Ames, Prof. J. S. Theory of Physics. Harpers. $1.60.
Baskervill, W. M. Southern Writers. Sidney Lanier. Nashville, Tenn.: Barbee & Smith. 30c.
Beauty and Hygiene. Harpers. 75c.
Benton, Emily E. The Happy Method in Numbers for Little People. Syracuse: C. W. Bardeen.
Boisgobey, Fortuné. Fontenay the Swordsman. Rand, McNally & Co.
Brodhead, Eva W. Bound in Shallows. Harpers. $1.25.
Conner, P. S. P. The Home Squadron under Commodore Conner in the War with Mexico. Philadelphia: The Author.
Cust, Lionel. Albert Dürer's Paintings and Drawings. [Portfolio Monographs.] London: Seeley & Co.; New York: Macmillan.
Daniell, M. G. New Latin Composition. Leach, Shewell & Sanborn. $1.
Educational Review. Vol. XII. June-December, 1896. Henry Holt & Co.
Gordon, Rev. G. A. Immortality and the New Theodicy. Boston: Houghton, Mifflin & Co. $1.
Harrington, Prof. K. P., and Tolman, Prof. H. C. Greek and Roman Mythology. Leach, Shewell & Sanborn. $1.
Hazard, Dr. M. C. Marriage Chimes for True Lovers. Boston: Pilgrim Press. 75c.
James, Henry. The Spoils of Poynton. Boston: Houghton, Mifflin & Co. $1.50.
Keightley, S. R. The Last Recruit of Clare's. Harpers. $1.50.
Knoke, Prof. F. Das Varuslager im Habichtswalde. Berlin: R. Gaertner; New York: Lemcke & Buechner.
Lang, Andrew. Pickle the Spy; or, The Incognito of Prince Charles. Longmans, Green & Co. $5.
Mason, Dr. R. O. Telepathy and the Subliminal Self. Henry Holt & Co. $1.50.
Pollok, Col. Fifty Years' Reminiscences of India. Edward Arnold.
Rabb, Kate M. National Epics. Chicago: A. C. McClurg & Co. $1.50.
Rhoscomyl, Owen. For the White Rose of Arno. Longmans, Green & Co $1.25.
Romanes, G. J. Essays. Longmans, Green & Co. $1.75.
Saint-Amand, Imbert de. Louis-Napoléon et Mademoiselle de Montijo. Paris: Dentu; New York: Meyer Bros. & Co.
See, T. J. J. Researches on the Evolution of the Stellar Systems. Vol. I. Lynn, Mass.: The Nichols Press.
Stuart, Esmé. Arrested: A Novel. Appletons. $1.
The Evergreen: A Northern Seasonal. The Book of Winter. Edinburgh: Patrick Geddes; Philadelphia: J. B. Lippincott Co.
Thompson, N. G., and Cannan, F. L. Hand in Hand Figure Skating. Longmans, Green & Co. $1.50.
Thoroddsen, Th. Geschichte der Isländischen Geographie. Leipzig: B. G. Teubner.

"*The New Edition is a great improvement over even the old one.*"—Prof. Tyler of Amherst.

BESSEY'S BOTANY

Briefer Course.

Entirely New Edition (1896). *With abundant Practical Studies for the laboratory.*

356 pp., 12mo, $1.12 *net.*

Prof. J. M. Rothrock of University of Pa., on the old edition: "There is nothing superficial in it, nothing needless introduced, nothing essential left out. The language is lucid."

The Botanical Gazette on the new edition:

"It is with great pleasure that we welcome this new edition of his very useful 'Essentials.' . . . As the book has been and must continue to be one of the most largely-used texts, it is to the interest of botany for it to present current views. The most notable change is to be found in the new chapter on plant physiology, a subject which has been made a science since the old text was written. Protoplasm and cell structures are also freshly presented in the light of new knowledge. . . . An effective recasting of a long-tried and very useful text."

Prof. JOHN M. TYLER *of Amherst also says:*

"I have used the old one for several years now as the best text book which I could find to give a class of beginners a good introduction to cryptogamic botany, during the brief time which we could allow for that purpose. The plan of the book is excellent, and it is exceedingly well executed."

The Nation.

NEW YORK, THURSDAY, FEBRUARY 25, 1897.

The Week.

PRESIDENT CLEVELAND keeps up what pettish Senator Hoar calls "the modern method of finding fault" with private pension bills. They used to slip through without question, but when you have an Executive who actually examines them, reports them to be often scandalous, and usually based on no rule or reason, and shows that they set a bad precedent, certain to lead to more and more overriding of the general pension laws and emptying of the Treasury, it makes no end of trouble for Senators. Surely, as Senator Gallinger observed, it is "trivial and foolish" to compel the Senate to pass over a Presidential veto bills which should never have been passed at all. For our part, we hope Mr. Cleveland will keep on vetoing every profligate bill that Congress sends him up to the last hour of his term. He at least lays down a principle, and shows up the emptiness of the congressional pretence of desiring to be economical. We suspect one ground of senatorial rage at his vetoes is that they are a practical attempt to enforce economy. Senators say of this, as the French Minister for Foreign Affairs jestingly wrote to the French Minister to England, when the latter reported a saving in the expenses of the London legation, "It is a bad precedent—it is an economy."

The news seems to be pretty well authenticated that Gen. John J. McCook, of the law firm of Alexander & Green, has been designated by Mr. McKinley for the position of Attorney-General. If this be true, the President-elect could hardly have made a better selection. It is an added commendation that he has made this choice, not as a political makeweight, not to please Platt or to displease him, but solely because he has personal knowledge of Mr. McCook's high qualifications for the position. Such an appointment, like that of Mr. Gage to the Treasury, will bring strength to the cabinet, not only in its personnel, but still more in the confidence of the public.

The great opportunity of President McKinley in the cause of an improved public service is to redeem a number of offices, of the highest importance, which probably never could be brought under the classified system, and yet have no more connection with politics than the superintendency of the Coast Survey. Why not once and for all stop the nonsense of turning out the heads of great departments? Why should the Commissioner of Patents and his assistants be changed when the White House changes its politics? Why should the determination of the comparative claims of Bell, Drawbaugh, Gray, Edison, and Berliner to the creation of the telephone be any different next year from what it was last year? Why should the Assistant Treasurer and collectors of internal revenue be changed? What is there about the routine of their office which requires the incumbents to be "in sympathy with the Administration"? The enormous responsibility of an Assistant Treasurer requires him to be a man of the utmost coolness and evenness of temper. More than one admirable Treasurer has resigned from sheer anxiety. Is it likely to conduce to this tranquillity of mind that, as soon as the 4th of March comes, begins the uncertainty of how long he shall be kept in, depending wholly on the pull which the rival candidates have against each other? If Mr. McKinley, who has given such an unexpected mark of superiority to ordinary partisan theories by selecting Mr. Gage for the Treasury, will allow him to keep such of his force as he knows, and every one knows, are doing their work perfectly well, without caring how many hungry Republicans are after their places, he will add a leaf to his civil crown which very few of his predecessors can rival in brilliancy.

The action of the Senate on Thursday in confirming two nominations of Democrats for United States district judgeships, in Nebraska and North Dakota, is to be heartily commended. It was but a fortnight to the 4th of March, and as there was opposition to the confirmation of gold-standard men by silver Democrats, the Republicans could easily have carried both cases over, and so left the vacancies to be filled by McKinley with Republicans. It is an unexpected exhibition of good sense that the nominations of worthy men should have been confirmed under these circumstances, despite the fact that they are Democrats and will assume life offices which might have been captured for Republicans. If the question was regarded purely from the partisan standpoint, however, it was no less shrewd a course that the Republicans took. They needed the votes of gold-standard Democrats last fall, and may want them no less badly again in the future. Slaps in the face would not be the best way of securing a continuance of harmonious relations.

The announcement made by Gov. Bushnell that he intends to appoint Mr. Mark Hanna as Senator from Ohio when Senator Sherman resigns, is not unexpected. The backing and filling which has been noticed in that quarter for some weeks finds a rational explanation if we suppose that the Foraker machine which controls Ohio wanted to know exactly what it would get for letting Mr. Hanna have the office. It may be that Foraker himself would have refused on any terms to take Hanna for a colleague, but it is hard to dispute with the master of twenty legions. Undoubtedly the President-elect could take Foraker's henchmen away from him if necessary. Any augur inspecting the entrails at Cincinnati during the last two or three weeks could have told that there was a struggle going on between federal patronage and the State machine, and could have predicted that Cox, the local boss, would "line up" with the former eventually. The appointment of Hanna is certainly better for Ohio and for the country than that of a henchman of Foraker would be. As Mr. Hanna has never held any public position before, it is too early to make any forecast of his qualities as a Senator. Usually the man who is pitchforked into so high a place without preparation, or demonstrated capacity to fill it, disappoints his friends more than his enemies; but on the other hand we have so many examples of men who climbed up slowly and then turned out badly, that it is impossible to lay down any general rules. In the company of such old stagers as Chandler, Lodge, Quay, Platt, Gorman, and Morgan we think it most likely that Hanna will shine by comparison.

A senatorial deadlock which had lasted a full month was ended in South Dakota on Thursday by the reëlection of Senator Kyle. Mr. Kyle was sent to Washington at the same time with Peffer of Kansas, six years ago, as the result of a political revolution which lost the Republicans one of the new States which they had just admitted in order to strengthen their power in the Senate. Even if such a revolution continue, it is pretty certain to develop new leaders, as Peffer found when he sought another term. Kyle is exceptionally fortunate in getting his reelection, which, indeed, he owes rather to the Republicans than to the Populists, since most of his own party refused to support him. He has been as harmless as a Populist Senator can be expected to be. The other Senator from South Dakota, Pettigrew, who was reëlected by the Republicans two years ago, turned Populist last summer, and supported Bryan in the Presidential campaign. Both of the Senators from this new State are now, therefore, Populists, with terms running four and six years. Of the other new States, Idaho and Washington have this winter elected Populist Senators; and Utah has chosen a Democrat who accepts the Populist financial

platform. One of North Dakota's Senators for the past four years has been a Democrat, whose term has two years yet to run. Here are six opposition Senators out of fourteen from those seven States. In addition, there are some among the remaining eight, like Cannon of Utah and Carter of Montana, who are entirely out of sympathy with the Republican position regarding the silver question, and whose attitude towards the party policy in the next Congress is uncertain. Never was an attempt to strengthen a political organization by unjustifiable means so completely defeated by the course of events as the Republican policy of securing permanent control of the Senate by admitting a lot of new States a few years ago.

Senator Wolcott has returned to London from his swing around the circle, and says that he has good reason to believe that his mission will have some of the good results hoped for. One of the results hoped for is the reëlection of Senator Wolcott—when the time comes; and to this result we are easily resigned. Mr. Wolcott made his mark as the only Senator who dared to proclaim the truth when the Venezuelan excitement was blazing in Washington city one year ago. He set a noble example. He rendered a great service. He really recalled the best examples of the past when the Senate was the country's greatest power and pride. Not less, but perhaps even more notably, did Mr. Wolcott vindicate his manhood when he refused to follow his colleague Teller in the support of Bryan last year. He took his political life in his hands then, and it would be a pity if he were to lose it. But, although our sympathies go out to Mr. Wolcott as a Senator and a man, they do not follow him as a hunter after international conferences. We think that he will fail, or rather that he has already failed, in that aim. We feel very sure that the saying of the *North German Gazette* will prove true, that the interview accorded to him by Prince Hohenlohe was purely one of courtesy, and did not partake of an official character, and that the same is true of his visits to London and Paris. The governments of the Old World do not comprehend the kind of diplomacy that takes place outside of diplomatic circles. Moreover, they have had a good deal of experience of this back-door bimetallic solicitation on our part and of the consequences thereof. They have acquired the art of shifting upon each other the onus of declining. What France, for instance, means when she says that she cannot go into bimetallism unless Germany and England do likewise, is that she hopes that Germany and England will do nothing of the kind. She knows, too, that she does not run much risk.

After long and somewhat mysterious sticking in the committee on coinage, the bill for an international bimetallic conference was reported to the House on Monday. An amendment has been tacked on giving the President the option of proceeding by way of diplomatic negotiations, instead of a conference, if he thinks he can more easily debase our currency by that method. This doubles the humbug without decreasing the danger of the bill. We suppose it will pass the House, though evidently not without debate and the telling of unpalatable truth by some Republicans. But the long delay of the bill has given President Cleveland a chance, which we sincerely trust he will improve, to kill it by a pocket veto. It is even hinted that Speaker Reed has nursed the measure along for the express purpose of getting it finally crushed in that way. However that may be, we hope to see the President's refusal to sign the bill. He may, of course, argue that it is a matter solely affecting his successor, and that courtesy to him would suggest letting the bill become a law. But we think a higher view, both of propriety and duty, would lead him to have neither part nor lot in such a tricky and dangerous measure, and to make his record for opposing all forms of unsound currency complete and consistent down to the very end of his term. Let Mr. McKinley pull his own bimetallic chestnuts out of the fire.

The bill "to increase the efficiency of the foreign service of the United States and to provide for the reorganization of the consular service," which the Foreign Affairs Committee of the House agreed last week to report favorably, is not, of course, expected to become a law this session. It will be, however, a basis for legislation in the next Congress, and really marks of itself a great opening of the congressional mind to the facts which reformers and business men have long been proclaiming. It is a little late, but it is none the less welcome, to have a congressional committee declare:

> "Our consuls should be trained for their positions and pass an examination on such subjects as the laws regulating shipping, the commercial treaties existing between their own and other countries, the laws relating to intestates, on the consular regulations of the United States, and on such other subjects as relate to their duties. They should also be required to have a practical knowledge of French or of the language of the country to which they are to be sent."

The report also dwells, in what would once have been thought the most fawning way, upon the experience of Great Britain, and even ventures to ask and answer the deadly question, "Where will such a specially educated class come from?" From the young men of the country, it replies, now crowding the professions and ready and eager to enter upon a diplomatic career, if it were only to be made a career where intelligence and fidelity would be rewarded as in other callings. Into the details of the bill, with its provisions for boards of examiners and classification of consuls, it is not necessary now to enter. As it stands, it is a most reassuring sign of the times and of the steady progress in rescuing the public service from the spoilsmen which we are making.

The present House of Representatives, after voting $15,000,000 for rivers and harbors and public buildings, seems disposed to economize on battle-ships. We see no objection to this, although we see very much to the appropriation in question. It is certain that the line must be drawn somewhere if the McKinley Administration is to be saved from wreck on the financial side, and it had better be drawn at warlike rather than at peaceful expenditures. "In time of peace prepare for war," is an adage better suited to a past age than to the present, and to other parts of the world than to this. Most likely our half-civilized Senate, that refuses or neglects to ratify the treaty of arbitration that has been negotiated at its own instance after great trouble and difficulty, will pile on a battle-ship amendment when the bill reaches that body. If so, we hope that the House will stand firm or that the President will kill the bill. The present session has now reached the stage where he can put any bill to death by doing nothing to it. The sundry civil bill, with its monstrous appropriation of $50,000,000, is in that category.

Our old friends of the American Screw Company had their annual meeting at Providence a few days ago. The report of the President and Board of Directors contains some wholesome views on the subject of the tariff. It says:

> "We have gotten beyond the necessity for a high tariff; pools have proven to be of no permanent advantage to us; we have to adapt ourselves to new methods of manufacture and new conditions requiring adjustment which only time can accomplish, but are hopeful that with reviving confidence in general business and a larger demand for our product—the greater because of enforced economies of late—by this time next year we may inform you of a more prosperous business and a larger employment of our plant than for many years past, and at moderately remunerative rates."

In other words, the tariff has exhausted itself so far as this industry is concerned. It has exhausted itself as to steel rails, steel billets, pig iron, and many other things on which high duties are still retained which have no *raison d'être*. Some of the tariff organs, a little flustered, are telling us that this condition has been brought about by protection itself. We have no wish to discuss an abstraction, nor to deprive them of a belief which gives them comfort. If they will simply join in repealing duties which they concede to be no longer needed, we shall not seek to deprive them of a pious opinion.

The *American Manufacturer* of Pittsburgh has a very striking letter from England on the subject of the introduction into British markets of American steel billets and bars on a scale of com-

mercial magnitude. The amounts imported or contracted for are said to reach 22,000 tons. At first this news was received with incredulity, for although the importation of American pig iron has been going on for some time, it was not believed possible that American steel could be laid down in England in competition with their own producers. The fact which they have to face, however, is that steel bars from the Carnegie works are regularly imported into Staffordshire for sheet-iron mills, and into Lancashire for wire works, at 5s. to 7s. 6d. per ton *less* than the actual selling price of British billets. The opinion of British makers is that the present conditions are exceptional and due to the depressed condition of trade in the United States. The belief is expressed that when trade revives there will be a rise of prices in this country which will prevent the continuance of the export movement. The answer is that there is no obstacle to the increase of production in this country to meet any demand, domestic or foreign. That is, the raw materials exist here in the greatest abundance, and there is no limit to the multiplication of machinery. Hence if the home demand should overtake the supply it would be only for a short time. The United States has entered on a new career as a manufacturing country, and, so far as steel is concerned, the conviction is slowly forcing itself on both British and Continental opinion that we have not only the best supplies of raw material, but also better apparatus for working it than exists anywhere else in the world.

One of the most open efforts which have been made thus far to destroy the secrecy of the new ballot system appears in a proposition which is before the New Hampshire Legislature. This is, that, in towns and wards casting 250 votes or more, the election officers be permitted to begin sorting and counting the vote before the polls close, "so as to make an early declaration possible." This would enable the party managers to ascertain the state of the poll at any time, and thus lay plans to change the result if possible. It would enable them to drum up recruits, buy votes, or do anything else within their power to save the day if they saw that the election was going against them. Corrupt voters would hold back till the last hour in order to dispose of their goods under the most favorable conditions, and a state of affairs would be created which would make the ballot a farce. It is fitting that this proposition should be accompanied by another, doubling the number of names now required to make a nomination by petition. Both are assaults upon the Australian system as an aid to good government through honest elections, and if the people of New Hampshire allow them to become law they will find themselves put back where they were before the new system was established.

Gov. Black's hope of taking the starch out of our civil-service law received its quietus in the decision of the Second Appellate Division of the Supreme Court on Friday, sustaining unanimously the previous decision of Justice Keogh as to the self-executing character of the civil-service-reform amendment to the Constitution. Summed up in a sentence, the decision is that the Constitution is supreme, and that it gives the courts power to review the action of the Governor, Legislature, mayors, heads of departments, and civil-service commissioners, and to compel them to comply with the constitutional mandate to make all appointments and promotions according to merit and fitness, ascertained, so far as practicable, by competitive examinations. The only question to be considered is as to the "practicability" of such examinations, and this is not to be decided by the officials, but by the courts, and they have decided, in all cases which have come before them, in favor of practicability. The courts, in fact, from the lowest to the highest, are now arrayed in solid ranks against Gov. Black and the Gruber-Van Allen Progressives, and the outlook for breaking down the "civil service" or in any way weakening the rigor of its administration is hopelessly dark. By appealing to the courts, the reformers can compel any official, whether the Legislature has included his department under the civil-service regulations or not, to select his subordinates only after competitive examinations. District-Attorney Olcott should think seriously on this subject and bow to the inevitable before he is forced to do so.

The protest which Mayor Strong and President Low have filed against the bipartisan Police Board, Municipal Assembly, and power-of-removal provisions of the new charter is a most welcome document. It will furnish a strong working basis for a full and rational discussion of the charter, and this we have not yet had. Their objections are precisely those which have been made many times in these columns, and in making them now Mr. Low puts himself again upon the impregnable ground which he occupied in his chapter in Mr. Bryce's 'American Commonwealth' and in his *Century Magazine* article. This city has at last secured official utterance as to its rights in the matter, and its voice must be heeded at Albany. If we must have a new charter at once, let us at least have it in the best form possible, and not in its present undeniably bad form, because, as Messrs. Strong and Low say, it has in three most important particulars been "constructed upon a wrong theory." There is ample time in which to amemd it and make it conform to the right theory, or to the teaching of a half century of experience.

The Hawaiians are getting ready, with the other people who want something desperately, to move on McKinley in Washington early in March. They are evidently a little nervous about the Republican cooling towards annexation. That passage in the 'Recollections' of the new Secretary of State in which he pledged himself to do "nothing to extend its [the United States] limits or to add new dangers by acquisition of foreign territory," has been the subject of much sad pondering in Honolulu. The only hope there is, that Sherman didn't really mean it, or that McKinley had not heard of this when he chose his head of the State Department. Another cause of annexation dejection is the result of a private canvass of the United States Senate. Letters were received by a Honolulu business man from "about thirty" Senators whose present views on annexation he had sought. Eleven of these either declined to commit themselves or were positively opposed to annexation. It is obvious that if that proportion holds, no treaty of annexation could pass the Senate. The real difficulty is, as the Hawaiians are finding out, that the furious desire of the Republicans to annex Hawaii three years ago was strictly for that time and against that President only. Now, we fear, there will be a disgusting disposition to consider any treaty of annexation on its merits.

The Powers acting in concert about Crete still hold the Greek wolf by the ears, and are bringing what pressure they can to bear on King George's Government to make it easy for them to let go. The King has issued a proclamation beseeching popular calm and self-restraint, with what prospect one may judge from our Athens letter, on another page, in which the Greek temperament is shown in quite a different connection. The wolf, meanwhile, has got its lodgment in Crete in the shape of Colonel Vassos and his regulars, and, as in Munchausen's fable, seems likely to eat its way into the Moslem carcass in spite of, or even because of, the blockade, which, if it keeps out reinforcements and supplies from the mainland, equally repels Turkish interference. What may happen on the Thessalian border before Greece is coerced into leaving the fate of Crete in the hands of the Powers, no one can tell. The "concert" is by no means perfect, and is liable to vary through every degree to discord in the event of certain contingencies. If the Eastern Question could be settled by gunboats alone, it would present little difficulty. But a general uprising in the Balkan Peninsula is not to be met by shutting up the Peiræus or bombarding insurgents from the port of Canea.

HAPPY-GO-LUCKY FINANCE.

The haphazard management of our national revenue and expenditure glares at one whichever way he may look in Washington. The President advised Congress to be economical, to give the Wilson bill a chance, and to fall back on the Treasury surplus to meet a temporary deficit. Congress vowed it was horrible to think of using for current expenses money got by bond-sales, but has gone ahead and voted such swollen appropriations that this very money will have to be used to pay them. As for the Wilson bill, that must be replaced as speedily as possible, for two reasons: first, it was flooding and ruining the country with foreign imports; second, it was not bringing in enough imports to furnish a decent revenue. The fact that these two reasons kill each other is only a motive for urging them both with added vehemence. Equal consistency and beautiful logic are revealed in the scheme of the new tariff bill. Rates are to be marked up so as to keep out imports, and are to be so high that the duties on imports will fairly flood the Treasury with money.

These illustrations of our happy-go-lucky methods in public finance might be indefinitely multiplied. The truth is, we have trusted to luck and have blundered cheerfully ahead for the past ten years. Secretary Fairchild was the last head of the Treasury able to estimate the national revenue without being ludicrously wide of the mark. His successor, Mr. Windom, complimented him on his accurate forecast, but since then the guessing has been wild. Senator Aldrich, the great tariff expert, was many millions out of the way in stating what the revenue from the McKinley bill would be. Yet he and Mr. Dingley will soon be telling the country to a dollar what amount of revenue the new McKinley bill will yield. Mr. McKinley brought in his bill with the distinct assertion that it was meant to raise prices, yet within two years he was presiding over a Republican national convention which solemnly declared that the effect of his bill had been to lower prices.

Is it any wonder that, with such men and such methods in control of our national finance, we have ceased to produce financiers in public life? Gen. Garfield was the last chairman of the ways and means committee whose speeches showed economic insight and knowledge, who had a firm grasp of the principles of taxation, and whose annual summing up of the nation's income and outgo possessed something of the skill and interest of Mr. Gladstone's speeches on the English budget. Since then we have gone riotously forward, presuming on our rude health to enable us to pull through every imprudence. For long years we seemed able to do so with ease. The surplus kept heaping up in spite of extravagance, with the result of encouraging us to fresh extravagance. But we at last found that even the vigorous American system could not endure a prolonged financial debauch. For four years we have been suffering the well-known "next-morning" symptoms. The patient reluctantly admits that he is ill and sends for the doctor.

But what treatment does Dr. Dingley prescribe? Why, from all accounts, another course of high living. No economy—no leaving off the liqueurs and *pousse-cafés* to which the pampered patient has been accustomed; he would be angry and might change physicians if that were suggested. The thing to be recommended is a going back to the full feeding of the McKinley bill. High duties and thumping revenues will make all well again. That, as nearly as we are able to gather, is the new Dingley-McKinley programme.

Now it must be pointed out that this old happy-go-lucky method of doing it is no longer possible. Conditions have so changed since 1883 and 1890 that tariff legislation which was reasonable in those years, considered from the point of view of revenue, will now be only ludicrous. The case was clearly stated by Secretary Carlisle in his last annual report. Mr. Carlisle is, every protectionist knows, a very bad man; but he happens to have a terribly lucid intellect, and a habit of leaving irrefragable statements behind him for his opponents to break their teeth on. Such a statement he made bearing upon the point in hand, and it is this:

> "Nor do I believe that, under existing industrial and trade conditions here and abroad, an increase of duties upon articles now dutiable, with the exception of a few which are not produced at all in this country and others which are not produced in sufficient quantities to supply the demands of our own people, would yield the Government much, if any, additional revenue. What has already been said concerning the ability of our manufacturers and others to command the home market, to the exclusion of foreign products similar to their own, shows that in the selection of imported articles for taxation for the purpose of raising revenue the Government is necessarily confined to comparatively narrow limits. The cost of production in all the great manufacturing nations has been so nearly equalized by modern inventions and economies that movements of their several products from one to another cannot take place upon a large scale, or for any considerable length of time, if these products are burdened in the markets to which they are sent with charges to which they are not subjected in the countries of their origin; and this tendency toward equalization of cost is still going on and must continue. A very small tax or charge will now entirely prevent the importation of many articles which a few years ago constituted a large proportion of our total dutiable merchandise and contributed very materially to our public revenues. . . . Some increase of revenue might be secured by imposing higher rates, but even this will prove to be an annually diminishing amount except in the cases of such articles as cannot on account of natural conditions be hereafter produced here."

Since Mr. Carlisle wrote this, events in the commercial world have strikingly confirmed it. Imports under the Wilson bill have not increased, despite the apparent imminence of higher duties. Always before, in such circumstances, imports have run up enormously. A perfect flood came in the last few months before the McKinley bill took effect. To guard against a similar thing now has been one of the great worries of Mr. Dingley. But if the trade returns keep on as they have been going, he need not trouble himself. There will be no deluge of importations. The reason is that in all the old protected lines of manufacture the American producer is more and more completely supplying the home market. Cost of production has been so reduced in one way and another that it is now the European manufacturer who is afraid of the American. It follows that the good old days of putting on a high duty both to protect and to bring in revenue are past. Mr. Dingley will have to make his election. He can have protection or he can have revenue; he cannot have both by the same measure. What he will really be driven to, it is almost certain, is some new form of taxation. Profligate Congresses can no longer be supported on a customs revenue. There will have to be new objects of taxation and sources of revenue, with the appropriations running steadily above a billion dollars. Mr. Dingley may try to get on by the old happy-go-lucky method, but he will surely find that it will be neither happy nor lucky, and that it will not go.

MR. FOWLER'S SPEECH.

Congressman Fowler's speech at the Massachusetts Reform Club's dinner is a valuable contribution to the political as well as the financial thought of the day. It is important most of all for its boldness. Mr. Fowler "takes the bull by the horns." There is no other way to take the bull, because his horns will be thrust through us if they are not stopped in some way. The situation is changed by the election of last year only as regards time. The victors in that contest have time to put the finances of the nation on a new footing. Unless they do so they will find in the next campaign the same kind of battle that they had in 1896. The issue will be free coinage at 16 to 1, which means the single silver standard. The Bryanites may trim their platform somewhat differently as regards the Supreme Court. They may make themselves a trifle less obnoxious on the score of anarchism, but on the question of depreciation of the standard of value, which is the main question, they will be not one whit better, but will be more confident than ever. The only chance of beating them is by changing the issue and bringing back business prosperity. It is possible to do this, but it requires the boldest and most decisive measures.

It is an irrefragable proposition that the present depression in trade and industry is due to want of confidence in the standard of value, for, as Mr. Fowler puts it, "the question is still open for debate whether the American dollar is really fifty or one hundred cents." This is a fact known to all men. Every member of Congress, of every shade of belief,

understands and feels it. Mr. Fowler proceeded as follows, and we quote his words, not because they contain anything novel, but because they are put before the public without varnish by a member of the committee of the House of Representatives having these things in charge:

"Have you ever thought of it? We are subjecting our national honor to a daily debate at every directors' table where a discussion is had about securities. In every broker's office, in every lawyer's rooms where loans are negotiated, in every home where investments are talked over, the possibility of a change in our standard of value lurks like a 'skeleton in the closet.'

"Across our minds in hot pursuit, following this frightful possibility of dishonor, sweep our demand obligations, now amounting to more than $1,000,000,000, making us shudder to think that the terms of our nation's obligations are such that while the Secretary of the Treasury under Mr. McKinley will see a gold background to the word 'coin,' a Secretary of the Treasury under Mr. Bryan would have seen only a black background, symbolizing death to our credit and eternal dishonor to our nation's name."

The Bryanites understand this as well as anybody. They know that business revival and national prosperity are impossible while doubt hangs over the standard of value. For this reason they will oppose everything that looks to a change. They are satisfied, in a political sense, with things as they are, because they believe that time is working for them. They are right in thinking so. The only hope for the Republicans lies in progress. If the political complexion of the Senate prevents decisive legislation, they can at least make a start. They can get in line and show what they would do if they had the power. If the action so proposed is on the lines marked out by the Indianapolis conference, that fact will help to restore confidence and also to bring the Senate once more under Republican control.

Mr. Fowler agrees with the Indianapolis conference that the first step should be the funding of the entire Government debt, including all its circulating notes, into bonds bearing 2 per cent. interest. He believes that this can be done. If the bonds are made specifically payable in gold, he is probably right. British 2½ per cent. consols are now selling at 112¼. Our credit ought to be as good. Mr. Fowler has a banking scheme of his own which he thinks would furnish a market for those 2 per cents. We need not go into the details of that plan now, because we think that the sale of a Government bond at 2 per cent., if all doubt as to the standard of value is removed, is possible. Bankers can answer that question. The result would be a saving of nearly $15,500,000 of annual interest. This meets the objection that the Government now saves the interest on the amount represented by its circulating notes. It does nothing of the kind. The existence of these notes, as Comptroller Eckels showed in his last annual report, is a greater expense to the Government than the interest on a corresponding amount of bonds would be. The notes depress the Government credit and prevent it from borrowing at the lowest market rate. Being a menace to the Government credit, they operate still more disastrously on private credit. They are the rock ahead of every business enterprise whatsoever. We shall never have permanent prosperity again while they are outstanding.

These truths need to be reiterated. It is seldom that they are presented more forcibly than they were by Mr. Fowler at Boston. They point the only path of safety to the Republican party. Will the party have the courage to take the bull by the horns? There was one similar occasion when it did have such courage, and it profited greatly thereby. In 1875 the Republicans were in a worse position politically than they are in to-day. Public opinion, looked at superficially, was not more favorable to specie resumption then than it is to greenback retirement now. Yet the party was *in extremis*. Action of some kind was indispensably necessary. It was death to stand still. The party passed the resumption act and was saved.

SOUTHERN ELECTION METHODS.

THE treatment of election contests by Congress this winter merits more attention and commendation than it has received. Less partisanship has been exhibited in the action, both of the House committee and of the whole body, than ever before, and a number of Southern Democrats have been retained in their seats by the votes of Northern Republicans when the cases of the contestants were quite as strong as have served in the past to excuse contrary action. Even when the claim was made that Republican negroes had virtually been defrauded of their rights by the establishment of an educational qualification, through the Australian ballot system, which was not fairly enforced, New England Representatives have refused to turn out sitting Democrats. In the Virginia case of Yost against Tucker Mr. McCall of Massachusetts, in closing his speech in behalf of the sitting Democrat, said:

"We have for years here attempted to build up the Republican party in the South by seating this man and that man and by patronage; and the result is that they display their chief vitality and strength in our national Republican conventions, where they generally appear with as many different delegations as there are candidates for the Presidency. I say, what the Republicans of the South now need is to be treated upon robust principles. They have been coddled to the point of destruction. But, first and foremost, we should do justice to the people of Virginia. That record clearly shows to my mind that the people of the Tenth District are an honest people. And when to day it appears that they have chosen a Representative in conformity with their laws, we should not be guilty of the partisan action of turning him from our doors."

This attitude of the Northern Republicans in Congress shows that all danger of an attempt to revive force-bill legislation is past, and that the nation has finally concluded to leave all the questions involved in Southern election methods to be settled by the people of that section. Undoubtedly this determination will hasten a just solution of the problem. So long as the Southern whites were threatened with federal interference in their elections, local sentiment was devoted to averting this danger rather than reforming the evils which furnished the excuse for force bills. Since the federal election laws were repealed three years ago, public opinion throughout the South has been developing in the right direction more rapidly than during the whole quarter of a century before that time.

The first thing to be secured was a realization of the fact that cheating in elections was an evil not to be endured. This conviction was never before so general as now. The practice was started by whites who wanted to defraud blacks of their votes. As was inevitable, it has been extended in its range until one faction of whites cheats another. This has been done by the Tillman faction against the Conservatives in South Carolina, by the dominant element in Alabama Democracy against first the Kolbites and later the sound-money men, and in Tennessee by the silver wing of the Memphis Democracy against Congressman Patterson's supporters; while the Republicans of the latter State, largely whites, have been defrauded of the Governorship twice in succession by the white Democrats.

Never before has the Southern press reflected so strong a public sentiment against the continuance of such practices as during the present winter. Indeed, the necessity of putting an end to such frauds is now generally recognized as the most urgent issue. An interesting controversy now going on in the Mississippi press shows how the whites of that State are coming to realize that the practical elimination of the negro vote is no assurance of good government. The Vicksburg *Commercial Herald* recently declared that "the single-party condition," which now exists in Mississippi, "means political despotism," and that, by reason of such despotism, scandals on the part of public officials are possible which would be out of the question were party relations normal. Its statement having been challenged, the *Commercial Herald* repeats it with specifications, as follows:

"In the campaign of 1895 the drunken sprees of a certain candidate for high office were simply notorious and gross. But for the abnormal political condition of the State, he would have been forced from the race by the temperance and moral sentiment of the State. On the contrary, he was triumphantly nominated. During the sitting of the Legislature a judicial appointment was foreshadowed of one whose reputation for drunkenness was so flagrant that a revolt was stirred against it. It was heard of no more until the Legislature had adjourned and the check of a Senate confirmation was not immediately impending. Then the appointment was made. Would these things have been possible were there two parties, rivals in the public confidence, in Mississippi?"

No less encouraging from another point

of view is a recent deliverance by a representative black man of Mississippi. Bishop Derrick of the African Methodist Episcopal Church, whose charge covers the States of Mississippi and Arkansas, recently attended a meeting of the bishops in New Orleans, and had some very hopeful things to report. Going from the North, he confesses himself "surprised at the willingness on the part of the business element to accord recognition to colored men who are carrying on commercial as well as farming business"; and says that "the relations existing between the races are far better than I had any conception they were." The Bishop speaks enthusiastically of the provision made by the State for the education of children without regard to color, and the "disposition to enlighten the masses, that they may become intelligent and law-abiding citizens." He proceeds to make this striking statement regarding the suffrage question:

"I do not, like some of my people, condemn the Mississippi Constitution and the 'understanding' clause in it. It may not be just what it should, but yet I think it will tend to help my people. For instance, in all parts of this large State you find negro boys by the hundreds in school, becoming educated. Well, for a while that clause may disfranchise a large number of voters, but in ten years from now that class of men who are going through the schools will become intelligent voters, and will wield the balance of power in politics, thereby giving to the negro a prominent place in the political world."

The Northern Republicans in Congress who refuse any longer to try righting wrongs in Southern elections by passing force bills, or by voting Republican claimants into seats in the House, are fully justified by the course of events. That section only needs to be left to itself, and the decent elements of both races will work out a cure of the evil.

TROUBLE IN THE UNIVERSITY AT ATHENS.

ATHENS, February 1, 1897.

THREE days ago I fell upon a scene that reminded me more of a battle than anything I had seen since I was honorably discharged from the army thirty-three years ago. I was witness of a combat between the military and the strikers when a Greek friend pressed my arm, and, saying, "It is not safe for you here," tried to lead me away. Just then a pistol-shot gave emphasis to his words, but I stayed long enough to see a wounded striker, covered with blood, carried past me still shaking his arm in defiance. Of the soldiers, who were doing their best to restore order, one was severely wounded and others less severely. The strikers complained in the morning papers of that day that the military had not treated them gently enough, and asserted that whatever mischief might now result was to be laid to this unkindness.

But I have plunged *in medias res* without explaining the origin of the strike. Those who know Greece best will be surprised to hear of a strike in a country which they doubtless think of as the one blessed country in the civilized world where the laborer, although his regular pay is only thirty five cents a day, is so satisfied with his lot that there is no war between labor and capital; the one country where socialism and anarchy can get no foothold—a place of plain living and great contentment. This is all true. Here strikes are confined to the University. Their cause is usually a spirit of resistance to compulsory education. Two years ago the University Council decided that the law students should be required to learn Latin enough to read Roman Law in the original. The students decided that this was not necessary. By thumping with their canes on the floors of the lecture-rooms and yelling, they prevented the professors from giving instruction. As they could not endure the spectacle of other departments continuing to work, they demanded of them what would be called in America a "sympathetic strike." This was acceded to, and the result was so much disturbance in and around the University that the military police had to be called in to keep order. At an unfortunate time, when the sympathetic strikers were inclining to go back to work, the chief of police on a trying occasion called the student body by a hard name. This welded them together. They claimed that in their persons the University had been insulted. Some of the professors, also, taking this view, joined the strike, which had hitherto been directed against them. It was now decided that no more work was to be done until the offending chief of police was removed by the Government and the stigma removed.

This was ultimately done under the guise of transferring him to another post, but nearly half of the University year was lost to study by the Latin phase and the insult phase of the strike. The rest of the year was an "era of good feeling." In the reconciliation almost as little was said about Latin as was said in the treaty of Ghent about the impressing of American seamen. During the last days of this strike the students, having plenty of time on their hands, became leading agitators against the Tricoupi Ministry, and undoubtedly contributed essentially to its overthrow. This successful playing of a political rôle was very gratifying to the vanity of the students, who feel amply qualified to manage the politics of Greece.

This year, about two months ago, another great strike arose from the same feeling of resistance to compulsory education. Prof. Galvani, the most eminent surgeon in Greece, who a few years ago consented with great reluctance to take upon himself the duties of a professorship in the Medical School, required what the medical students thought excessive clinical work. When he insisted, they proceeded to break up his exercises by the usual tactics. At one of his clinical exercises they stirred up such a dust that the professor, recognizing the danger to the patient in the critical operation, and irritated at the unseasonableness of the demonstration, called the students "a disgrace to Greece, and the worst students in the world." The students, taking little note of the fact that the patient—a woman—died, perhaps in consequence of the disturbance, raised the old cry of ὕβρις, stopped work, and demanded of the University authorities, not an apology from the professor—that, they declared, would be inadequate—but his deposition. When this was refused, other departments joined the strike, even the theological students going into it with a will. But when, after a little time, the law students, perhaps realizing that a *little* study was not a weariness to the flesh, began to show towards the movement a coldness shared by some of the students' local associations (*e. g.*, one including all the students from the Ionian Islands), the medical students, swarming into the law-school lecture-rooms, made bedlam there also. Then the police came up, and, besides trying to suppress the disorder, searched the students for weapons. This touch of the police was like an electric current making a chemical fusion. The law department as well as all others was now one with the medical department against the common enemy. It was then that the shots of which I spoke at the outset were fired.

The students that day took possession of the University as a fort, provided themselves not only with pistols, but with a considerable number of muskets, provisioned themselves, and defied the police to dislodge them. About five hundred of the three thousand or more students in the University held the fort, while the others remained outside working up sympathy for their fellows and antipathy against the military. For three days and nights this state of things continued. The University declared the Medical School closed, and established a cordon of soldiers about the University, but made no attempt to recover the building, probably more from the desire to avoid bloodshed than from the fear that the besieged would carry out their threat of blowing up the University with dynamite.

The besieged hoisted the national flag over the University, talked of shedding their blood to the last drop rather than come out, and secured the insertion in the papers of the following proclamation to the Greek people:

"O people (Λαέ)! We are your children. Those who have been appointed by you, O people, to protect us, oppress us, persecute us. They insult us, they disgrace us, and, instead of making us reparation, they arrest us, they put us in prison, they slay us. We protest before you, O people, and invoke your aid and your protection. People of Greece! will you remain apathetic spectators of these acts of lawlessness?

"THE STUDENTS OF THE NATIONAL UNIVERSITY."

There was, in fact, much sympathy aroused for these ardent youths, who now became a factor in politics. The Ministry was really in some danger from boys whose talk for a foreigner had something ludicrous in it. But, as the students had announced, as their only offer toward the solution of the question, (1) the reopening of the Medical School, (2) the deposition of Galvani, (3) the punishment of the police, (4) the release of the students already under arrest, the Ministry could hardly do anything but tighten the cordon around the University, and try to starve out the garrison.

On the third day (Friday, January 29), however, the students who remained outside organized a mass-meeting and a procession which was reinforced by many of the populace, making a demonstration that threatened to draw off the cordon of troops from the University. But the chief of police, with another body of troops, met the procession straight in front near the Ministry of Finance on Stadion Street, and dispersed it after some resistance and firing on both sides, in which a boy riding on a horse-car was instantly killed and several persons wounded. The chief of police, riding at the head of his men, was made a target, and had his life saved by his watch, which was battered into a shapeless mass by a bullet.

That night the city was in great commotion. There seemed no reason why, when the situation had become so bad, much worse

things might not happen. In the night, however, the Ministry decided to try mediation in order to get the students to leave the University peacefully. In the morning several professors, accompanied by the Metropolitan of Athens, the highest ecclesiastical authority in Greece, went, at the suggestion of the Prime Minister, who is also temporarily Minister of Education and Ecclesiastical Affairs, and treated with the besieged concerning the evacuation of the University. As the latter had already suffered from lack of food and water, they consented to come out. They assert that not only were their previous demands acceded to, but that also a promise was given that a new rector and council should be chosen, and that full credit should be given for this semester, so much of which had been lost for the medical department in the strike. If all this were promised, it is readily understood why they went out so jubilantly as the cordon of soldiers parted and let them pass. They could hardly have asked anything more unless it were that one of their number should be made Minister of Education. This at least is certain, that whereas the chief of police had proclaimed that they should never come out in a body and with their weapons, he now allowed them to march out with the honors of war, so to speak, not subjecting them to any search whatever, insisting only that the muskets should be left behind. The Ministry denied on the following day that any promises for the future were made on its part, and proceeded to arrest several of the ringleaders as individuals. Again the student body is in an uproar. Most of the professors are reported as saying that the few who went to mediate went as individuals, and were not empowered to represent the University, and that if Prof. Galvani should be forced to resign, they would hand in their resignations in a body. The mediating professors, who yesterday were vying with one another for the credit of effecting "the great solution," are beginning to show a readiness to leave this distinction to the other claimants, now that the students are raising the cry of bad faith against them.

The newspapers, which are, as usual, mostly Opposition journals, make some capital out of the delay of the Government in restoring order; but the *Asty* of January 31 couples this with some reflections of a more wide-reaching character, as follows:

"In the hour when there is opening up before Greece the darkened horizon of the future, and when we ought to see her united, with all her powers bent toward a great object, proceeding on the way of truth and safety in harmony and love—at this moment, alas! we see her rent with factions, without a helmsman, but, also, alas! in want of those who let themselves be guided, without faith and without courage; showing that personally perhaps we Greeks are not lacking in good gifts, but that we do lack the uniting bond, the sentiment of obedience to authority and of mutual responsibility which forms nations really worthy of a high calling."

These words come with a singular propriety, almost solemnity, now that Greece is looking forward to becoming a joint heir with other young and pushing nations in the legacy soon about to be left in the Balkan Peninsula by the Sick Man. No word was so frequent in the mouths of the students and their friends in these exciting days as "honor." How shall this question be settled so as to save the *honor* of the students and not break the *magic spell* of the University? was what seemed to weigh heavily on everybody's mind. Since honor is the subject of their story, would that a leader might arise to teach them the lesson that the "path of duty is the way to glory." X.

CRÖY'S MEMOIRS.—II.

PARIS, February 10, 1897.

THE Duke de Cröy bethought him towards 1764 to have his memoirs copied by a good calligrapher, and had the first volumes bound. "I saw with satisfaction," he says, "that this work, which had frightened me by its size, would be curious." It is curious, indeed, by reason of its great candor and simplicity, and the copies here mentioned are carefully preserved at the castle of Dülmen, the most habitual residence of the present Duke of Cröy.

The Dauphin died on the 20th of December, 1765, of consumption. He was very pious and well behaved. Since the death of Madame de Pompadour, Louis XV. had taken no mistress, and all was quiet at court. The Dauphin died at Fontainebleau, but was buried at Sens, according to his will; his heart only was carried to Saint-Denis. "The Dauphin's death occupied all minds, but at the end of February (1766) the Parlement of Paris woke up and asked the King to reëstablish the ancient Parlement of Brittany, which he had suppressed, and to submit to itself the affair of M. de la Chalotais." Louis XV. went in person to the Parlement, having announced to the First President that he would himself preside on the 3d of March. He arrived with an escort of two regiments of the guards. "Nobody in Paris was aware of it. Louis XV. met, on the Pont-Neuf, the Host which was being carried to one sick. He stopped and kneeled in the mud. When the Host passed, the people, charmed with this action, shouted, 'Vive le Roi!'—a thing which did not happen often." In the great chamber the King was received by the Parlement. "He impressed everybody by his majestic air, and said: 'I come myself to make you my answer and explain to you my will. Here it is, written with my own hand.' And he ordered that his answer should be read. After this was done he ordered that the Parlement's late *arrêté* should be expunged, and saw it done by the clerk. He then retired and returned to Versailles."

Cröy adds that the Parlement tried to resist, and made complaints (they were called officially remonstrances). A deputation took them to the King, who nevertheless maintained his orders. The Parlement came in its turn to make remonstrances in the matter of the Parlement of Brittany; the King answered that he had taken his oath to God, not to the nation, that he had no account to render to the Parlement, and that all authority resided solely in his own royal person. "Everybody," says the timid Cröy, "found this a little too strong." The long struggle between the kings and the power of the parlements was terminated by the French Revolution; but, at the coronation of Charles X., long after the Revolution, nothing was changed in the formula of the royal oath which Louis XV. had opposed to the Parlement.

Louis XV. at length replaced Mme. de Pompadour with the famous Du Barry. "What most occupied society in the month of December, 1768, was the apprehended presentation of a Dame Du Barry, which was making much noise. The *libertins* screamed the loudest, . . . the discreet who loved the King wept, prayed, and were silent. We must do the same." The presentation was postponed for some time, from day to day, chiefly by a fall of the King on the hunting-field, but finally took place on the 22d of April, 1769. Mme. Du Barry was presented alone, no lady being present. "It made an enormous sensation." In April, Cröy went to Versailles. He tells us that

"the King, notwithstanding his sixty years, was more in love than ever with the new lady. She amused him; he looked younger. There was a question whether or no she would attend the coming wedding [of the Dauphin with the Archduchess Marie Antoinette], for which she had ordered charming clothes. She was fond of dress, and would have been inconsolable without an occasion for putting them on. She was good, and with the exception of her hatred of the Duke de Choiseul, with whom she found herself every day at his Majesty's, she wished no ill to anybody. I was surprised to see that, amiable as was M. de Choiseul, he did not attempt to win her good graces, but seemed to brave her."

Cröy gives an accurate description of the magnificent festivals which took place on the occasion of the marriage of the Dauphin. "Notwithstanding the general distress, France wished to surpass Vienna. . . . For us three the clothes cost more than 22,000 livres. . . . It could be said with reason that this was not very philosophical for an age which prided itself on its philosophy." We note in Cröy's long account that at the King's supper at La Muette, on the day of the arrival of the Archduchess and on the eve of the marriage, there were forty people seated, among them the Countess Du Barry, "which made people judge that she would soon crush the party which was opposed to her." Her influence, in fact, by degrees came to surpass that of Mme. de Pompadour. As she was not "born," she found it difficult at first to surround herself with ladies of rank, but she soon found friends and admirers of both sexes; she disposed of all the favors. She had completely captivated the old King, who, "at sixty-one years, was as much in love as ever." Mme. Du Barry was allowed to send her orders directly to the Treasury. The Abbé Terray, comptroller of the finances, tried in vain to balance the receipts and expenditures. "He attempted retrenchment, as if retrenchment were possible at Versailles. There were three millions and a half to provide for the prodigious household of the Count de Provence [who had just been married]; the household of the Count d'Artois threatened to be as large. The passion for hunting of King and Dauphin necessitated thousands of horses."

Louis XV. fell ill on the 29th of April, 1774, at Versailles, and was twice bled the same day. He had felt unwell for a week. Cröy gives an account of the King's malady which is almost as detailed and accurate as a doctor's bulletin could be. In a medical point of view it is really interesting, as it shows the development and progress of the smallpox, of the kind called confluent. It is interesting also as showing minutely the change of sentiment of the court during the malady. Cröy shows us "Mesdames, that is to say, the three daughters of the King, standing at the foot of his bed, . . . the King, in a military bed, in the middle of the chamber, seemingly tranquil, but with a red and swollen head. . . . The ministers, the Prince de Soubise were there. The Duke d'Aumont dealt with the doctors and did it well. . . . Madame Du Barry was encouraged only by her partisans, for she said: 'I displease the entire family; let me go.' Yet the habit of the King to see her made her feel that she was useful to him. She seemed to sacrifice herself by staying."

When the King himself found out that he had the smallpox (he would not believe it at

first, having already had it once), he said to Madame Du Barry: "Now that I know my condition, I will not renew the scandal of Metz; if I had known what I now know, you would not have stayed here. I owe myself to God and to my people; you must retire." Madame Du Barry fainted; then withdrew. Up to that time the impulses of the court had been various. "According to the fears of the party, people rushed to pay their court to the lady, and everybody was in the air except myself, who had never visited her. In the evening they were quite triumphant, as the Archbishop could not enter and the fears of the King were dissipated." When the King dismissed his mistress, he sent for M. d'Aiguillon, and ordered him to see to all the details of her departure. The Duchess d'Aiguillon conducted her to her house at Rueil. Some time afterwards the King said to his valet, Laborde, "Go and fetch Madame Du Barry." Laborde answered: "Sire, she is gone." "Where is she gone?" "To Rueil, sire." "Ah, already!" The King prepared himself for the last sacrament. "It was a long time since he had made confession, the last time being for the affair of Madame de Mailly, in 1736."

It is curious to see how Cröy explains the calculations of the King with regard to his salvation:

"The King," he says, "wished not to render his own life too sober if he recovered, for it had become indispensable for him to have an apartment where he could go and talk freely, his family having become useless to him for that, on account of the life which he had led. In consequence, he thought that he could content himself with receiving the sacrament *in articulo*. He had his great bed arranged; he waited for the moment, and did not wish to embarrass himself for nothing. So it appeared that, whatever may have been said, he had all his senses, and it was conformably to this plan that he had had the lady removed, and said to himself, 'Let us act for the present.' He could not bring himself to make pledges."

These combinations and calculations, which Cröy sets forth with a certain candor, show us Louis XV. as a negotiator who is willing to treat and make promises only under the pressure of an immediate necessity. From his confessor, an humble priest who was patiently waiting, he could obtain absolution only by promising never to see Mme. Du Barry again; but he was willing to make this promise only if he felt certain that death would separate him from her. He was, with all that (or thought he was) a good Catholic; he said his prayers, he heard mass with much fervor. His end was not without dignity. After he had received the extreme unction, he spoke to the Cardinal, who said to those who were in the next room: "Gentlemen, the King charges me to tell you that he begs God's pardon for the offence he has given to him and for the scandal he has brought upon his people. If God gives him back health, he will occupy himself with doing penance, with upholding religion, and with doing good to his people." The King added: "I should like to have the strength to say this myself." This was on the ninth day of the malady. He died on the tenth day, with much courage and resignation (May 9, 1774). He was not regretted, except by his immediate entourage. Cröy, who had a real affection for him, says: "In general, I was not at all satisfied with the nation. As the weather was fine, there were many people out during these two days, in the park, and people walked as usual. All the inns were full, and nobody, outside of the apartment, seemed to be moved. It was no better in Paris. . . . A stranger would not have known that we had lost a King."

The new King was hardly twenty years old. He had three aunts, the unmarried daughters of Louis XV.; there were besides these princesses the Queen, Madame (the Countess de Provence), Madame d'Artois. This made, with two sisters, eight ladies with whom he had to live, all having their ladies in waiting —altogether, as Cröy remarks, about a hundred women, some of whom were very clever. "It was no small affair, at a time when nothing seemed great but the affairs of the Court." Cröy enters into many interesting details about Marie Antoinette's début as Queen. We cannot read all these details without emotion when we think of the tragical end of this unfortunate princess, "pretty as the day and full of graces." Cröy himself was fortunate enough not to see the troubled days of the French Revolution. He died on the 30th of March, 1784, in Paris, in his hôtel in the Rue du Regard. I have read few books or memoirs which have given me a more vivid account of that time of which Talleyrand used to say in his old age: "Those who did not live in France before the French Revolution do not know what pleasure it is to live."

Correspondence.

THE PRINTING BILL IN THE SENATE.

To the Editor of The Nation:

Sir: I have read your article of the 18th inst. concerning the bill to improve the printing and binding methods of the public documents, with mingled feelings of satisfaction at your approval of the bill and dismay at your method of advocating it. My judgment and my experience convince me that perhaps the worst way to secure the enactment of a project of legislation is to begin by sweepingly antagonizing and censuring the enacting power. In this case I have also the conviction that such censure is unjust.

While the stubborn fact remains that the bill has not been passed, and has not even been reported to the Senate for its consideration, yet it is equally true that all of the Senators with whom I have talked or corresponded on the subject have recognized the importance and merit of the measure, and all of them (except Senator Hale) have assured me of their intention to vote for it if it came before the Senate. Senator Hale is chairman of the committee on printing, to which the bill was referred, and of course to him is due the fact that it has not been reported; yet even he assured me that he was not to be considered as opposed to the bill, but as deeming it of such importance that it ought to have more consideration than he had yet been able to give it.

Of course, from my point of view, and from that of librarians and scholars generally, the bill is of such importance that time ought to have been taken to consider it and report it and put it to vote, but I cannot assume that it has thus impressed Senator Hale. It seems to me more just to assume that he has passed it over because his time was occupied with measures which to him seemed of greater public importance, and I do not feel that I have a right to say that a difference of opinion on this subject implies any wrong-doing.

I am confident that when the document-reform bill comes before the Senate, it will pass by a vote practically unanimous, and that its operation will give such satisfaction that everybody will wonder why such a bill was not devised and enacted years ago. If passed in its original form, it will, for one thing, save in printing and binding double the total cost of carrying on my office, and this without at all reducing the number of books. In fact, the number will to all intents and purposes be greatly increased, because the demand will be reduced by cutting off the duplications which now arise from the practice of printing one book in many editions. I am equally confident that the bill will come before the Senate at a seasonable period in the next Congress, and, if it does so, and is received as I anticipate that it will be, I trust the *Nation* will improve the opportunity to recognize the open-mindedness of the Senate towards a measure which looks solely to the public good, and has in it no element of personal advantage for anybody.

F. A. Crandall,
Superintendent of Documents.

Washington, February 19, 1897.

[We did not mean to imply that our knowledge of senatorial opposition to Mr. Crandall's bill, and the absurd reasons for it, came from him, or were hinted at in his report. We shall cheerfully recognize the open-mindedness of the Senate when we see it. We shall also speak freely of the opposite quality whenever we see that.—Ed. Nation.]

SCARCITY OF MONEY AT THE SOUTH.

To the Editor of The Nation:

Sir: In your "Report on the Indianapolis Conference" in the *Nation* of February 11, you call attention to the following passage in the speech of Mr. William E. Dodge: "I found that there were great sections of the Western and Southern country where there was absolutely no money at all; where the most primitive forms of barter obtained. . . ." The *Nation* endorses this by saying, "That the condition described by Mr. Dodge exists in large districts of the South is undoubtedly true."

We down here have heard a good deal about these "great sections" of late years, but have never become much excited over the news. The assertions, coming invariably from the same sources, have located "the sections" in such a vague, treasure-island sort of way that we have to regard them as mere bits of poetical figure used for rhetorical emphasis or wadding, as one or the other might happen to be needed. "Great sections" is a good elastic term, and is handy for speech-making, but no speaker has been so accurate as to even name a State in which such a section can be found. Such a section in an agriculturally rich, or any other sort of rich, country is an impossibility, and such talk is absurd; it is the same old twaddle of the silverite, that a man can be rich in everything else, and yet be starving because the "per capita" is deficient. The poor people have no money, but that is because they are poor; they are not poor on account of the low "per capita." As long as corn, oats, cotton, hay, hogs, or manure are worth a fraction of a cent a hundred, these people can always get cash for any surplus they have.

We protest against such a slander as that there is any agricultural section in the South larger than a county poor-farm where none

of the inhabitants earn more than they consume. Many of our people *are* poor, and much of the business *is* done by barter; but the very poor in sparsely settled countries have always bartered to some extent, because where there is only one store in ten miles they usually buy and sell with the same man; it is more convenient.

Up to 1893 the most prosperous inhabitants of our agricultural sections were planters who rented their land, in small sections, to negroes and poor whites, and set up what is known as a merchandising and advancing business. Here they advanced one hundred dollars' worth of hog meat, cottonseed, trace-chains, and calico at a good round profit to themselves, and, at the end of the year, took (in barter) one hundred and twenty-five dollars' worth of cotton and corn in *part* payment of the debt. They always liked to have a small balance against the barterer to carry over, to preclude the possibility of his moving away and trying his bad luck elsewhere. Since 1893 the merchandising and advancing gentlemen have been on the road as silver-tongued calamity howlers, and the poor whites and negro renters have worked on, lived cheaply because they could get no credit (found out for the first time, in fact, that they *could* live without it), and at the end of the year found themselves with more coon-skins' worth of cotton and corn than they ever had before. Some few of them, indeed, see a few dollars now and then.

On closer reading of your article, I am pleasantly disappointed to find that Mr. Dodge's source of information regarding our large desert sections is the same with which we here are already acquainted, and that his exploring tour extended no further South than Indianapolis.—Yours, etc.,

G. S. Brown.

Birmingham, Ala., February 13, 1897.

THE RETREAT OF THE MOSLEM.

To the Editor of The Nation:

Sir: In the interesting letter on North Africa in last week's *Nation* the writer makes the statement that the Mussulman population is "fast vanishing" from Bosnia. According to the official census taken in 1879, soon after the Austrian occupation of Bosnia and Herzegovina, the population numbered 1,212,172, of whom 448,613 were Mussulmans. In 1895 the total number of inhabitants was 1,568,092, of whom 548,818 were Mussulmans. The truth is, that the European Mohammedan peasant, when justly governed, is a law-abiding citizen who lives peaceably with his Christian neighbors, and is subject to the same natural laws of increase as they. While in Bosnia there is no evidence, to my knowledge, of a change in his faith, in southeastern Russia almost entire villages of Mohammedans have become Christians within a few years.

Jas. M. Hubbard.

Boston, February 16, 1897.

AN UNFINISHED WORK.

To the Editor of The Nation:

Sir: According to a recent statement in the London *Bookman*, quoted in the *Evening Post*, the Clarendon Press is contemplating the publication of the English classics in an *édition définitive*. This is good news to us all, and to no one more acceptable than to the present writer. But would it be too ungracious to remind the Clarendon, before embarking in this new and grand enterprise, that it would do well first to liquidate a small debt of honor of long standing? I refer to the still incomplete Bosworth-Toller 'Dictionary of Anglo-Saxon.' Part I. appeared in 1882, Part II. in 1882, Part III. in 1887, the first section of Part IV. in 1892! There we still stick. Fifteen years, and nothing finished! We are unable to bind up the parts already printed. My private copy is going to pieces; so is the college library copy. This country, from Maine to California, is groaning under the nuisance. Every one, of course, knows the heinous defects of the Bosworth-Toller. But they are incurable by any amount of waiting. Meanwhile there must be nearly a thousand voices in America muttering, Give us our *book*, good or bad, that we may at least bind up and be at rest. Surely the Clarendon does not imagine that we are going to accept as a substitute Henry Sweet's two-dollar Students' Dictionary, just advertised "immediately." What need have we of a students' dictionary? Our undergraduates can make shift fairly well with certain special glossaries; our graduate students require something much more advanced than Henry Sweet is likely to offer. As a long-suffering scholar I advise the Clarendon Press not to forget the ancient motto: "*Noblesse oblige.*"

X.

February 22, 1897.

Notes.

Shortly to be issued by D. Appleton & Co. are a new edition of Professor Laughlin's 'History of Bimetallism in the United States'; 'Pioneers of Evolution,' from Thales to Huxley, by Edward Clodd; Marshal Oudinot's Memoirs; 'Some Masters of Lithography,' by Atherton Curtis; and 'The Aurora Borealis,' by Alfred Angot.

Ginn & Co. announce for April 'Stories from English History,' by Alfred F. Blaisdell.

Macmillan Co. have in preparation selections from the first nine books of the Florentine chronicle of Giovanni Villani, translated for the use of students of Dante and others by Rose E. Selfe, edited by Philip H. Wicksteed.

The Bibliographisches Institut of Leipzig and Vienna has undertaken the publication of an illustrated history of German literature that will doubtless surpass the widely circulated works by König and Lexer. It is being prepared by two professors of German literature in Breslau, Dr. Friedrich Vogt, who does the work on the earlier periods, and Dr. Max Koch, who has charge of the more modern. The publishers promise that the illustrations shall not be too prominent, that only those of real scientific value will be admitted, and that these will be prepared in the very best possible manner. The work is appearing in *Lieferung* fashion, and will cost complete and bound 16 marks.

The subscription or "Outward Bound" edition of Rudyard Kipling's 'Writings in Prose and Verse,' just begun to be published by Charles Scribner's Sons, has all the merits we commonly do *not* associate with "subscription books." A very handsome and legible letterpress is printed on a specially made and water-marked paper; the binding is simple and elegant. Quite unique, apart from the portrait frontispiece, are the illustrations. The elder Kipling, whose facility with pen and pencil was so takingly shown in his 'Beast and Man in India,' has modelled designs in relief for this edition of his more famous son's stories and verse. They not only are in perfect keeping with the style of the book-making, but they are admirable in themselves, whether as characterization, symbolism, or pure decoration. We single out "The Daughter of the Regiment" in volume ii. and "Muhammad Din" in volume i. as gems in their way; and the elephant seal of the title page and cover should not be passed over. The first volume is 'Plain Tales from the Hills'; the second, 'Soldiers Three, and Military Tales,' shows the grouping of kindred subjects which has been attempted in this series. We need say no more except that the edition is fine enough to be definitive; but Mr. Kipling is alive and still productive, and has yet perhaps more than one uniform collection before him ere finis comes.

The care with which Robert Louis Stevenson's slightest works are being preserved after his death again appears in the publication, by the Bodley Head Press (John Lane), of a "fragment of his, written in 1878, on 'A Mountain Town in France.'" Stevenson treated the same subject, a little less broadly, perhaps, in the later 'Travels with a Donkey'; but this essay is none the less interesting, and is written without that elaborate archaism which distinguishes his later style. The pamphlet is limited to three hundred and fifty copies, and has five full-page illustrations of landscape from sketches by the author, which have only a personal interest.

Just a dozen years have elapsed since we welcomed the second edition of Canon Ellacombe's 'Plant-Lore and Garden-Craft of Shakspere,' and now we have a third (New York: Edward Arnold), shorn of the appendices, slightly retrenched in certain places, slightly enlarged with a notice of the daisy, but, above all, illustrated. Major Ricketts has supplied very skilful and decorative drawings of the plants enumerated, copies of old prints of gardens, views of Anne Hathaway's cottage, dainty vignettes of other buildings and scenes, and perhaps the floriated initial letters and headpieces. In short, this delightful book has been rendered still more pleasing, and is sure of a fresh lease of popularity.

Brentano's sends us the second edition of Judge Prowse's 'History of Newfoundland,' which was noticed in these columns, on its original appearance, in the summer of 1895. The work has been both condensed and extended; an additional chapter briefly bringing the history up to date with an account of the woful crash of 1894, and of the heroic struggle to retrieve the financial disaster and establish the colony's credit, together with the latest unsuccessful effort to devise a basis of confederation with the Dominion, and some show of the new hopes which the interior railway and the recent development of the coal and iron resources of the island are inspiring in patriots like our author. An appendix gives the proposed terms of union and the official reports on the mineral deposits. The work is thus freshened and improved, and, as its price is incredibly low, it is equally calculated for an immigration tract and a preparation for tourists, who, we cannot doubt, are going to multiply even if the immigrants other than miners do not. A dollar and a half, in fact, puts one in possession of more than 600 pages of learned and entertaining and authentic text, a host of capital photomechanical illustrations, and a map. The third edition, or we mistake Judge Prowse's striving for perfection, will include an index.

The work bearing the singular title, 'Cyclopædia of Practical Quotations,' was first pub-

lished in 1882, and, having undergone a thorough overhauling and verification, is now brought out anew (Funk & Wagnalls Co.). It has been enlarged by nearly a third, and in many details exhibits a decided improvement. The index seems very minute, but we cannot think it worth while to have included in it the English versions accompanying the foreign quotations—at least indiscriminately, as has been done. *Mass* will help one to Henri IV.'s "Paris vaut bien une messe" (given unconsciously in an alternative form, "La couronne vaut bien une messe ou Paris vaut," etc.), and *candle* to "Le jeu ne vaut pas la chandelle"; but who could ever think of *bab blings* as a clue to Dante's "Vien retro a me, e lascia *dir* le genti"? It is, further, an odd conceit to refer to the bottom of each page of the index from quotations from Shakspere, Milton, Wordsworth, Byron, Tennyson, Lowell, Pope, and Longfellow. The considerably augmented list of authors now has references to all the respective citations. With all its apparatus, the work will chiefly serve, not those who wish to recall some saying, but those who seek an appropriate motto or sentiment or rhetorical embellishment. For this the classification answers well enough.

Readers who revel in the countless curiosities of the law will find much to amuse and something even of instruction in 'Legal Lore' (London: William Andrews & Co.), a collection of twenty-one essays by fifteen authors, devoted to as many topics in the legislation of England and Scotland, from Saxon times to the present. Law and custom reflect, as in a faithful mirror, the ideals of successive generations, and throw a search-light upon the social conditions of the past, so that even such popular disquisitions as these have their value to the student as well as to the general public. Of course in such a miscellaneous group as the present the component parts vary greatly in interest; some are decidedly amateurish, and others are scarce more than agglomerations of anecdotes, while there are a few, like that of Mr. Neilson on "Post-mortem Trials," deserving of permanent preservation. A wider outlook would have preserved the volume from the reproach of insularity, but this defect has its counterpoise in the fact that British conservatism has preserved the flavor of mediævalism to an extent not to be found in lands exposed to the revolutionary influence of codes founded on the imperial jurisprudence. The island, therefore, affords an unrivalled field for the legal antiquarian who delights in tracing survivals, and in seeing how forms may be piously preserved while substance is modified to meet the requirements of changing environment.

'The Principles of the Transformer,' by Frederick Bedell (Macmillan Co.), is an extended treatise upon the alternating current transformer in which the treatment would leave an uninformed reader somewhat doubtful whether a transformer belongs in the realm of mathematical hypotheses or of useful machines. The book will doubtless be of interest to teachers and students of mathematics and mathematical physics, but it offers little of attractiveness or profit to the designer of actual transformers or to students of engineering. In this respect the book presents a marked contrast to a little volume on Transformers by Gisbert Kapp which has been lately issued by the same publishers.

'What is Electricity?' by Prof. John Trowbridge (D. Appleton & Co.), is an attempt to explain in a popular manner the most approved scientific hypotheses in regard to the nature of electricity. We have reason to expect real success in any effort undertaken seriously by one of Prof. Trowbridge's reputation, and he has as nearly succeeded as the chaotic condition of scientific knowledge will permit. A complete popular explanation of the nature of electricity would tax the powers of a Tyndall, since the first requirement is to overset entirely several cherished popular conceptions before it is possible to make clear the interdependence of electricity, magnetism, light, and heat, and their common dependence upon a hypothetical and all-pervading ether. Were this huge undertaking thoroughly performed, even then the result might have doubtful utility, since our most advanced ideas upon the nature of electricity, light, and the ether are little more than mere speculations or hypotheses. The true scientist is ready at any time to accept a reasonable hypothesis which seems to fit his knowledge, and to use the theory as a guide in his search for additional facts; but upon any shifting of his bearings which discoveries may bring about he must be ready to throw over the old and look for new theories. The popular mind needs more tangible and enduring foundations for its views, so it is hardly probable that any popular work upon electricity, light, and the ether can truly attain its object until we have more settled facts relating to these important phenomena. Prof. Trowbridge's book will be interesting to students of science and to many others, even if it is not popular in the full meaning of the term.

The second volume of Mr. Foster's Monthly Bulletin of the Providence Public Library, for 1896, is before us, testifying to his assiduity as a bibliographical purveyor in the domain of current history. The first number contains an alphabetical list of the reference lists published in the accessible bulletins of other libraries since October 1, 1895, and renews the Providence Library's own series with No. 26, "Venezuela and its Boundaries." The closing number brings us No. 38, "William Morris," and a general index. Such lists, and this is notable of its kind, serve as a sort of Annual Register as well as guide to reading. Mr. Foster's entries are freely annotated for intelligent selection.

The Germans are far from ready to adopt such drastic methods of modernizing secondary education as the Norwegians have recently initiated by dropping the Greek absolutely, and substantially the Latin also, from the gymnasium course. Dr. Alex. Wernicke's 'Kultur und Schule: Präliminarien zu einem Schulfrieden' (Osterwieck: A. W. Zickfeldt) belongs to those numerous publications, aiming at a reconciliation of the old and the new, which almost every month brings forth. We call attention to this particular treatise as presenting a well-studied plan of satisfying the just and irresistible demands of modern life without ruthlessly disregarding the historical development of the higher culture in Germany.

A more radical project of reform is advocated by Harold Arjuna in 'Klassisch oder Volksthümlich? Auch ein Beitrag zur Lösung der Schulfrage' (Leipzig: Gustav Fock). This writer, who seems to disguise his real name and has had his pamphlet printed at Brussels, has taken for his motto Ulrich von Hutten's *Ich hab's gewagt*. To him the gymnasium appears like the "leaning tower" whose base is deranged. It must become Germanic or perish: *Tertium non datur*. He is well informed and actuated by humane and patriotic motives, and writes from the fulness of the heart; but the constructive part of his plan is decidedly fanciful.

At a recent meeting, in Chicago, of the North Central Association of Colleges and Secondary Schools, a resolution was passed looking toward the checking of the tendency to intrust freshmen classes in the colleges and universities to young and inexperienced teachers. This brings to mind a passage in Dr. Adolph Wagner's *Rectoratsrede* on the Development of the University of Berlin (Berlin: Julius Becker), in which the disproportionate growth of the docent system in that institution, and in some other German universities, is exhibited. The University of Berlin started on its career with a faculty of forty-six, of whom fourteen were docents. In 1830–31 the proportion of the whole number of instructors to that of docents was 121:32; in 1870 it was 168:61—*i. e.*, between 1830 and 1870 the number of docents had doubled, while the entire corps of instructors had increased by only one-third. In 1896 the proportion is 345:167—in other words, nearly one-half of all the teachers are unsalaried docents. In the eighty-five years since the foundation of the university, it thus appears, the whole faculty had grown to between seven and eight times its original size, while the number of docents had increased twelve-fold. Vienna had in the same year (1896) nineteen more docents than Berlin, in a faculty equal, in the aggregate, to that of the latter university.

M. Alfred Fouillée, writing, in the *Revue des Deux Mondes* for January 15, on youthful criminals and the influence of the school and the press, proves conclusively, at least for France, the inefficiency of the modern public school as a remedial agency against crime. The writer does not hold the State schools directly responsible for the alarming increase of vice and crime among the young; but the predominance of intellectual over moral training, and the superficial character of the instruction in the public schools, he considers pernicious. Anti-religious intolerance, which is "as fatal for a nation as religious intolerance," also exerts an unfortunate influence; moral scepticism among the young is usually the result of religious scepticism. But even under the most favorable conditions the teacher can never take the place of the family. Alcoholism, among the parents, and a licentious press are terrible curses, and these two causes of juvenile depravity call urgently for speedy and effective legislative action.

—The seventeenth annual report of the Director of the United States Geological Survey, for the fiscal year 1895 '96, has been lately distributed in advance of the geological essays to accompany the volume in which the report formally appears. Director Wolcott has thus a second time succeeded in issuing with commendable promptness his statement of work accomplished and in hand, from which those interested in the progress of this great national undertaking may almost accompany its progress. An item of popular interest concerns the report in preparation by Mr. Gilbert on the history of Niagara Falls, in which will be presented full evidence of a former northerly discharge of the waters of Lakes Michigan and Huron direct into Lake Ontario. The volume of Niagara River has therefore undergone great variation; the value of the retreat of the falls as a geological chronometer must be set rather low because of the variable rate of their recession. Another popular item is found in a brief mention of discoveries by Mr. Leverett regarding

the post-glacial origin of the Ohio River. Its upper waters, the Allegheny and Monongahela, formerly discharged into the basin of Lake Erie, as has been known for some time. Now it is discovered that the Kanawha River of West Virginia, bearing drainage even from the mountains of North Carolina, also formerly ran northward across the State of Ohio, following a line partly coincident with the south-flowing Scioto of to-day. The diversion of all these rivers to their present discharge by the Ohio is ascribed to the obstruction of their northward drainage by an ice-sheet of the glacial period; and a good part of the great water-way which has exercised so strong an influence on our history must consequently be considered as a cross-country patchwork of many rivers formerly independent. Great has been our advantage from the change, for it has allowed the settlement of the lower Ohio valley to be accomplished with the grain of one large river, instead of up hill and down dale, across the grain of many smaller rivers. During the year twelve geologic folios, Nos. 15 to 26, were published under the editorship of Mr. Willis, their price being generally twenty-five cents. The public is evidently unaware of the high value, great beauty, and low price of these superb publications. A list of the folios and their prices may be had on application; every student of our country's resources should have them in his library.

—The third volume of Mr. Thwaites's 'Jesuit Relations' (Cleveland: Burrows Brothers Co.) appears on the stroke of the clock, bearing signs of unremitting diligence. The action still centres in Acadia, whence we have already seen that the missionaries were expelled by the Virginians. On his return to France, Father Biard hastened to send a report of the St. Sauveur colony and its untimely end to Acquaviva, then General of the Order. He dated this Latin letter at Amiens, May 26, 1617. Two years later, and evidently after mature deliberation, he issued in French a formal "Relation de la Nouvelle France," designed with much skill to refute some specific attacks on the Jesuits of Port Royal. These are the pieces now presented in 285 pages of text and translation. How engaging is good Father Biard when he endeavors to put his anonymous adversary, perhaps Lescarbot, in the wrong and at the same moment to edify his readers by a prospect of ungleaned harvest fields! The poems of Ossian are not more fervid than the prose periods of the returned missionary. Among the polemical matters touched upon in Biard's Relation, the quarrel between the fathers and Biencourt is most prominent. According to our author, Simon Imbert poisoned Biencourt's mind by convincing him that the Marquise de Guercheville had sent the Jesuits over "de l'expulser hors de ses amples Seigneuries de Canada." It is much to Biard's credit that he keeps his temper and ascribes the root of the trouble to the devil. The Indians fill a large space in the narrative, but the Siroquois and Abenakis were tame creatures in comparison with the children of the Five Nations. We occasionally get a glimpse of French customs in these descriptions of Indian life. For instance: "Ils usent aussi du petun, et en boivent la fumée, de la façon commune en France." We are pleased to observe that the headline of the right-hand page has been changed from "The Jesuit Relations" to "Biard to the General," "Biard's Relation, 1616."

—Hippolyte Lencou's 'Le Théâtre Nouveau' (Paris: Savine) purports to be an inquiry into the influences at work on the contemporary dramatic movement in France. It has been inspired by the success which marked Huret's book on the literary movement, some years ago, but it is not likely to attract as much attention, although M. Eugène Fournière, who furnishes the preface to this new "enquête," is convinced of the contrary. Lavedan, Donnay, Curel, Maeterlinck, Jullien, Ancey, and Becque are the most important of the writers interviewed. Each has his own ideas of what the stage needs, and these ideas are in some cases absolutely antagonistic. Curiously enough, several of the authors mentioned meet on common ground, and, while seemingly hostile to all that has been done hitherto, hark back to Racine, in particular, as the great model. They have not much to say in favor of Dumas *fils*—rather they attack his drama; but they call with fair unanimity for the drama of "ideas" and the abolition of conventionality on the stage. The creation of characters, naturalness, diminution of episodes—these are some of the points on which there appears to be a substantial consensus of opinion among them. Rodenbach and Maeterlinck, it is true, are in favor of what M. Lencou calls "le théâtre muet," which is simply pantomime. According to M. Lencou, all the writers he has interviewed are "masters," and have produced masterpieces. It would be more correct to say that several of them have met with a fair measure of success, and may possibly produce a lasting work before they end their career. There is actually no dramatist of the first rank in France at the present moment. Dumas may not retain the high rank he occupies at this time, but there is surely not one among the men in M. Lencou's list who can be expected to displace him.

—The opinion of Sarcey may be considered biassed by prejudice, so far as the works of the younger school are concerned, though we should not, for our part, subscribe to such a judgment; but that of Lemaître is much the same as his, and Doumic, himself one of the "Jeunes," is not carried away by enthusiastic admiration when he discusses their works. In his latest book, 'Essais sur le Théâtre Contemporain' (Paris: Perrin), he examines the plays of four of the authors whom Lencou has interviewed; namely, Lavedan, Donnay, Curel, and Rodenbach. He looks upon them as men of talent and promise, but his deliberate judgment on their most recent productions is by no means favorable. They do not succeed in seizing on the real point of interest; they start out to do one thing and end by doing another, without quite understanding how they have managed, or mismanaged, it. The success of a play with an audience thoroughly in touch with the life depicted in it is not a sure gauge of permanent success, and this is the mistake which M. Lencou repeatedly makes. Apart from the studies referred to, M. Doumic's book contains an instructive chapter on Dumas's drama and two of his own Odéon lectures, the one on Pierre de Larivey, the other on Picard.

—In a vehement pamphlet (Paris: P. V. Stock) M. Bernard Lazare again takes up the cause of the unfortunate Capt. Dreyfus. A previous edition called forth a reply from the *Eclair* of Paris, which M. Bernard-Lazare considers inspired and now endeavors to refute. Without the record of the court-martial before us, it would be impossible to pass finally upon the merits of the case; but the Government's story, as told by its organ, is a sorry one. According to that authority, Dreyfus was a bad character; a busybody among the offices of the War Department; a conspirator whom all disliked and suspected, and who carried guilt in his face. The French secret service had for some time prior to 1894 been bribing the concierge of the German embassy at Paris to secure its office-sweepings for them, among which they one day found a torn wrapper, purporting to have contained documents relating to the arming and disposition of French troops, a list of which was endorsed in French on its back. A cipher letter, previously filched, had spoken of some "animal de Dreyfus"; and because of this allusion and a supposed similarity in his handwriting to that on the wrapper, Capt. Dreyfus was charged with treason, court-martialled, degraded, and exiled for life to Cayenne. As appears from the *Eclair*, the trial was principally a dispute among experts in handwriting, proved nothing positive, and was finally decided by the secret transmission among the judges of a letter whose contents are still undivulged—an expedient hitherto unheard of, except in cases like that Scotch political trial of the last century, described by Stevenson, where a similar mysterious "paper was handed round (like a curiosity) in court; passed through the jury-box, where it did its work; and disappeared again (as though by accident) before it reached the counsel for the prisoner." That trial ended in murder.

—M. Bernard-Lazare contends, on the other hand, that Dreyfus was an exemplary character; a married man, rich beyond temptation. He was no busybody; none of his acts were suspicious. The letter stolen from the German embassy alluded to no Dreyfus at all, but to some one designated as "D." Moreover, another man whose name began with D had been suspected before Dreyfus. The incriminating wrapper is not in Dreyfus's writing; Dreyfus could not have procured the documents it purported to contain; it is very doubtful if any such documents ever were furnished the Germans by any one. As to the details of Dreyfus's arrest, trial, and punishment, the axiom of the French criminal law that the accused is presumed guilty until he is proved innocent, and its procedure, which makes him a witness against himself, are sufficient to prejudice an Anglo-Saxon against any French trial, no matter how certain the guilt of the accused. In the present case, however, the War Office's very evident zeal to convict seems to have been quickened by popular fury against a supposed traitor who had the misfortune to be a German-speaking Alsatian and a Jew.

—Two manuals for the study of Modern Greek have lately appeared, which fill a gap in our educational apparatus, and which are designed for somewhat different classes of students. Mr. Rizo-Rangabé's Method (Boston: Ginn & Co.) is a concise volume of about 200 pages, with vocabularies and exercises well chosen and well arranged, which reveal the experience of the practical teacher. It has the merit of presenting, in addition to the general principles of the language, the chief features of the "vulgar" usage and speech, if those fresh dialectic or vernacular forms and constructions can fairly be called vulgar which lend vividness and charm to the poetry of Solomos and the folk ballads, and are still, fortunately, retained in familiar conversation even among the educated. These flowers of a new spring, legitimately growing from the ancient soil—this young blood—will inevitably be retained, by the natural process of development, to decorate and invigorate the somewhat color-

less and artificial literary language which the modern purists are developing too exclusively and mechanically upon an antique mould. It is a whimsical fact that some learned Greeks are rather ashamed of having "lived and loved" since the days of Xenophon. But murder will out, and the young Greek blood cannot be disguised or concealed. It is from this homely popular strain that the rejuvenescence will inevitably come, as it has in all the great European literatures.

—Dr. Stedman's 'Greek Mastery' (Harpers) is a more bulky work, fitted for private study, but not so well adapted for purposes of reference. The vocabulary and practice are supplied chiefly by progressive reading-lessons, translated in parallel columns. The rules for pronunciation are specially minute and accurate. Dr. Stedman is an enthusiast for the modern tongue; he thinks it might be agreed upon for the universal language; and he calls his manual a "Short Road to Ancient Greek," which he believes ought to be approached from the modern side, just as Englishmen go back to Chaucer from English of the nineteenth century. We grant him that the method he advises is an excellent one for any person who has had the accidental privilege to be born in Greece, and has therefore acquired the modern tongue without expense of time or money. Such a one has certainly a long start towards classic Greek, as compared with an Englishman or a Frenchman. But for people in general the shortest cut to the treasures of the ancient literature is evidently through the ancient language. This need not be a long process, though the teachers often talk as if it must be. We know a boy who in a single year was thoroughly prepared in the Greek requirements for admission to Harvard. For the foreigner, the modern literature and language must remain a tit bit—a delightful after-course to the ancient literature; it is, above all, a key to the heart of a living people—to their thoughts and ways. Hence, the bachelor of arts, masculine or feminine, of our American colleges who has been so unworldly wise as to include Greek in his studies, will find Dr. Stedman's manual, or Mr. Rizo Rangabé's, a useful book to put in his trunk when he purposes a visit to Athens on his way to Cairo or Constantinople.

THE STORY OF BOHEMIA.

The Story of Bohemia, from the Earliest Times to the Fall of National Independence in 1620. With a short summary of later events. By C. Edmund Maurice. [Story of the Nations Series.] G. P. Putnam's Sons. 1896.

It has been the lot of the Slavic peoples to pass through long periods of foreign domination. Russia had to bow before the Tartar khans; Bulgaria and Servia were swallowed up in the flood of Ottoman conquest; the yoke of Muscovite and German has been fastened upon the Poles; the Croats have writhed under that of the Magyars; the national life of Bohemia was extinguished in the fires kindled by the Reformation. But Slavic blood is tenacious of its existence, and a Slav subdued is not a Slav suppressed. Serb and Bulgarian have emerged in unimpaired vigor, after a thraldom of centuries, from the receding tide of Turkish rule; the Pole clings desperately to the dream of a resuscitated fatherland; the Croat refuses to surrender his nationality to the Magyar; and the Czech of Bohemia is struggling to emancipate himself from the sway of the Teuton.

In the eighteenth century the world was oblivious of the presence of the Czech. In the nineteenth century he makes himself loudly heard in the effort to reassert his autonomous existence. The Czechs of Bohemia have before them to-day the spectacle of their neighbors, the Magyars, celebrating the one-thousandth anniversary of the establishment of their Danubian realm, the spectacle of six or seven million Turanians lording it over nearly ten millions of Slavs, Rumans, and Germans. The Slavs of Bohemia and Moravia are not so very much inferior in numbers to the Magyars of Hungary, and outnumber the German population within the bounds of these provinces. They have their tradition of national greatness, the memory of the rôle they played in history, and they cannot conceive why they should not be entitled to the same position of autonomy in the realm of the Hapsburgs that the Hungarians enjoy. The accomplished fact of a dual Austro-Magyar monarchy, a strange structure, indeed, but one which has been reared upon a stable foundation reaching deep into the past, and whose continuance is considered to be essential to the preservation of the equilibrium of Europe, does not appeal to the mind of the Czech. He refuses to recognize (and naturally enough from the standpoint of the militant Slav) the obstacles in the way of a triple federal system, a political partnership of German, Magyar, and Czech, to which ere long the Poles of Galicia would claim admittance. Heedless of the entanglements of the future, of the prospect of being swallowed up by Russia, or of being annexed to Germany in the event of a disrupted Austria, he is bent upon restoring the realm of St. Wenceslas and regaining supreme command of the region in which he considers the German only an intruder.

The great migration of nations which swept away the Roman Empire and revolutionized the ethnographic features of the European continent brought the Bohemians, about fourteen centuries ago, within their present abode. The flood which had been let loose from the seat of the old Slavic nation in what is now western Russia kept rolling westward until it reached the lowlands of the Elbe. The returning tide of German conquest, ushered in by the victories of Charlemagne, pressed back the boundaries of Slavdom, the Germans poured into the regions once occupied by their kinsfolk, and at last the land of the Czechs was left as a Slavic peninsula projecting into Teutony. Even here the complexion of the population was changed by the continued influx of German settlers (whose advent was welcomed by reason of their industry, technical attainments, and learning), and Bohemia and the adjoining region were destined to become and to remain a disputed ground between German and Slav. The beginning of the fourteenth century witnessed the extinction of the ancient Czech dynasty of Premysl, under which for a brief time, in the reign of Ottocar II., Bohemia was the most powerful member of the vast assemblage of states that made up the Holy Roman Empire. The establishment of a German dynasty, that of Luxemburg, the elevation of Charles of Luxemburg to the imperial throne, and the foundation by this sovereign of the University of Prague (the first university within the bounds of old Germany), worked powerfully in favor of Germanization; but in the Hussite convulsions of the following century the Czechs gave proof of a new national vigor. Nevertheless, though their indomitable spirit asserted itself on the battlefield in a manner to startle the world, it did not prove equal to the task of building up a powerful and permanent national Slavic monarchy. Never-ceasing internal dissensions and a labyrinthine complexity of political constitution hindered such a consummation. The realm of St. Wenceslas at the close of the Middle Ages—this kingdom of Bohemia, with its dependencies of Moravia, Silesia, and Lusatia, with its inextricable maze of jurisdictions of every sort—was a reflex of the complex fabric of the German Empire itself. The people came to regard it as a natural thing to be ruled by princes belonging to foreign dynasties. When, after an interval of a century and a half, the Czechs once more tasted the satisfaction of having a national king in the person of the able and crafty George Podiebrad (1458–'71), the establishment of a hereditary national dynasty was prevented by the ambitious designs of Hungary's great monarch, Matthias Corvinus, and Bohemia now leaned on the power of the Polish Jagellons.

After the death of Matthias Corvinus, Hungary and Bohemia were for a time united under Jagellon kings. Then came the catastrophe of Mohács, the collapse of the Hungarian realm at the hands of Solyman the Magnificent. The Bohemians had to choose a king. They accepted Ferdinand of Hapsburg, a step portentous for the future of the Czech nationality. *Hinc prima mali labes.* The land of Huss welcomed the Reformation, and the power of Hapsburg crushed it out and with it the national existence. Nowhere did the Counter-Reformation do its work more thoroughly than in Bohemia. The Protestant uprising under Count Thurn, which initiated the Thirty Years' War and well-nigh overturned the Austrian throne, had as a consequence the conversion of Bohemia into a conquered province of the Hapsburgs and an absolute restoration to Catholicism. The Peace of Westphalia sealed the fate of Bohemia, and ever since that time the nation which a hundred years before Luther defied the power of the Church, and so heroically beat back the crusading chivalry of Germany, has been reposing quietly in the arms of Rome. And now, when the Czech thinks of the part he once played in history, he is beset by conflicting emotions. He cannot help reflecting how the glorious deeds of his race are bound up with those struggles against the Church to which he is so fondly wedded. Yet none the less strongly does his love of nationality assert itself.

"In that struggle between Teuton and Slav," observes Mr. Maurice in the work before us, "the one thing which, from the earliest to the latest times, has been the most prized treasure, and the subject of the fiercest championship of the Bohemian, is his language. . . . Hus is honored, even by Roman Catholic Bohemians, as the assertor and developer of their language."

The vigorous reawakening of national feeling among the Czechs in the latter years of the eighteenth century, and in the early part of the nineteenth, was mainly the work of the scholar and the writer. The people realized that they possessed a language for which it was worth while struggling, a tongue "one of the most varied and expressive of modern Europe." They realized as they had never done before their position as part of the great Slavic race, and they gave an emphatic utterance to this sentiment in 1848, when a Slavic congress was convened at Prague and the propaganda of Panslavism took tangible

shape. Unfortunately for the Czech, the great Slavic power which threatens the disruption of Austria and on which he might lean, is separated from him by the barrier of divergent religious belief.

The struggle for autonomy on the part of Bohemia constitutes at the present day the greatest of the internal perils which beset the Austrian ship of state. That the Germans of Cisleithania will yield, cannot be expected. They cannot for a moment contemplate the idea of the reconversion of Bohemia and Moravia into a Slavic kingdom and the handing over of millions of their people to the rule of a foreign race. While the Czechs are perhaps as far as ever from achieving their main object, the attainment of which would entail a fresh danger to the peace of Europe, their untiring agitation has wrought a great change in the status of their nationality. They can now point with pride to their national university at Prague, instituted by the Government of Cisleithania by the side of the old university, and rivalling in attendance the universities of Oxford and Leipzig.

We regret that the author whom we are reviewing should have confined himself within the limits indicated on the title-page. For an account of the stirring events of 1848 Mr. Maurice refers the reader to his 'Revolutions of 1848 and 1849,' which was reviewed at length in these columns. That work is inspired by an ardent sympathy with the peoples whose efforts to regain their autonomy formed part of that extraordinary upheaval. The volume before us is not a "story," but serious history. Mr. Maurice has not enrolled himself among the writers whose plan, as set forth in the prospectus of the "Story of the Nations," is to "enter into the real life of the peoples, and to bring them before the reader as they actually lived, labored, and struggled, —as they studied and wrote, and as they amused themselves." He is as far removed from this class of historians as possible. He deals only with events, and is entirely engrossed with the recital of the religious and political revolutions of a people whose tragic career has excited his sympathies, and which has been "strangely misunderstood by the average Englishman." The most appropriate place for the volume would be on the shelf by the side of Coxe's 'History of the House of Austria.'

Mr. Maurice has evidently devoted much study and labor to his task (much of his research having been done in the towns of Bohemia and Moravia), and he deals with his subject with such painstaking minuteness that his work becomes a chronicle through which only the student who is already somewhat of an historian will wade with entire satisfaction. Always intent on his main theme, the author refuses to drop the thread of his narrative in order to enable the reader to survey the field before him. Indeed, we have seldom seen an historical production in which the student is allowed to proceed so utterly without bearings. Mr. Maurice has apparently forgotten that an historical picture like the one he has so carefully drawn needs a framing to be properly appreciated. The kingdom of St. Wenceslas floats before our vision in a shoreless sea. The Holy Roman Empire, Austria, Poland, Hungary, Luxemburg, loom up only as phantoms on a vague horizon. The recital of the woes and throes of Bohemia can hardly be pronounced a grateful theme for the historian. There is little to fasten our gaze till we reach the epoch of the Luxemburg kings, and the brief periods of national greatness, if such they may be called, had each their sequel of depression and downfall. The part which Bohemia played in initiating the Thirty Years' War of course possesses most dramatic interest for the reader.

A temperate tone pervades this history. Mr. Maurice is not led to indulge in undue praise of the nationality whose cause he champions, or in denunciation of the race and rulers which it has had to serve. His narrative is plain and unadorned, the style unaffected and often forcible. He does not always show himself perfectly familiar with the facts of history when he has to tread beyond his immediate *terrain*. Thus, we are told on page 394 that many of the Bohemian Brotherhood "accepted the invitation of the Elector of Brandenburg to settle in his newly conquered province of Prussia." Now Prussia was not a "province," but a separate state, a duchy. It had not been "conquered" by the Elector of Brandenburg, nor was it under the sway of the Electors of Brandenburg at the time referred to; its ruler being a prince of the margraval line of Brandenburg-Ansbach, who had converted the realm of the Teutonic Knights, of which order he was grand-master, into a secular duchy. The Schmalkaldic League was not formed in 1542, as stated on page 388, but in 1530.

Mr. Maurice finds pleasure in making his readers acquainted with the names of Bohemian and Moravian places in their Slavic form, in spite of the fact that they generally "seem so unpronounceable." In many cases he couples the German and Bohemian forms, placing one in parenthesis. We think he has indulged his own predilection unwarrantably far (witness on page 395 *Loket*, in which who will recognize *Elbogen?*), and he merits the charge of inconsistency of which he expresses a fear in his preface. Thus, while on page 468 we find *Budweis* (*Budejóvice*) and *Pilsen* (*Plzen*), on page 470 the former of these towns is mentioned under its Czech and the latter under its German form. The Slavic names are printed throughout with their diacritical marks, to the great exhilaration of the Anglo-Saxon reader. It is a pity that the same attention has not everywhere been lavished upon names in strange tongues. Stephen Bocskay, the leader in the Hungarian rising of 1604, figures everywhere under the appellation of Bocksay. The introduction of such forms as Passauer (inhabitant of Passau) may be praiseworthy, but we cannot see why Mr. Maurice prefers to employ the same ending for the plural as for the singular. A strange slip or misprint occurs on page 374, where we read of the danger of Ferdinand's "election" to the throne of Spain.

The map of Bohemia and Moravia inserted at the back of the volume is defective in not giving the names of the important mountain ranges which enclose these regions. The name Lausitz (Lusatia) might advantageously have been introduced on this map. Of the numerous half-tone illustrations in this otherwise handsomely printed book, we can only say that most of them are beneath criticism.

GREEK FUNEREAL MONUMENTS.

Sculptured Tombs of Hellas. By Percy Gardner, Litt.D., Lincoln and Merton Professor of Classical Archæology and Art in the University of Oxford. With thirty plates and eighty-seven engravings in the text. Macmillan. 1897.

THIS beautiful book is welcome to all who believe in classical archæology as a study which may bring into prominence the humanitarian side of classical studies. It is equally serviceable for the general reader and for the scholar, since it deals competently with the whole subject in hand, without being voluminous. Of its 259 pages, nearly fifty are occupied by the engravings in the text, which are a wonderfully complete supplement to the thirty well-executed and selected full-page plates. Prof. Gardner has successfully studied a brevity which sacrifices nothing essential because it suppresses all labored descriptions of monuments, and depends upon adequate representations of the monuments themselves. In harmony with this truly artistic as well as time-saving plan is the practice adhered to of using rhymed metrical translations where the literary form of cited texts invites and permits such treatment. These translations are often very happy, although the advisability of using the ballad metre for extracts from Homer is perhaps open to question. Throughout the book our author has most aptly availed himself of the Palatine Anthology where excerpts from it show themselves applicable to this or that figured monument. This is often done with the most original effect, and the same thing is noticeable in the use made of actually inscribed epitaphs. By these appeals to poetry a literary flavor, never quite foreign to any class of Greek monuments, is made to enhance our appreciation of Greek sculptured tombs.

One consideration makes the subject of Greek funeral monuments of especial moment, and that is the importance of the fourth century B. C. in this particular branch of art. During the earlier, the great period of Athenian power, when the greatest splendor and perfection were achieved in larger concerns, the monuments of the dead were comparatively neglected. For this the reasons were no doubt many, and the parallel fact is worth noting that during the period of the great dramatists and historians such minor and intimately personal forms of literature as the epigram almost disappear. Therefore it is important to have before us a full treatment of that minor and more intimate aspect of Greek art which finds its fullest scope during a period which we are tempted to pass over with neglect. Certainly after the battle of Aegospotami, as our author says, "the conditions of sculpture at Athens underwent a great change," and "Art worked mainly in the service of individuals." This was a time when the sepulchral monuments at Athens became almost sumptuous, and such sculptors as Praxiteles, such painters as Nicias, undertook tombs. Two well-known sepulchral reliefs, that of Dexileos (Plate xii.) in the Ceramicus, and one found in the Ilissus (Plate xv.), are connected with the school of Scopas if not with Scopas himself. Indeed, Prof. Gardner, though decorously sceptical, does not visit with downright scorn the suggestion that the stele of Phænarete may be in commemoration of the mother of Socrates, the handiwork either of Socrates or of his father Sophroniscus.

In the days of Phidias, sculptors of renown had higher work to do, and thus there is perhaps only one funeral monument unmistakably suggestive of the style of Phidias—the wonderful "figure of a young man clad in a mantle, who holds in his left hand a bird, and extends the right without obvious purpose" (Plate xiv.). With this, however, can be roughly classed that "noble figure of an athletic ephebus" (Plate xiii.) found at Thespiæ, and

inscribed in Roman times with the name of Agathocles. Also here may be placed the stele of Tynnias, the son of Tynnon (Plate x.). Of this simple seated figure Prof. Gardner truly says: "The work is not very careful, yet it would not be easy to find in art a figure of greater grace and dignity. This mere mortal would sit undisgraced among the seated gods of the frieze of the Parthenon. He might almost stand for Zeus, the father of gods and men, instead of for the father of ordinary Athenian girls and boys." Indeed, just here we may discern the surviving religious hue of earlier sepulchral art, where it is so often quite impossible to say how far the sculptured representation stands for the man commemorated, and how far it shadows forth the netherworld divinity with whom death has united the departed soul. Of such earlier sculptured monuments our book contains not a few, and the account of these is especially interesting since it leads back to the general introductory chapter—based largely on Rohde's well-known book—dealing with beliefs as to a future life.

One of the fascinating mysteries still unsolved in Greek sculptured tombs and funeral representations of all kinds is the persistent conspicuousness of representations of the horse. A study of the plates and figures in those chapters of the present work (vi. and vii.) which deal with Spartan monuments and with "heroizing reliefs," reveals a constant tendency to introduce a representation of the horse. This is done so oddly as to suggest that the presence of this animal had the virtue of some sort of a charm or was in some way consecrated by ritual. Take, for instance, the stele from Chrysapha (fig. 30), on which a seated man holds a wine-cup in his extended right hand. Below the cup, leaping up towards his lap, is his dog. Nothing could be more normal or natural. But above the wine-cup, standing in mid-air, is a very diminutive horse. Nothing could be more formal or enigmatical. Dr. Furtwängler is quoted as giving a symbolical reference to both animals: the horse belongs to Hades, the dog to Hecate, both mythologically and ritually connected with the dead. Prof. Gardner has advocated the bolder view "that these animals sculptured on the stone bear the same relation to the mortal horse and dog which had belonged to the hero that the portrait bears to himself." This view seems satisfactory so far as the representation of the dog is concerned. Indeed, the representation of a favorite dog in various natural attitudes is one of the most charming of the commonplaces of Greek sculptured tombs. But the case of the horse is different. An uncanny prominence is given to him, either by "skying" him and making him disproportionately small, as in this stele from Chrysapha, or by bringing him full-sized into the centre of the sculptured scene, where he crowds the human figures into less conspicuous positions and seems to take possession of the altar pictured at the centre, as in a relief from Thebes now at Berlin (fig. 36 in the present book), or on two so-called "Marathonian" funeral vases in the Louvre, and on various monuments figured in Prof. Gardner's plates. Finally, still among heroizing reliefs, we have (fig. 39) the curious representation of a hero approached by a line of worshippers, while just in front of and above him appears the head of a horse thrust through a small window, as if to assert his lively interest in the ceremonial of hero-worship represented.

These and other striking details characterizing the horse as figured on funereal monuments have led Dr. Furtwängler and others to insist upon the connection between the horse and Hades. But, as Prof. Gardner points out, there is no really sufficient ground assigned for this connection. If, however, the late Mr. McLennan had lived to become cognizant of this archæological difficulty, there is no question that he would have seen in the mysterious prominence of the horse on many sculptured tombs and funereal representations an echo of primeval totem-worship. For, when he endeavored to indicate Greek records of the survival of totem clans, he pointed among other things to the astounding number of names and epithets of Homeric heroes which rung the changes upon the word ἵππος. Certainly the notion of a horse-totem is suggested not only by Homer, but also by many facts and fancies given by Pindar. If this totem-worship was merged into those forms of ancestor-worship which ultimately grouped themselves around the cult of netherworld Hades, then the mysterious prominence of the horse on Greek sculptured tombs would be easier to understand. Nor would this view at all exclude Prof. Gardner's simpler explanation "that a chief accustomed all his life to riding would scarcely be supposed to lack a horse in the field of Hades." This would not be the first time that a matter-of-fact explanation has accounted to people for their own persistence in a time-honored practice, the original motive for which had vanished far beyond their ken.

Our author's account of the sepulchral significance both of the sphinx and of the siren is most lucid, and he clearly points out how these borrowed figures became something entirely new, both outwardly and in their spiritual significance, the moment they entered Hellas. Athenian sentiment and taste could not finally appropriate the conception of the sirens as they appeared in Homeric legend. "The siren of Attic tombs," says our author, "has greatly modified her nature under the kindly influence of Attic poetry and art. She came from the East almost certainly as a malicious and devouring dæmon. But in the ordinary custom of Attic tombs of the fifth and fourth centuries she becomes friendly and sympathetic." This fixed the significance of the siren for later Greece, and among the terracotta figurines found in the burial-ground at Myrina, no figures are more full of the incommunicable thrill of beautified regretfulness than those magical forms and faces of sirens scattered in profusion through the soil which enshrouded the beloved dead. But the necropolis of Myrina contained no sculptured tombs, and belongs mainly to the Greco-Roman period, which is not touched by the book in hand.

To return, then, to our author, he certainly has not justified a dictum laid down in his preface, that the Attic literature of Greece belonged to a class, an aristocracy; for nothing is more happy or striking than the constant use he has made of the tragedians as well as of the Anthology in pointing the meaning of his sculptured records of Atheniam sorrow for the dead. Nor does it seem likely that he could defend in the long run quite such an extreme statement about Homer as that "It is really remarkable how nearly the Homeric theories of the soul correspond with the facts recorded by that cautious and sceptical body of inquirers, 'The Psychical Society.'" Even Rohde, who has chosen to draw his whole picture of Hellenic beliefs as to a future life without much regard to delicate shades of transition and with a sad neglect of half-lights, has said nothing quite so lurid as this in his account of the "rationalizing" drift of Homer.

There is another point made in Prof. Gardner's striking account of the monuments of Dexileos and Aristonautes commemorated because they died on the field of battle, but sculptured in the most lively attitudes of warfare, which seems open to question.

"An artist," he says, speaking of Dexileos, "such as those who have modelled the tombs of St. Paul's and Westminster, would probably have sculptured him smitten to death, falling back in the arms of a grateful country; perhaps would have added, above, an angel crowning him with a wreath of celestial reward. But the Greek artists of the good period could not find in defeat and death any elements worthy of their art; they must represent those whom they portrayed in the moment of success and victory, not in that of overthrow. The difference is very suggestive. Infinitely inferior to Greek art in charm, in simplicity and dignity, modern art introduces higher elements than were usually taken into account in Hellas. From the artistic point of view the ancients were right; but from the ethical point of view there may be more to be said for the moderns."

The one thing which it is impossible to allow is that such representations as those in Westminster and St. Paul's thus alluded to stand for modern art. Most emphatically we protest that in such funereal monstrosities no higher element than melodrama can possibly be said to be introduced. If such things can pass for modern art, it is high time to agitate for a purgation of the two places of state burial in London.

But we must not part save in amity from so truly delightful a book, and will close, after noting the fascinating chapter at the end on the Sidon sarcophagi, and the really unique account of the Mausoleum in chapter xiv., with Prof. Gardner's wonderfully happy summary of the nobility and dignity which exhale alike from the roughest and the most finished of Athenian sculptured tombs. "Like the maidens of the Parthenon frieze, all these human beings behave as if in the immediate presence of the gods. They embody nobility and repose." Indeed, Prof. Gardner has here answered his own heretical statement that the melodramatic vacuity of certain monuments in St. Paul's embodies a higher element, and better satisfies an ethical standard, than do the sculptured tombs of Hellas.

The Girlhood of Maria Josepha Holroyd [Lady Stanley of Alderley]. Recorded in Letters of a Hundred Years Ago: from 1776 to 1796. Edited by J. H. Adeane. Longmans, Green & Co. 1896.

THE pair of silhouettes which ornament the cover of this volume are an excellent introduction to its contents. Before the reader reaches the title-page he is reminded by a profile of Gibbon facing another profile of Lord Sheffield that the peer was the historian's most familiar friend, and that the name of Holroyd will always be remembered so long as men, prompted by admiration of the 'Decline and Fall,' are led on to explore its author's life. Gibbon is both directly and indirectly concerned in this bundle of family letters. His authority is invoked by the editor to vouch for the unusual parts of Maria Holroyd, and he appears *passim* in the correspondence which she conducted with her friends and relatives. Moreover, a visit paid to him by Lord Sheffield with his wife and daughters furnishes the central action of the piece. The party reached Lausanne via Paris, travelling through France just after Louis

XVI.'s attempted flight to General Bouillé and detention at Varennes. On the journey and in Lausanne they met several leading nobles with whom they were again thrown in at Coblenz when on their way home. Thus Gibbon is very much to the fore, both from his intimacy with the Holroyds and as being the indirect means of their intercourse with many of the *émigrés*. Lord Sheffield was able to return with interest the hospitality which had been shown him on the Continent, by entertaining his former hosts after the stress of Revolution had driven them to seek refuge in England. It is to her close acquaintance with politicians like the Prince de Poix, Malouet, and Lally-Tollendal that the letters of Miss Holroyd owe most of the historical importance which they possess.

The personal interest of this correspondence is considerable. Maria Holroyd was a precocious child who did not lose her brightness with the approach of early womanhood. Gibbon may be suspected of falling into the vein of eighteenth-century flattery when he praises her to her face, but one also observes that he uses the same expressions in writing to persons outside the Holroyd circle. Though Edridge's portrait does not make her out a beauty, it shows intelligence, and her letters supply evidence of the sprightliness with which a successful woman of fashion must be endowed. She was born in 1771 and married to Mr. J. T. Stanley, afterwards the first Lord Stanley of Alderley, in 1796. Her letters now published open with a few childish efforts and end with her marriage. They begin to be worth notice in 1791, the date of her first visit to the Continent, and illustrate her life with fulness from its twentieth to its twenty-fifth year. Thus they cover French politics from the end of the Constituent Assembly to the installation of the Directory, and with French politics they deal more than with any other one subject. They are addressed principally to the writer's aunt, Sarah Martha Holroyd, and to a member of the family at Sheffield Place, Miss Anne Firth. Answers are often included, so that the effect of a mutual rather than of a one-sided correspondence is preserved.

One of Miss Holroyd's strong points was that she hardly ever ventured into the field of political dissertation, where she would have been a failure, but contented herself with writing free and frank descriptions of what she saw and did. Her breeding must have been excellent, for she never ran into girlish ecstasies over her experiences and acquaintance, though both would have gone to a weak head. That she kept her eyes open is quite clear. Her narrative is circumstantial to a degree, and bears traces of depending for fact on jottings made at the moment. Her account of the Apotheosis of Voltaire reminds one of the modern reporter. We select a passage from it to show her minuteness and the quality of her style:

"Garlands of Roses, oak leaves, etc., were thrown on the figure of Mirabeau as it passed, and women, as well as men, clapped and bravoed enough to deafen anybody who had not the spirit of Democracy as perfect as themselves. Then a plan and model of the Bastille; pieces of the Bastille, cut into the form of and painted to look like books, and old pieces of armour and cannon balls which were found in the Bastille when it was taken and destroyed: flags were carried with sentences out of Voltaire's works in favor of Liberty; after these, a gilt figure of Voltaire, seated on a chair, was brought and placed before the House. . . . Then followed a Case with Voltaire's Works very richly bound; National Guards; Deputies from the Municipality, Theatres, and Académies de Musique et de Danse. Some of the Poissardes who distinguished themselves most in the famous Revolution, marched in the procession in a most ludicrous dress, perfectly amphibious, for they were neither man nor woman. They had a petticoat on, which gave one reason to suppose they were females, while the Coat and Epaulette appeared as much the contrary; but the best information I could get, said they were women. I really supposed they had been men in women's clothes."

These are only a few lines taken from four pages of compact detail.

For one whom birth and friendships threw into the aristocratic camp Miss Holroyd, writing from Paris, Strassburg, and Coblenz, is tolerably impartial. While she notes the harangues of Brissot and Pétion at the Jacobin Club, and the popularity of "Ça ira! Ça ira! les Aristocrates à la Lanterne!" she likewise notes the trouble caused at Strassburg by the singing of "O Richard! O mon Roi!" and the jealousies of the *émigrés* at Coblenz. She reached the last named place on her return from Lausanne in October of 1791, just after the league of Pillnitz had given the Comte d'Artois and his band great courage. The town was overflowing with French notabilities, and Lord Sheffield's party had to hunt for beds to sleep in with as much diligence as is now required in Lucerne during the month of August.

"After the Servants had inquired at every Inn in the town, and at many private Houses, we could only have one miserable room without a bit of Furniture, and only one Bed, without Curtains. This was just better than nothing, and we four women adjusted ourselves as well as we could on Mattresses upon the Ground; Mama occupying the bed, which broke down as soon as she got in. Papa slept in the boat, as there was no place for him to dress and undress in, the house was so full."

Lord Sheffield, however, had the *entrée*, and met every one, from the Elector and princes of the blood down to counts and field-marshals. Of all the French nobles subsequently received as honored guests at Sheffield Place Lally-Tollendal became most closely identified with the family. No one interested in his career can afford to neglect the information about him which is contained in Miss Holroyd's letters.

We shall say little about the Gibbon element in these pages. It is of almost equal volume with the element of French politics and will perhaps attract more readers. For present purposes it may be lightly dismissed, because it does not add anything of much moment to our knowledge of that imposing historian's character or surroundings. Miss Holroyd had a sincere affection for him and admired him too. She wondered why he could remain in Lausanne, "for there does not appear to me anybody with whom he can converse on equal terms, or who is worthy to hear him." Yet she does not seem to have appreciated the value of his life-work, for the words in which she adverts to his death fall wholly short of the occasion: "We have lost a true and sincere friend, indeed, and just now he is a particular loss to Papa. . . . There is no other person who has half the influence that poor man had. The best sense always guided by the best Judgment."

While one does not scrutinize private letters with a view to detecting errors of fact, we can say that Miss Holroyd's references to public affairs are more than usually accurate. She makes a mistake when she says of Count Rumford in 1796: "He has lived the last twenty years of his life at Munich, as Prime Minister to the Elector of Bavaria," and her authority for the statement that the snowy Alps of Bern are seventy miles distant from the Lake of Thun is somewhat shady. Addison, by the way, puts the same mountain chain in the Grisons. Miss Holroyd's utterances on subjects within her proper range bear the stamp of truth, and her letters deserve the dainty garb in which they are presented.

Higher Education in Russian, Austrian, and Prussian Poland. By Hermann Schoenfeld, Ph.D., Professor of Modern Languages and Continental History in the Columbian University, Washington, D C.: being Chap. xv. of the Report of the Commissioner of Education for 1894-95. Washington. 1896.

THE average person connects with the name of Poland that of Jan Sobieski, the partition of the country and its consequent disappearance from the sisterhood of European states. To a few it still preserves a semblance of national existence in the cultivation of a native literature, of which Sienkiewicz is almost the only known representative. But one can almost count on his fingers the names of those Americans who are acquainted with the fact that a renaissance of letters and of the national spirit has been in progress for the last quarter of a century in the dislocated members of the quondam Polish kingdom, which gives fair promise soon to rival, if not to surpass, its golden age in the sixteenth century. Poland is far from being dead, and at no time has the national hymn, "Jeszcze Polska nie zginela" (Poland is not yet lost), proved so prophetic as now. It is true, the regeneration of the country in a political sense is as yet a distant dream, but intellectually and morally it is all that can be desired. Under these circumstances, nothing could be more timely than a report on the higher education in Russian, Austrian, and Prussian Poland, the purpose of which is in a substantial manner, by dint of dates, facts, and figures, to bring before our eyes the feverish activity of this Slavic race.

After giving a general summary of the education and of the historical vicissitudes of the country, and a discussion of the prominent features of the language, the author passes on to the condition of Polish learning in the sixteenth century and the dissemination of the printing-press in Poland; then follows a succinct review of the higher education in the period of the Reformation, and finally a report on the state of higher learning at the present time. Mr. Schoenfeld does not profess to give an exhaustive treatise on the subject (this he promises in a larger volume), but only a general review, to form a chapter in the report of the Commissioner of Education. He has acquitted himself well of his task and deserves our commendation. There are, however, a number of minor matters that we should like to see improved in his larger work. For example, we should like to see him quote Morfill less and original sources more. Morfill, to be sure, has done creditable work in introducing Slavic literature to an English public, but as he himself draws almost exclusively on foreign (mainly Slavic) sources, we regret to see so many facts got at second hand. Under the chapter on Language we find some incorrect statements, showing an imperfect appreciation of linguistic facts. The statement that "the syllable with the vowel which has the tonic accent is long" occurs, indeed, in some grammars, but is entirely wrong; so, too, the

author has probably never heard the hard *l* pronounced in Polish, since he makes it "similar to *ll* in Spanish." A Russian philologist has described the sound as "liquida lateralis lingualis prior dorsalis postdentalis," which is both scientifically exact and æsthetically beautiful!

In matters of transliteration from Slavic languages no unanimity exists among English writers, some trying the impossible task of giving English phonetic equivalents for native sounds, others making a half-hearted attempt at exact etymological renderings of the original. When the English first became acquainted with Russia, in the sixteenth century, they transcribed the many foreign words as they heard them, and they succeeded in approaching tolerably near the native pronunciation. In the eighteenth century the French set the precedent for writing Russian with French equivalents, and now we generally get an unhappy blending of these two methods with the etymological system; but from this nothing but chaos can result. In popular literature not much can be done to remove this awkwardness, but in scientific or generally serious literature, in bibliographies and catalogues, nothing but the etymological method ought to be attempted—*i. e.*, those Slavic languages which already use a Latin alphabet must be left in the form in which we find them, with the diacritical marks, if available, placed over or under the letters. The Slavic languages that use the Cyrillic alphabet (Russian, Ruthenian, Serbian, Bulgarian) possess very convenient Latin correspondents, such as we find in the Croatian, which is hardly anything else than Serbian written with Roman type. This system is universally used by philologists (especially in the *Archiv f. Sl. Ph.*), and is as good as can be desired. In Mr. Schoenfeld's report there is no consistency in this matter: on p. 767 we find the scientific transliteration, elsewhere a phonetic form, and in the word *varshawskago* on p. 750 not less than three methods are combined in one.

A similar diversity exists in the use of the word Slavic, for which our author, and with him many others, uses somewhat indiscriminately Slavic, Slavonic, Slavonian. This multiplicity arises from the fact that no two Slavic nations use the same generic word. Only so much is certain—the stem of all such words is connected with *slovo*, and means, as now accepted by philologists, 'the people endowed with speech,' just as the Slavs call foreigners, particularly Germans, *Němec*, mute, *i. e.*, "barbaroi." Unfortunately, Mr. Schoenfield brings forward the antiquated etymology from *slava*, 'glory,' making the Slavs 'the glorious people.' Extreme Panslavists alone now cherish this derivation. The chaos is still further increased by the many names, with *slav*, *slov* for their stem, borne by a large number of local subdivisions. The Russians of the Middle Ages called the Novgorodians Slovenians; Slavonia is a (Croatian) province of Austria; Slovenians are collectively the Slavs of Carniola, Carinthia, Styria; the Slovak is a dialect, with an independent literature, of Bohemian. In view of all this, philologists and other scholars in Germany and France long ago appropriated the shorter form Slav and Slavic (*slavisch*) for the generic name of the whole family, leaving Slavonian and Slavonic as derivatives from Slavonia. There is no reason why English and American writers should not follow this excellent precedent. The confusion in the report will be seen from the following quotation: "(Polish) surpasses in importance and scope all the other *Slavonic* literatures taken together—*i. e.*, Bohemian, Servian, Croatian, *Slavonian*, Russian, Bulgarian" (p. 714). Does the author mean Slovenian or Old-Church-Slavic by Slavonian? In another place he speaks of *Panslavic* grammar as taught in the University of Warsaw (p. 756). In justice to that institution be it said that no such absurdity is attempted there. Krizanic's 'Panslavic Language' has long since been abandoned by all who make pretence at Slavic scholarship. The author has merely wrongly interpreted the word "obsceslavjanskij," which he found in the catalogue, and which means 'comparative Slavic,' or, rather, *Urslavisch*.

We hope all these defects will be eliminated in the author's larger work.

Thomas of Monmouth's Life and Miracles of St. William of Norwich. Edited by Augustus Jessopp, D.D., and Montague Rhodes James, Litt.D. Cambridge, Eng.: University Press; New York: Macmillan. 1896.

One of the most repulsive features of Jewish persecution by Christians is the ascription to Jews of the practice of immolating Christians in the performance of secret and hideous rites. Belief in this has existed for ages and is as yet by no means extinct. It has no authoritative warrant, for when Gregory XIII., in 1581, in his atrocious bull against the Jews, enumerated the offences which subjected them to the jurisdiction of the Inquisition, he made no mention of this, although he specified a custom ascribed to them of attaching a lamb to a cross and spitting on it, or otherwise insulting it, in derision of the crucifixion. Still the belief continues to exist and is made the basis of persecution, though not to the extent of the massacres for which, during the Middle Ages, it sometimes served as an excuse. In 1817 the Russian Government was obliged to issue a ukase to put an end to frequent prosecutions brought against Jews for such alleged offences in Russian Poland, and in 1840 a firman from the Sultan was rendered necessary in consequence of the torturing to death of prominent Jews of Damascus in the effort to obtain confessions arising from the disappearance of a priest named Thomaso—proceedings in which the French consul took an active and sinister part. As lately as 1892 the *Kreutz-Zeitung* deplored the miscarriage of justice in the failure to convict a Jewish butcher, named Buschoff, of Xanten near Düsseldorf, accused of murdering a Christian boy, and the *Germania* asserted that such sanguinary rites are encouraged in the Talmud, in spite of the notorious fact that rabbinical Judaism is especially scrupulous in the matter of bloodshed.

In view of these well-known scruples, ingenuity has been taxed to devise some explanation of the assumed propensity to offer up a Christian as a sacrifice during the Passover celebration. It has been gravely asserted that a Jewess in labor could not bring forth without being anointed with Christian blood which was thus procured. This would require such a constant succession of victims that a more plausible reason was found in the allegation that on Easter-day all Jews were afflicted with a bloody flux, for which Christian blood was the only remedy. In the book before us (p. 93) we find an earlier and a less prosaic explanation. Theobald, a converted Jew, informed his gaping fellow-monks of Norwich that, in accordance with old tradition, the annual sacrifice of a Christian child, in parody of the crucifixion, would eventually restore to the promised land the Jews of the Diaspora. Every year the leading rabbis assembled in Narbonne and determined by lot the country in which the offering was to be made; then in that land the town which was to perform it was selected in the same manner. In 1144, by this process, Norwich was chosen, and the result was the murder of the boy named William who figures in hagiography as St. William of Norwich, with his feast-day on March 25.

To all students interested in the growth of legends and fables the work which Doctors Jessopp and James have laid before us will be found indispensable. The martyrdom in question is the earliest recorded case of the kind, though it is by no means likely that such a belief could have assumed a shape so definite and complete as we find it here without having had predecessors. Hitherto the story has been known only through more or less imperfect narratives derived from the contemporary account by William of Monmouth. The fortunate discovery of a MS. of this work has enabled the editors to give it in full with all the necessary apparatus—a translation and an introduction in which everything that antiquarian learning and research can bring to bear is utilized to enable us to realize the environment in which occurred the martyrdom of the boy-saint, with such side-lights as serve to elucidate the probabilities of the story. Photographs, also, are given of all surviving representations of St. William to be found on the screens of churches at the present day.

The interest of the work, moreover, is by no means confined to the question of the blood-ritual, for we gain a very perfect view of the process of the manufacture of saints. Why a child who had been supposedly entrapped and murdered by Jews should become at once a saintly martyr, any more than one who met death by violence in any other form, is a problem in superstition not easily solved; but the example set in this instance was repeatedly followed during the Middle Ages, and was ratified by the Holy See in the case of St. Simeon of Trent, crucified in 1472. We here see how the holiness of St. William began to show itself in visions and miracles; how Prior Elias of the Benedictine house where he was buried refused to countenance the belief, and resisted the efforts of Bishop William Turbe of Norwich, who was determined to have it recognized, and how, after the death of Elias in 1149, his successor was more pliable, after which miracles multiplied and the cult became established. A new and vigorous saint of unquestioned thaumaturgic power was a valuable acquisition, for the oblations of pilgrims and the ex-votos of the sick were a source of reliable revenue, and all churches and religious houses were apt to be on the lookout for such means of increasing their income. The invention of miracles was merely a pious fraud, which did not even require imagination, for Gregory the Great and Gregory of Tours were always at hand to supply models from which to borrow. A large part of William of Monmouth's work consists of a recital of these marvels, and Dr. Jessopp points out a number which are evidently derived from older sources. Puerile as many of these may seem to us, they throw much incidental light on the manners and customs and beliefs of an age of which our knowledge is imperfect.

Grover Cleveland. By James Lowry Whittle. With two portraits. London and New York: Frederick Warne & Co.

THIS sketch, by an Englishman, was written before the Presidential election of last year. It is, the author says, a study of "Mr. Cleveland's attempt to apply the original teaching of Jefferson and his followers to the Republic of to day." Brought within a small compass, and told with considerable skill, the story is very different from the dreary record some readers might expect from this definition. It is full of the most dramatic interest, for it gives us the picture of a great struggle by a political leader of courage, strong will, and individuality against malevolent intrigue and persistent corruption, ignorance, and prejudice embodied in the Government of which he is the head. The book is not likely to be passed over, for Cleveland's vigorous character invests the narrative with the sort of interest that "politics" never gave to anything, and this although it relates only to his public career. Of the man in private station we get no sort of glimpse. His tastes, friendships, interests, whims, passions, enthusiasms, or vanities are as if they were not, and this although he has lived both in New York and in Washington, and though the inquisitiveness of the press has never willingly respected his privacy. We see him here solely in his relation to the people whose rights he has protected, solely as the trustee of the greatest elective political trust in the world, battling with fraud and wrong, and proclaiming his unalterable loyalty to the immortal principles which underlie free government.

So far as domestic politics goes, the author's view of Cleveland would not differ much from that held by the mass of his supporters (his constant popular majorities have been one of the most marked features of his career). The fact that the great danger to popular institutions with us (is it not so everywhere?) lies in the tendency of private interests to absorb the functions of government, is brought out with a good deal of force, and in Cleveland's mouth "Public office is a public trust" becomes a battle-cry, while his state papers on economical questions take rank as the work of a true statesman. When he summoned the country to attack the tariff in 1887, not a politician but deplored his indiscretion; in 1892 tariff reform swept the country. In 1895 he declared that the greenbacks must be retired, and in 1897 we are about to witness the appointment of a Secretary of the Treasury pledged to this policy by the party which is responsible for having kept the greenbacks afloat.

In foreign affairs the author has a more difficult task, for even a eulogist cannot make out that Mr. Cleveland's foreign policy has been consistent. A fair enough account is given of the Keiley and Murchison incidents, of the President's policy as regards the Sandwich Islands and Cuba, and of the fisheries and Venezuela imbroglios; but Mr. Whittle fails to mention the withdrawal of the Frelinghuysen-Zavala treaty, which was important as showing a sane view of the canal question.

The evident haste with which the book has been compiled has marred its accuracy, and consequently its effectiveness. Mr. Cleveland was not "at the head of his profession" when he became a candidate for high office (p. 8). If Mrs. Cleveland was born in 1864, she cannot be said to have been "not yet twenty" in 1886 (pp. 85-86.) The statement on p. 75 that in his dealings with foreign governments the President has "hardly an even share of power" with the Foreign Affairs Committee of the Senate, will hardly be assented to by any one who remembers that he is in daily and, if necessary, hourly communication with them, while the Senate has no direct communication with these governments and generally acts in reference to foreign affairs only on the President's motion. That "Baby Cleveland" was a popular cry in the election of 1892 (p. 87), we deny; nor are we willing to admit that the picture of the American view of the relation of the United States to the rest of the world given at p. 219 is a true description of the real public opinion of to day. If it were, our case would be hopeless, for to be American would mean to be silly. Cleveland himself is an American of the Americans.

Classes and Masses. By W. H. Mallock. Macmillan Co. 1896.

WHAT Mr. Mallock has undertaken in this little book is what must be continually undertaken in every country where government by the people prevails. In every such country there will always be found demagogues whose energies will be devoted to stirring up discontent with existing institutions. They will proclaim, as Mr. Mallock says, that society as now organized is essentially unjust; that its "tendency is to confine the benefits of progress more and more strictly to the few, and to push down the masses of the people into ever deepening poverty and servitude, rendering their chances of making even a bare living more and more uncertain." The proper way to deal with such complaints is not to meet them with ridicule and denunciation, but to investigate them; to ascertain by scientific inquiry whether they have any basis or not If it appears that they have a substantial basis, then the demagogues were right in endeavoring to effect changes. If it can be shown that they have no basis, then the demagogues were wrong, and we must trust to the intelligence of the community to repudiate them.

We should very quickly exhaust our space were we to attempt to state the results of Mr. Mallock's investigation. He has prepared a perfect magazine of arguments ready for use by public speakers or by any one who has occasion to refute popular fallacies; but as his facts are drawn from English sources, they are only indirectly serviceable in this country. The inferences from them, however, are so unavoidable and so far-reaching as to establish a presumption that they are true outside of Great Britain. The condition of the poor may have improved more in that country than in others; but the fact that it has so greatly improved there—under the blighting influence of gold monometallism, it may be remarked in passing—proves that the present constitution of society is not necessarily evil.

So far as actual pauperism is concerned, Mr. Mallock shows that in proportion to population it has declined one-half within the period of a generation. The middle class—those having incomes between £150 and £1,000—increased between 1850 and 1880 from 330,000 to 990,000. The rich—those having incomes over £1,000—have not increased so rapidly, and with the exception of a few hundred persons their average wealth has not increased so much as that of the middle class. Since 1880 it is notorious that the great incomes from land have been cut down; and if the total income of the millionaires were divided among the people, it would be for each individual only a shilling a month. As to the working people, their numbers have relatively decreased because so many of them have risen into the middle class, but their income has grown enormously. It amounted in 1860 to as much as the income of all classes in 1800; it amounted in 1880 to as much as the income of all classes in 1850. During the century, average wages have also considerably more than doubled. As to the "idle rich," Mr. Mallock demonstrates that the proportion of unoccupied male adults is as one to sixty, and he contends that the ground rents of the whole country do not exceed a hundred million pounds—sixty millions less than the Socialists claim.

We do not vouch for the correctness of all Mr. Mallock's calculations, although we are satisfied that many of them are unexceptionable. But his book is to be commended to American readers as an illustration of methods of dealing with social discontent which we shall probably have to employ. Its weak point, as in most such efforts, is its employment of possibly defective and misleading statistics; and it is much to be desired that no one who shall attempt similar work in this country will be satisfied without the most conscientious verification of the figures furnished either by Government or by private enterprise.

The Silva of North America. By Charles Sprague Sargent. Vol. X. Liliaceæ to Coniferæ. Boston: Houghton, Mifflin & Co. 1896.

THIS tenth volume of the 'Silva' gives forty-one more of the French reproductions of Mr. Faxon's beautiful plates. For the most part, the French artists have been successful, and with few exceptions have preserved the life-like character which Mr. Faxon has the gift of imparting to his figures. In some of the present plates there is noticeable a tendency to deepen the shadows beyond their true value, but, while this impairs the general effect, it does not touch the accuracy of the outlines. The remarkable steadiness with which Mr. Faxon has adhered to the high ideal with which he started in his illustration of the 'Silva,' gives to these plates, which now pass the five-hundred mark, the same value that the first possessed; their fidelity and artistic feeling are of the highest order. The analyses are well done and heighten the value of each demonstration. In questions which may later arise as to determinations, there can be no doubt as to the originals which Mr. Faxon had in hand.

The text is excellent. Some of the specific differentiations would be, without the accompanying plates, rather obscure, but, with the figures, present few features which would be likely to lead astray. The general descriptions of species are attractive and telling. And in all cases the general accounts of biological and economic aspects are interesting, especially when read in connection with the copious notes and references.

The range of the tenth volume carries the reader beyond the great group of Dicotyledons, extending from magnolias to willows, with which its nine predecessors had to do, and we begin here with the Monocotyledons. These two great groups of plants are distinguished in many ways. Between them, in the system of classification generally followed in this country hitherto, it has been customary to place the Gymnosperms. But of late years it has been shown beyond reasonable doubt that the Gymnosperms are very closely allied

to the more highly developed relatives of the ferns, and are therefore in the system of classification to be placed near them instead of between the two great groups of flowering plants above referred to. Prof. Sargent has wisely adopted this course.

The Monocotyledons, to which lilies, grasses, and the like belong, do not possess very many arborescent forms. Only two orders of these fall within our geographical limits. The order Liliaceæ contributes eight species, all of yucca. These are the Spanish bayonets and their kin, some of them having a noble or at least striking port. Of palms, the other order within the limits, there are seven species. One of the species of palms fitly commemorates the name of the author of the 'Silva.'

After the Monocotyledons come the Gymnosperms, for it must be remembered that the sequence in this work is from the plants assumed to be highest down to the lower. In the present volume only a few of the Gymnosperms are discussed. These are the Torreyas, junipers, cedars, and their near relatives; the vast group of pines is to find a place in subsequent volumes. The pines will bring this valuable work to a close.

The Yoke of Empire. Sketches of the Queen's Prime Ministers. By Reginald Brett. [With portraits.] Macmillan. 1896.

THIS is an elegant little volume, in which, the preface tells us, "the writer has endeavored to illustrate a single point—the human relation between a constitutional sovereign and her ministers." It is a sufficiently readable account of five of these remarkable men, Lord Melbourne, Sir Robert Peel, Lord Palmerston, Lord Beaconsfield, and Mr. Gladstone, while the period from 1846 to 1861, when Lord John Russell, Lord Derby, Lord Aberdeen, and Lord Palmerston held the Treasury for longer or shorter periods, is not improperly thrown into a single chapter, under the name of Prince Albert as "Permanent Minister." The writer does not disguise his opinion that Sir Robert Peel occupies much the highest position, whether for talents or character, among these leaders; and such is not unlikely to be the verdict of history. Mr. Brett is remarkably gentle, almost affectionate, towards Lord Melbourne as the Queen's instructor in her duties, and, though severe, hardly unjust to Lord Derby, as too flighty for his high position. He is generally fair to Russell, but he omits to bring out that his ministry was bound to be unsuccessful because the offices were blocked with a flood of Greys and Elliots, appointed out of an exaggerated regard for Russell's former chief and his own wife. The story of how the Queen gradually got over her dislike to Palmerston, Gladstone, and Disraeli is well told, though Mr. Brett hardly makes clear—perhaps he dared not—that such liberality and openness of disposition was much more possible to Victoria herself than to her somewhat narrow, if high-minded, husband.

There are some blots in the book. To say Peel was "ostracised" from political office is thorough journalistic jargon; his position in Parliament was as far from the exile of Aristides or Thucydides as well could be. To call Victoria at eighteen a "child-queen" (p. 4) is ridiculous; and so is it to speak of her husband as a "lad of twenty-two" (p. 39) and a "boy of six and twenty" (p. 70). The American minister in 1838 was not named Stephenson (p. 19). According to the 'Annual Register' for 1837, it was not Lord Conyngham but Lord Albemarle who accompanied the Archbishop in conveying to the Queen the news of her accession (p. 3)—if it is of any consequence.

BOOKS OF THE WEEK.

Autobiography of Charles Force Deems, D.D., and Memoir by his Sons. F. H. Revell Co. $1.50.
Bailey, L. H. The Forcing-Book. Macmillan. $1.
Bartholomew, J. G. The Pocket Atlas of the World. 10th ed. Putnams. $1.25.

"A very interesting book and a very amusing one."—The Dial.

ANIMAL SYMBOLISM IN ECCLESIASTICAL ARCHITECTURE.

By E. P. EVANS. With a Bibliography and 78 Illustrations. 12mo, buckram, $2.00 *net.*

Ex-Prest. A. D. White of Cornell, in Appleton's Popular Science Monthly: "Many a ponderous and voluminous work on mediæval history and art, requiring months for its study, is really far less valuable than this little book."

Book Buyer: "Crowded with knowledge, the book is yet as entertaining as a fairy tale."

Reginald Hughes, in the Academy: "A perfect treasure-house of information. . . . Written in a spirited and vivacious style. . . . His work is extremely well done."

Dr. Borinski of Munich University, in the Allgemeinezeitung: "An instructive and interesting book."

Die Nation: "Written in a condensed but very pleasing style. . . . Of works of this class there is hardly one that deserves to be so highly recommended."

CUBA AND THE CUBANS.

BY
RAIMUNDO CABRERA,
Member of the Executive Committee of the Cuban Autonomist Party, Ex-Provincial Deputy, etc.
Author of "Los Estados Unidos," etc.

A useful and timely book.—*The Nation.*
The volume is well edited.—*N. Y. World.*
We wish this valuable work the fullest success.—*N. Y. Staats-Zeitung.*
Not a philippic, but a sober, well-considered historical writing.—*Phila. Evening Telegraph.*
The book is full of value for its facts.—*Chicago Inter Ocean.*

442 pages, 12mo. 124 Illustrations and a map.
For Sale by all Booksellers. Price, $1.50.

YALE MIXTURE.

The choicest tobacco made, and preëminently a gentleman's smoke.

Marburg Bros., The American Tobacco Co., Successor, Baltimore, Md.

HATCHARDS.

This is the favorite BOOKSTORE, and for 100 years the resort of the smartest people in London. It is visited and patronized by all who love books. London is the great market for books, and all the best as well as the cheapest editions can be had by writing here. Special collections formed, and fuller information supplied than from any other house. Books, both old and new, and relating to any subject, can readily be supplied, at very moderate prices.

Agents for Clubs, Libraries, and all private collectors.

187 PICCADILLY, LONDON, W.

Letters of Credit. We buy and sell bills of exchange on and make Cable Transfers of money to Europe, Australia, and South Africa; also make collections and issue Commercial and Travellers' Credits, available in all parts of the world.

BROWN BROTHERS & CO.
NO. 59 WALL STREET, NEW YORK.

SEND IN YOUR NAME AT ONCE to the Readers' Co-operative League, Box 223, Brooklyn, N. Y., if you wish to receive Free Specimen Copies of all the leading periodicals of the United States. Also send the names of your friends *who are readers.* Enclose stamp for reply, giving plan.

English Books. JUST OUT: February Clearance Catalogue of Standard English Sets, in fine bindings, at very low prices. Also, London Weekly Report of Rare English Works for collectors. *Send for both.*

The Nation.

NEW YORK, THURSDAY, MARCH 4, 1897.

The Week.

MR. CLEVELAND'S parting veto—of the Immigration bill, namely—is not the least of the services he has rendered his country. He does not exhaust the list of objections to a measure which was doubtless favored and actively promoted by many well-meaning citizens out of Congress, but which was most ostentatiously urged and defended within that body by Jingoes, protectionists, and labor demagogues, and which even so passed the Senate by a bare majority of three. The President clearly enough sets forth the contrast between the policy here attempted and that which has been observed by this country, except in the case of the Chinese, hitherto, in welcoming all sound-bodied, industrious immigrants from any quarter, and shows how loosely the bill was drawn, what uncertainty and hardship and inhumanity its execution would entail, and what an irritating effect it would have on our immediate neighbors particularly, by its provisions regarding crossing the border in search of temporary employment.

President Cleveland's proclamations adding many vast tracts to the national forest-preserves mark the completion of a great work of enduring value to the country which has been done in the right way. Some years ago Congress authorized the Executive to withdraw from public sale parts of the forested public lands, and during the Harrison administration about 18,000,000 acres were thus set apart, to which are now added about 21,000,000 acres more. There was no "politics" in the business from first to last. The selection of lands, instead of being intrusted to office-seekers whose claims could not be otherwise met, was committed to a board of experts appointed by the National Academy of Sciences, with Prof. Sargent of Harvard as President and other men of equal fitness as his associates. For many years past, clear-sighted men have pointed out that the reckless cutting of timber in the far West threatened irreparable harm to the interests of that section, and so of the whole nation; but the danger was that, as there was "nothing in it" for the politicians, the movement for forest preservation might fail, especially as selfish interests were bitterly opposed to the reform. That in the face of these obstacles it has been achieved, is cause for national congratulation.

The Treasury statement for February invites comparison with the corresponding statement for February, 1893. Of course, we all know that President Harrison turned over the Treasury in a glorious condition, and we know that President Cleveland has emptied it and is now maliciously smiling as he hands over nothing but debt and deficit to his successor. We know this because several reputable stump-speakers and a multitude of veracious newspapers have so asserted. But it may be just as well to ask what the official figures say. They may be lying, but what they say is that the total available funds in the Treasury at the end of February, 1893, amounted to $146,812,418; the corresponding sum now is $212,837,255. Then the gold in excess of certificates reached $103,000,000; now it is $147,000,000. The available cash balance above the gold reserve was then $49,000,000—practically, counting out unavailable fractional coin and the fund for the redemption of national banknotes, less than $30,000,000. Now it is $112,000,000. But then we were tremendously prosperous, and now we are ruined, and all on account of the condition of the Treasury. The figures confirming the paradox it is just as well to put on record for the future use of students of national ruin, its symptoms and its causes, its *Werden* and its *Wesen*, as the German philosophers say. It is true we have borrowed $290,000,000 in three years, but every dollar of this borrowing was necessitated by laws passed during the Harrison administration.

The final report of the Venezuelan Commission expresses no opinion on the question where the "true divisional line" between British Guiana and Venezuela lies. Such opinion, even if the Commissioners had formed one, would be inappropriate after another tribunal has been provided for, expressly to decide that point. The work done by the Commission, however, will expedite the task of the arbitrators by many months, and will probably make both the parties more easily satisfied with the finding. We need not ask ourselves what would have been the result if the Commission had reported what they deemed the true divisional line, and one or the other of the countries interested had refused to accept it. Fortunately, all the possibilities hinging on that eventuality have sunk below the horizon. We have no troubles with Great Britain to face, although some of the belligerents of the Senate are groping to find one in the Bering Sea question. Senator Pettigrew insists that England ought to show more interest in suppressing pelagic sealing. Senator Morgan, the indefatigable searcher for foreign grievances, says that the anger and jealousy of Great Britain were excited when we acquired Alaska, and that immediately the Canadian raiders were turned into Bering Sea, who destroyed 400,000 seals the first year. Morgan knows all about it because he was a member of the Paris arbitration commission, and he knows that one of our contentions was, and is, that the bulk of these Canadian raiders were American ship-owners who got themselves registered in British Columbia in order to secure British protection. Pettigrew suggested the killing of all the seals when they come to the breeding islands, in order to prevent the Canadian raiders from killing them in the water. There is one manifest disadvantage about this plan, and we wonder that Morgan did not mention it. If the seals were annihilated there would be one less bone of contention and one less foreign complication to rant over and distress the business community with.

Congressman Grosvenor of Ohio took occasion last week to vent once more his disgust at civil-service reform and the existing merit system (which he characterized as "a sinuous, infamous conspiracy upon the Government"), and his confidence that "there is a tide rising in this country which will sweep this bureaucracy from power." A Democratic member from Texas attempted to attach importance to Grosvenor's remarks, "because of his well-known relations to the incoming President"; but the Ohio Congressman was constrained to admit that "the first bitter controversy he [Grosvenor] had had as a member upon the floor, was with that distinguished gentleman, then a colleague from the State of Ohio, upon what is called the merit system." It is worth while to recall this controversy, which occurred in the House on the 24th of April, 1890. Mr. Houk, a Republican member from Tennessee, while the legislative, executive, and judicial appropriation bill was under consideration, moved to strike out the entire section making provision for the expenses of the Civil-Service Commission, on the ground that it was "an impracticable machine," and that "the system was inconsistent with the genius and spirit of our institutions." Grosvenor supported this motion, asserting that "this law does not operate as a reform of the civil service of the country," and repeating the familiar falsehood that, "under the ægis of this system, under its protecting influence, there are a large number of utterly incompetent clerks in the public offices of this country, held there by the fundamental, underlying principle of this system and this practice which we are assailing."

After various spoilsmen had had their say, Mr. McKinley, who was then chairman of the ways and means committee, and so "leader of the House," closed the

debate in a brief but telling speech, which was followed by the rejection of the motion to starve out the Commission, 128 to 61. Mr. McKinley began by saying that his only regret was that the committee on appropriations had not given the Commission all that it asked, for the improvement and extension of the system, and proceeded to declare that, "if the Republican party of this country is pledged to any one thing more than another, it is to the maintenance of the civil-service law and its efficient execution; not only that, but to its enlargement and its further application to the public service." In last week's debate Grosvenor spoke of "Pendleton and the Democratic party having perfected this patent-medicine system." Something of the sort was said in the discussion seven years ago, and Mr. McKinley pointed out that the law was put upon the statute-book by Republican votes, and that every national platform of the party since its enactment had declared not only in favor of its continuance in full vigor, but in favor of its enlargement so as to apply more generally to the public service. He maintained that "this is not alone the declaration and purpose of the Republican party, but it is in accordance with its highest and best sentiment—aye, more, it is sustained by the best sentiment of the whole country, Republican and Democratic alike"; and he concluded with these emphatic remarks:

"Mr. Chairman, the Republican party must take no backward step. The merit system is here, and it is here to stay; and we may just as well understand and accept it now, and give our attention to correcting the abuses, if any exist, and improving the law wherever it can be done to the advantage of the public service."

If Mr. McKinley the Congressman felt in this way about the matter in 1890, we may be sure that Mr. McKinley the President will feel far more strongly in 1897, when he has been nearly killed by the onset of spoilsmen before he reached the White House.

If those Republican Senators who voted a few days ago for Chandler's international conference bill had any idea that it was possible to patch up a compromise with the silverites, all such notions must have been dispelled by the manifesto put out by Teller, Dubois, and the other seceders who supported Bryan last year. They say that for years events "have been forcing upon the country, with ever-increasing definiteness and emphasis, the necessity of reform in our monetary system as respects both the coinage of metallic money and the regulation and control of credit currency." They say further that they cannot follow those who have "usurped the dominion of the party into a shameless abandonment of American interests and the tyranny of an alien money system." The grammar of this deliverance is dubious, but its meaning is not. It signifies that the silver men will have no part nor lot with the Republican party hereafter, and that all efforts made to conciliate them will be completely thrown away. There never was any reason to imagine anything different. When Teller, Dubois & Co. took themselves out of the national Republican convention, and gave their support to Bryan, and brought to him the electoral votes of all the silver-mining States, they proclaimed in the loudest possible tones that they would have nothing short of free coinage at 16 to 1. They have now added to their programme, it seems, "the regulation and control of the credit currency," whatever that may mean. That it means further deterioration of the currency may be inferred from the company they keep. All experience shows that one downhill step leads to another. The real leaders of the movement to depreciate the money standard are the Populists, and it will be simply impossible for Teller and his followers to resist the next step toward the Ocala platform if they ever succeed in getting the metallic dollar shaved down to the minimum corresponding to their present desires.

Shortly before the meeting of the Indianapolis Conference, the nucleus of an organization called the National Sound-Money League was started in New York and Chicago simultaneously. In Chicago an organization of nearly the same character had existed during the political campaign, called the Honest-Money League, which had contributed much to the defeat of the Bryan ticket in Illinois and the adjoining States. After the election, the leading members of the League, which had only a temporary and local character, decided to unite with men of similar aims in other parts of the country to form a permanent working force to carry on the fight for the gold standard so successfully begun in the campaign. A similar group of men was brought together in New York at the same time, all of whom coöperated with, and some of whom were delegates to, the Indianapolis Conference. After the adjournment of the Conference the work of extending the organization was taken up and vigorously pushed, Mr. E. V. Smalley of St. Paul, Minn., taking the laboring oar as secretary and missionary-in-chief. It is worth mention that Mr. L. J. Gage was one of the Chicago members until he was designated for the office of Secretary of the Treasury. Some of the results of this movement were made manifest by the meeting last week at the Chamber of Commerce, where delegates came together from many distant States, including North Dakota and the State of Washington, to perfect the organization. The meeting was fortunate also in having the coöperation of Congressman Fowler of New Jersey, who has gained a wide reputation as an indefatigable worker and agitator for the gold standard and currency reform. Mr. Carl Schurz, Mr. Edward Atkinson, Mr. George E. Leighton of St. Louis, and other sound-money veterans were present and took an active part in the proceedings. Mr. Leighton was elected President of the organization, and Mr. A. B. Hepburn Treasurer, Mr. Smalley continuing as Secretary. Those who have kept close watch of the sound-money fight since it became definite and pronounced, will agree that no better selections could have been made.

The capabilities of 450 men chosen by universal suffrage and the boss system to decide important business questions are freshly illustrated by the failure of either house of Congress to pass any bill in reference to the Pacific Railroad subsidy debt. This question has been before Congress fifteen years. The Government has had five members of the board of directors of the Union Pacific, who have not been idle. They have presented this question to Congress from year to year, and have made recommendations with great regularity. There has been one investigation by a commission not composed of Congressmen, and the amount of testimony they took was appalling. There have been special investigations by committees of Congress itself and reports without number, and yet, whenever a definite measure has been brought forward, it has been voted down after a battle over the burial-place of the Crédit Mobilier and the members thereof. The last bill—the last one possible before foreclosure—met no better fate than its predecessors. Nor is there the least reason to hope for better results in the next Congress if the foreclosure suit could be postponed. Considering the ineptitude and helplessness of Congress in dealing with the question, the offer of the syndicate to pay about $47,000,000 to the Government for its second lien was extremely liberal and a great streak of luck. We do not say that anybody was particularly to blame for the failure of Congress to do anything. The case simply proves again that 450 men elected by ballot are not qualified to conduct large business transactions. What would have happened if the proposition that the Government should take the roads and operate them had been adopted?

It is reported that Gov. Black has been consulting with various persons, including several well-known advocates of civil-service reform, and has about reached the conclusion to discourage all efforts of the Progressives and other spoilsmen to take the "starch" out of the law. One would say, after the recent decision of the Appellate Division, that a man who was fit to be Governor of the State would not need to consult anybody about his course in this matter. Common sense is all that

is necessary to show that acquiescence in the inevitable is the only safe policy. The courts, including the highest in the State, have taken the position that the civil-service law, as it is upheld by the Constitution, is self-executing in the most rigorous form demanded by the reformers themselves. There is no escape from this, and the Governor who should try to escape from it would be something of a curiosity. There is only one way by which the Progressives can realize their hopes, and that is by securing the adoption of a constitutional amendment repealing the amendment on this subject adopted in 1894. That will be a task of sufficient magnitude to absorb all their energies for several years.

The outcome of Senator Raines's valiant determination to reform his own liquor law is somewhat amusing. He held an investigation, it will be remembered, of the law's workings in this and other cities, and accompanied his discoveries with a great deal of loud talk about the heroic remedies which he was going to devise to repair the law's defects. A perfect reign of terror for liquor-dealers was proclaimed as soon as Raines got to work in the Legislature. Now it is said that the law will not be changed at all, because Raines has been informed that the Republican politicians of the large cities will not permit the present condition of things to be disturbed. They are satisfied with the workings of the law; the liquor-dealers are satisfied; the Germans get their Sunday beer; and dire political consequences are threatened if any efforts be made to disturb the general content. The Raines hotels which have grown up under the law, and which have dissipated the terrors of a possible Puritanic Sunday, will remain in spite of all the loud threats of Raines to abolish them. Why? Because the Platt machine has been satisfied by most conclusive arguments that the present condition of things in the liquor world is as perfect as could be desired. Far be it from us to suggest that this happy result is the direct outcome of the noise which Raines made.

The difficulties of making work on public improvements meet the demands of "labor" have been freshly set forth by Superintendent Aldridge of the Public Works Department. He is engaged in operations under the act appropriating $9,000,000 for improvement of the canals, and he finds it impossible to satisfy the workingmen. Unskilled laborers receive 12½ cents an hour, or $6 for a week of eight-hour days, and most of the work is done so far from the homes of the employees that they have to pay two-thirds of their wages for board. Delegations of laboring men have repeatedly asked Mr. Aldridge to force contractors to pay higher wages, but he has been "compelled to say to all that the rate of wages constitutes a question which must be settled between employers and employees." In short, the Superintendent is constrained to make this discouraging admission:

> "One of the arguments used in favor of the $9,000,000 canal-improvement act was that this work would induce prosperity and afford relief where it was most needed. Up to the present time the work in this regard has been a disappointment."

All that Mr. Aldridge can suggest in the way of improvement is the passage of a law fixing a minimum price which shall be paid to unskilled laborers employed on State work, which he suggests should not be less than 15 cents per hour. This simply means that people who work for the ruling rate of wages in private employment shall be taxed to pay more than the ruling rate to those working under the State.

Commissioners Parker and Grant of the Police Board are clearly determined to show the public how thoroughly vicious the bi-partisan system is. Their conduct last week reached the farthest limit yet touched in this direction. They voted to uphold the Chief in an act of gross insubordination, thus taking a position which makes anything like strict discipline in the force impossible. The Chief had spoken with disrespect of the conduct of the Commissioners, who are his superiors—whether what he said was true or not does not matter; he added to this offence by refusing to make either excuse or apology. When the question of censuring him for his conduct and making charges against him came before the board, Messrs. Grant and Parker voted against it, dividing the board on the subject and virtually upholding the Chief. This proceeding was all the more inexcusable because the Mayor and Corporation Counsel had expressed the opinion that charges should be made against him. As usual in such cases, Parker and Grant made no explanation of their course, voting in silence in the same way that machine dummies always do. They are acting upon a general policy of opposing everything that Messrs. Roosevelt and Andrews propose, because the latter Commissioners are seeking to put the force on a basis completely removed from politics. Parker is doing this in accordance with his life-long practice, and Grant is helping him because the Republican machine has put pressure upon him which he is too much of a weakling to resist.

The Newark free public library is the first, so far as the public knows, to take a stand against the degradation of the press by refusing longer to admit to its reading-room two of the worst offenders among the daily newspapers of the country. The trustees, by a unanimous vote, have approved the report of the reading-room committee recommending this course, the committee having been stirred up to action by the librarian, who had been impressed by the demoralizing influence which an institution founded in the interest of education and morality was exerting when it allowed a mass of filth to be daily presented for inspection. The example of the Newark institution ought to be imitated by all library and reading-room associations throughout the country, and extended to all newspapers which are lowering the tone of the community, wherever published. People often lament the low estate of the press, and then ask what can be done about it. The Newark people have shown. Every self-respecting person can use his influence to have indecent newspapers banished from institutions of every sort which have reading-rooms.

In cool cynicism and jaunty self-sufficiency, Mr. Cecil Rhodes surpasses any state prisoner ever put on trial in England—for his examination by the Parliamentary committee is practically a trial. He convicts himself of deep conspiracy against a friendly state, and of lying unblushingly to cover up his tracks, and his only defence is, "Just look at the dazzling stakes for which I was playing!" Rhodes is no doubt fortunate in the time at which his examination is taking place, as well as most skilful in the way he plays upon popular passions. Friction with the Transvaal has again become serious, and President Krüger is again appealing to the Lord of Hosts against his enemies. All this plays into Rhodes's hand beautifully, and he appears to be justified in expecting to be let off with a warning to make his treason successful next time, so that it may no longer be treason. The Prince of Wales does not for nothing ostentatiously shake hands with a man in Rhodes's position.

The London *Economist*, which is very nervous, both politically and financially, over the Cretan imbroglio, enunciates, in its issue of February 20, a great truth when it says that "even Turks have difficulty in massacring superior force." It argues from this that the Greeks would be perfectly right in withdrawing from Crete, inasmuch as the strong naval and military demonstration made by the Powers would necessarily prevent the Turkish garrisons from murdering the inhabitants. But we infer that the perverse Greeks will insist on turning the argument the other way. They will subscribe to the doctrine of superior force, but will declare that, so far as Crete is concerned, they mean to be that force. The statement of Prime Minister Delyannis on Monday seems to leave no doubt on that point. Greece acknowledges herself a small nation, but puts the moral force of a great nation into her protests against Turkish misgovernment and inhumanity. Whatever the diplomats may say or do, there is ground for the Prime Minister's assertion that "all great peoples" sympathize with Greece.

MR. CLEVELAND'S PRESIDENCY.

MR. CLEVELAND first became an important political figure in 1881, when he was elected Mayor of Buffalo. He retires from public life to-day, having made a deeper mark upon the history of his time than any save the greatest of his predecessors. Little as it was then suspected, we can see now that there were circumstances connected with his selection for this first office which pointed to the possibility of the higher destiny in store for him. The office itself was that of the elective administrative head of a corruptly governed community; he was chosen as a party man, yet his work was to attack and frustrate partisan misgovernment. The weapon he found waiting for him was the veto; his first characteristic words, "This is a time for plain speech," were uttered in refusing to sign a legislative measure which he told its promoters was "the culmination of a most barefaced, impudent, and shameless scheme to betray the interests of the people and worse than squander the public money." Plain speech, courage, and honesty in similar situations of ever-increasing importance are what has made him a great President.

His career was connected with a movement which antedated his appearance by several years. As early as 1868, side by side with the agitation for civil-service reform, a popular longing began to make itself distinctly manifest for a President fitted to be a leader against "the politicians," the shifting, obscure, ignorant, and often corrupt body of placemen who, indifferent to the real demands of the country, were learning to manage its affairs in the interest of themselves or of schemes which would not bear the light, and paving the way for what we know in its perfected form as "Boss Government." Such a leader we had lost in Lincoln and were not destined to find in Grant. Such a leader the Liberal Republican movement of 1872 was intended to bring forward, but it resulted on one side in the fiasco of the nomination of Horace Greeley, and on the other in the unfortunate second term of Grant, and the domination of a Senatorial cabal, threatening by means of a third term to control the Government in perpetuity. Public opinion forced Hayes in 1876 upon the Republicans as it made Tilden the Democratic nominee. But neither Tilden nor Hayes thoroughly represented the ideas rapidly gaining ground.

Those ideas, put in a few words, were that the crying need of the country was, not more laws or new political ventures, but honest and intelligent administration of the Government as it stood; that this the politicians would never give us; and that we consequently needed a leader who would fight the popular battle against them. It was not clear then, as it is now, that the citadel of corrupt intrigue and abuse was in the great coördinated nominating machinery, the complicated congeries of primaries and conventions throughout the country, tending more and more, through standing committees, to become tyrannical political corporations. Perhaps it is fortunate that we did not clearly foresee what we have since experienced; perhaps if we had we should have despaired of the result. What was felt, rather than understood, was that the only way in which the system could be attacked was through the Executive—most effectively of all, by the most powerful of all executives, at Washington. That this feeling was a sound national instinct could now be proved by the subsequent course of events—by the steady increase in power of the Executives in the various States, by the general contempt which has overtaken the State Legislatures; by the constitutional movement which has steadily reduced their powers; by the rise in influence in great cities of mayors and other administrative officers; by the wrenching of the national civil service out of the congressional grasp. In 1880 the only thing that could be clearly seen was that if the institutions of the country were to be saved from the corruption which dogs the path of democracy as assassination does that of tyranny, relief must come from some one who had received his actual training in honest and orderly administration; some one who, even at Washington, would find in constitutional government nothing but a simple deed of trust.

No doubt it would be a mistake to imagine the career of Mr. Cleveland a realization of the ideal of the Independents of 1872. The gentleman whom they hoped to make President was a trained public servant, a publicist, an astute diplomat, whose advancement had come to him through long service. Mr. Cleveland became an important public man without much previous training, and really acquired his knowledge of government through governing. He has always taken pains to avow himself a strong party man, and has become a non-partisan President almost against his will. When he declared, on becoming Mayor of Buffalo, that "the affairs of the city should be conducted, as far as possible, upon the same principles as a good business man manages his private concerns," he did not put this forward as a novelty, but as sound historic party doctrine, though when his party followers found that he meant it, and was actually vetoing every exorbitant and illegal appropriation, they stood aghast. When, in the ensuing fall, he was elected Governor over Folger by nearly 200,000 majority, his tremendous victory no doubt confirmed him for the time in his view of the subject. When he went on foot to the Capitol on New Year's day, it was not a piece of clap-trap, but the act of a man of real simplicity of character and tastes, who was thinking of himself chiefly as a follower of a great party leader of the past. His governorship was intended to be a Democratic governorship. His vetoes were intended to be Democratic vetoes. It was probably not until he reached Washington in 1885 that he perceived that, to the great bulk of the politicians of his own as well as of the opposite side, party meant office and nothing else. With characteristic caution he reminded his supporters that even faithful party service cannot be "always rewarded by appointment to office," and merely promised a faithful enforcement of the civil-service law, by means of which he was in a few years to give the death-blow to the entire spoils system.

During his first term he hoped that he might revive the party glories of the past. He proclaimed in 1885 the disaster involved in silver coinage because his conviction was that Democrats could not be inflationists; he insisted in 1887 on a tariff for revenue because he knew that Democrats could not be protectionists. He did not then conceive it possible that the whole vast machinery of his party might itself be swallowed up by corrupt interests. In 1888, speaking of this period, he said: "I knew then that abuses and extravagances had crept into the management of public affairs; but I did not know their enormous power, nor the tenacity of their grasp. I knew then something of the littleness of partisan obstruction, but I did not know how bitter, how reckless, and how shameless it could be."

Mr. Cleveland's first administration showed that we had at last got a President of the first rank, fully capable of dealing with the subjects of finance and revenue urgently demanding attention, a man of singular courage and independence of character, ready to confront the enemies of the country as his own. It is a common fallacy to suppose that those who wish the support of a democratic community must get it by time-serving and flattery, by glib appeals to prejudice and passion, by cowardly compromise with every base plot that is afoot. The example of Cleveland, supported for fifteen years in his struggle for good government by constant popular majorities (for the defeat of free silver in the last election was a vindication for him), is alone enough to stamp the theory as false. For a popular leader the one indispensable quality is that which is always lacking among politicians dependent on place for their support. What has made him for twelve years the inevitable representative of the American people has been the fact that he could not be made afraid.

His two administrations have been so crowded with events of importance that we can barely touch upon a few of them. In foreign affairs the principles avowed by him, and usually acted upon, have been eminently pacific. On several occasions, however, he has, in order to gain support at home, shown the readiness to

make use of a defiant tone abroad, which his warmest friends could only regret. The attempt to force Mr. Keily upon a court at which he could not be received, the summary dismissal of Lord Sackville, the demand for authority to retaliate on Canada in 1888 because the fisheries treaty had failed in the Senate, and the Venezuela message, seemed too much like efforts at a belated imitation of Jacksonian barbarism to gain the lasting admiration of the America of to-day. His success in getting England to arbitrate with Venezuela does not justify his threat of war, and his introduction of the Monroe Doctrine into a question with which it had nothing to do, instead of being an advantage to this country, can but prove a source of danger. On the other hand, the treaty negotiated in 1884 to establish a protectorate of Nicaragua was withdrawn from the Senate in a message which might have been written by Washington. His repudiation of the Hawaiian revolution and movement for annexation was an act of simple but very courageous international justice, made necessary by the fact that our minister had taken an active part in the rising against the Government to which he was accredited. His enforcement of the neutrality laws during the Cuban troubles and his support of American interests in Cuba have been beyond praise, and his recent message on Cuba shows that he has done his utmost to secure from Spain guarantees of justice and humanity in its dealings with the island. If the fisheries difficulty with England is not flagrant, the fact is due to a *modus vivendi* established through his efforts, while the general arbitration treaty with England is so great a triumph for peace that, even unratified, it is likely to render war impossible.

Mr. Cleveland's domestic administration is called a failure only by the enemies who have done their best to make it so. With a Congress legislating in the interest of inflation, protection, and waste, it is impossible for a President to do much more than make the issue plain. There is no real evidence anywhere that his conduct to-day is not as popular throughout the country as it has been all along. Even in 1888, though the electoral machinery gave the Presidency to Harrison, Cleveland's vote at the polls remained the largest in the field. Two years later the country had repudiated the McKinley bill and the wanton waste of Congress, and in 1893 Mr. Cleveland came into office, still a party man trying to revive lost party ideals, but, besides this, the President of a whole people face to face with the misgovernment and corruption entrenched in its Legislature. When he forced the repeal of the Sherman silver-purchase act; when he killed the Bland bill for coining the seigniorage; when again and again he urged real tariff reform; when he vetoed job after job; when he quelled disorder in the strike of 1894, and when, above all, he maintained the credit of the Treasury throughout the world, in defiance of partisan and press fury, he obtained success in defeat.

It is a noticeable fact, in a period in which politicians generally seem to have lost the art of forcible and direct speech, that the few pithy phrases that have caught the attention and approval of the public have either come from him or been occasioned by him. The best of them have not been witty epigrams, but homely maxims, the truth of which no one can deny, but which all mankind find it so hard to act upon. That public office is a public trust, and that a government which undertook (because people supported it) to "support the people" would be doomed, are statements that become eloquent as the challenge of a bold man to those who are betraying trusts and "corrupting the poor with the money of the rich." "We love him for the enemies he has made," was the vigorous expression of an undeniable and most significant fact.

The most frequent criticism upon Mr. Cleveland's character from those who, without being openly hostile, have tried to justify their want of admiration by a sceptical analysis, has been that his public life has been marked by what are called the commonplace virtues. Courage, a love of truth, common sense, and integrity he is admitted to have; but where, his critics ask, is his greatness? What brilliant schemes has he advocated? What remarkable intelligence has he shown? Why, if he is a great man, does he go out of office amid the wreck of the party of which he was the chosen leader? Where is the tact, the power of managing and inspiring a following, which is the true mark of statesmanship? We have endeavored to suggest what we believe to be the true answer to these questions; but that the virtues which are conceded to him can be declared commonplace, shows a ludicrous misapprehension. It is because courage and truth and common sense and integrity are rare qualities in the world that, when they appear together in one character, they give their possessor such astonishing and seemingly inexplicable importance. Work, however done, may always be done more skilfully; but those who think, if there are any such, that Mr. Cleveland could have done his without exciting ferocious and increasing opposition, forget what it has been. As Governor and President he has killed a mass of special legislation—in other words, of jobs—which has meant the loss of hundreds of millions of money that their promoters would have filched from the public. He has stood alone between a rich and busy community and a horde of desperate plunderers, and beat them off. Not only this, but he has maintained the public credit in the teeth of a legislature most of whose members were perfectly willing to betray it to advance their own selfish interests. Where other statesmen have left behind them a monument of wise laws passed, he has left a monument of foolish and base laws prevented. Such work cannot be done by means of tact.

As Mr. Cleveland retires to private life, not one of the public enemies he has made his own but will heave a sigh of relief. Not an unjust claimant but will feel his hopes rise, not a boss but will rub his hands with delight over what he thinks his improving chance of plunder and patronage. But Mr. Cleveland's public service has had one result which getting rid of him cannot now undo. The long contest between him and his opponents has made clear the real nature of the opinion of the country, on almost every important public question, in such a way that it cannot be mistaken by any President who desires popular favor. His present successor could not have been elected but for an appeal to the same public opinion which for twelve years trusted in Cleveland, and was trusted by Cleveland.

MR. HOBART'S OPPORTUNITY.

The inaugural address which Mr. McKinley will deliver to-day can be discounted in advance. Unless it differs from all foregoing addresses of the kind, it will be intensely patriotic in tone; it will doubtless declare for national good faith and a secure and stable currency; it will breathe a spirit of peace at home and abroad; it will very likely foreshadow a policy of increased taxation in order to increase revenue. But it cannot, in the nature of the case, touch directly upon the great menace to the new President's administration and to the country. It cannot speak of the sullen, brute force in our public life which has thrown itself athwart the execution of any rational policy. In other words, it cannot tell the truth about the United States Senate. But the man who will take up the gavel as presiding officer of the Senate on March 4 can do what Mr. McKinley cannot do. By what he says and what he does he has an opportunity to electrify the nation. He may easily make his five minutes' inaugural the great event of the day, and outline a policy of legislative reform which must be executed before any other reform whatever can be attained.

In place of the ordinary meaningless remarks, Vice-President Hobart might say something like this to-day:

"Senators: My predecessor, on taking this chair four years ago, characterized you as 'the most august legislative assembly on earth.' He himself would now doubtless give worlds to withdraw that phrase. At any rate it is my duty, sent here as I am by the direct vote of the people, to tell you that you are nothing of the kind. No other legislative body in a free country is so much despised and at the same time dreaded as you are. Abroad you are pointed to as a horrible example

of a once great assembly degenerate. At home you are considered a standing and deadly obstacle to political and financial reform, a threat to business, an enemy of peace—in short, the one great danger-point in our body politic on which the eyes of our alarmed citizens are fixed. It is my solemn duty to notify you that you must set your house in order lest the popular wrath find some way either to mend or end you. Another four years, like the last, of steady affront to the best sentiment of the nation, of aid and comfort given to agitators and incendiaries, of shameless trifling with the country's good name and as shameless speculating in the stock markets, of dull, insensate opposition to all political progress and political purity, will fill up the cup of your iniquity. Beware lest an outraged people press it to your own lips.

"But it is my duty also to be specific as to the nature of the chief evil in which you are engulfed, and as to the remedy which I propose to apply. You have deliberately put yourself in the power of the worst men in your body. One Senator, strong in prejudices or self-interest, with front and lungs of brass, is able to withstand and defy all the rest. You have justified and tolerated this outrage on the ground of the dignity of the Senate, on the ground of the courtesy due a fellow-Senator. But what you have really done is to make the dignity of the Senate a hissing and a byword, to make the courtesy due Senators something lower than the honor which exists among thieves. As far as it is in my power, I propose to put an end to this monstrous abuse. It will be necessary for me to enforce your rules, but there are also certain general parliamentary rules, essential to the civilized dispatch of public business, which I shall likewise enforce. One of these is the duty of a presiding officer to make a debater speak to the question. When the Indian appropriation bill is before the Senate, I shall call any Senator to order who proceeds to discuss a war with Spain. I shall not allow a four hours' rehearsal of the crime of '73 to be made under guise of discussing the bill for regulating the Congressional Library. Nor shall I permit the laxity of the Senate rules to defeat the end of all rules—the bringing of the question to a vote. When talk becomes evidently and defiantly obstructive, I shall ask the support of a majority of the Senate in putting the question. By co-operating with me in these simple and imperative reforms, Senators, you will do much to save the session from wreck, the country from peril, and yourselves from yet deeper ignominy. What is the pleasure of the Senate?"

The first effect of such an address on the Senate would no doubt be painful. Senatorial dignity would fall a-shrieking. The courtesy of the Senate would be more than usually indistinguishable from ruffianly blackguardism. But the country? Would it not rise in delight and hope at the sight of a firm, strong man taking an inveterate public abuse by the throat? Vice-President Hobart would not get his needed support in the Senate the first day, nor the second, nor the fortieth. But in time it would be his. He could insist day after day that Senators should not beat the air, and though the beating would be allowed to go on for a while, public opinion would at last compel a majority of the Senate to join with him in suppressing it. With a resolute presiding officer exposing and rebuking wilful obstruction of the public business, it would at last curl up in the aisles of the Senate and die.

Mr. Hobart's opportunity is great. He is an experienced presiding officer, having been Speaker of the New Jersey Assembly and twice President of the New Jersey Senate. He is now the constitutional presiding officer of the United States Senate. Let him really preside. By doing so he would rescue the vice-presidency from its traditional obscurity and helplessness, and make of it a great and beneficent office. He could easily make himself the most popular man in the country. Better than that, he could contribute much towards removing a national disgrace and danger, and point the way out of the legislative paralysis which now threatens to make all policies failures and all administrations impotent.

THE SANGUILLY AFFAIR.

It is hard to speak in moderate terms of the display of reckless demagogism and incapacity which the Senate made of itself on Thursday. The day before, the committee on foreign relations reported a resolution in these terms:

"Resolved, That the Government of the United States demands the immediate and unconditional release of Julio Sanguilly, a citizen of the United States, from imprisonment under the charges that are pending and that are being prosecuted against him in the military and civil courts of Cuba upon alleged grounds of rebellion and kidnapping, contrary to the treaty rights of each of said governments, and in violation of the law of nations. And the President of the United States is requested to communicate this resolution to the Government of Spain, and to demand of that Government such compensation as he shall deem just for the imprisonment and sufferings of Julio Sanguilly."

Although the public have learned, during recent years, to make large allowances for the eccentricities of this committee, and not to take them too seriously, yet the sober and peremptory tone of this resolution made an impression on the public mind, more especially as Senator Sherman, the chairman of the committee and prospective Secretary of State, declared that the committee was unanimous in reporting the resolution, and that he hoped the Senate would take it up the following day. These remarks gained additional force from the fact that the end of the session was only a few days distant, and its necessary business was unusually behindhand. In view of the solemnity of tone in which the demand upon Spain was to be made, and the possible consequences of it, stocks declined, the confidence of business men was shaken, and most people went to bed that night with sore hearts.

The next day it appeared that Sanguilly was not a citizen of the United States, or at all events that nobody was able to show that he was such, and further that he had been pardoned by Spain before the Senate committee adopted its resolution. As soon as these facts transpired in the Senate chamber, Senator Sherman was seized with a sudden desire to pass an appropriation bill that had been laid aside in order to take up the Sanguilly resolution. This was altogether too tame and pusillanimous a course for the blatherskite majority. These, led by Morgan, Allen, Lodge, Frye, and Mills, were not to be put off by any such makeshifts as the non-citizenship of Sanguilly or his release from a Spanish dungeon. As to his citizenship, he had naturalization papers, and those were sacred, like the American flag, until proved false by conclusive testimony. Senator Hoar, on the other hand, pointed out the fact that the record of the case showed that Sanguilly had spent the five years next succeeding his declaration of intention to become a citizen of the United States, in Cuba, and in arms against the Spanish Government; whereas our naturalization laws require that he should have spent them in the United States in order to acquire citizenship. That fact did not alter the sublime purpose of Lodge to make the eagle scream. He did not know whether Sanguilly's naturalization was fraudulent or not. What he did know was that if Sanguilly held a certificate of citizenship from the Queen of England and he had been incarcerated in like manner, "England would have had him out of his prison, and would have had him surrendered at once, if it had taken her whole fleet and all of her army to do it." Indeed! But England would have learned the facts in the case first, and not have put herself in the humiliating attitude of demanding the release of a man who was not her citizen and who had been released already. She would have taken account, too, of the peculiar fact that Sanguilly's change of citizenship was a manifest sham and pretence, having for its purpose the protection of the sovereignty of a foreign country in which he had no intention of residing or performing any of the duties incumbent on a citizen.

But more scandalous revelations were to come. Secretary Olney once more quietly took the public into his confidence and left senatorial intriguers dangling. This time it was Senator Sherman who was hung up for the admiration of the country. In his capacity as chairman of the Senate committee on foreign relations, Mr. Sherman was confidentially informed

by the Secretary of State on February 17 that Sanguilly was on the point of being released. Mr. Olney added that the matter was of "a somewhat delicate nature," and said that "any public discussion of the case in the Senate" could not but injuriously affect the flattering prospect of Sanguilly's pardon. Five days later, Mr. Sherman joined the other members of his committee in precipitating the public clamor about Sanguilly—in other words, in doing his best to keep in jail the man whom he was professing to cry to Heaven to get out of jail. So far as known, Senator Sherman did not give the committee or the Senate a hint of the information conveyed to him. Why he did not, it became his instant duty to explain. Did he forget Mr. Olney's letter? If he did, all that has been said about his mental decay is more than justified, and McKinley must be shivering to think of the man he has chosen for his Secretary of State. If, on the other hand, the chairman of the committee on foreign relations deliberately suppressed this most vital communication from the State Department, it was a most gross and shocking offence, which of itself would have warranted McKinley—even at the eleventh hour—in choosing another Secretary of State.

Amid all this mock fury and imbecility, not a particle of evidence had been exhibited that the rights of American citizens in Cuba had not been watched over with vigilant zeal by Secretary Olney. Indeed, the extraordinary thing is that Mr. Olney should have been suspected of lack of vigor in standing up for American rights abroad. Brusque energy has characterized his entire administration of the State Department. We have had no such hard-hitting man in charge of foreign affairs for years, if ever. Yet the aged Senators, in their ardent desire for a war, forgot how he left them all gasping with astonishment at his Venezuelan audacity, and thought, or affected to think, him as nerveless as the Jingo papers painted him. Mr. Hitt of the House committee on foreign affairs happily did not share this delusion, but kept himself, as he should, in touch with Secretary Olney, and smothered every firebrand sent to his committee. The legacy of trouble which Mr. McKinley will receive in this Cuban business will be left him, not by Secretary Olney or President Cleveland, but by the passionate and reckless Senate. That body has become the dangerous explosive of our public life. Mr. McKinley will have spokesmen and a party support in the Senate, as Mr. Cleveland has not had of late; but the Ethiopian is not going to change his skin suddenly on March 4, and any sudden cause of friction with Spain, any naval accident on the Florida coast, may set the Senate dragging the President into a war before he knows it.

SIGNS OF THE TIMES.

THE Southern farmers are again showing that it is not the principle of combination to which they are opposed, but the use of that principle by any other class of people than farmers—except "organized labor." They denounce bitterly any union on the part of those who buy their cotton to raise the price of products manufactured from it, but they earnestly advocate the adoption of measures to make the manufacturers pay higher prices for the staple. The President of the Cotton-Growers' Association has issued an address calling conventions of the Texas farmers at Waco March 8, of those in the Mississippi valley at Memphis March 10, and of those east of the Mississippi at Augusta March 15, to secure "concert of action," as "by a systematic and judicious marketing of our crops we can realize inestimable benefits that never can be secured permanently otherwise." The method urged upon the cotton-growers is that which is so bitterly complained of when applied by the cotton-manufacturers—a restriction of the output in order to secure higher prices. "Destroy the annual surplus of cotton," is the watchword. "You will be better off with a 7,000,000-bale crop selling at 10 cents, supplemented by ample food crops, than with a 10,000,000-bale crop selling at 5 cents."

The farmers in the South Carolina Legislature gave on Thursday another illustration of the tendency of all farmers toward class legislation, by passing through the lower branch a bill requiring everybody except farmers and laborers to get a license to work. The proposed law provides that "every person, firm, company, or corporation engaged or intending to engage in business in this State shall obtain on or before May 1, 1897, a license." Nearly a column of fine type in a newspaper is required to give the list of businesses and the amount of the licenses, and the list is full of queer features, as, that "artists, ambrotypists, photographists, etc.," must pay 25 cents for each thousand inhabitants of the place where they "do business"; barbers, 25 cents for each chair in the shop; dealers in any article of merchandise, each $1 for the first $10,000 or less of goods, etc., sold, and 25 cents for each additional thousand sold; fruit and peanut dealers, with stand on street, $1; lawyers, physicians, dentists, chemists, $5 each, without regard to their income or the population of their places of residence; hand laundries, 50 cents. But while the poor country doctor must pay $5, the richest farmer pays nothing; and while the poor laundry-woman must pay 50 cents, the best remunerated laborer pays nothing.

The system of licensing not only is grossly unjust in exempting from its operation the great majority of the people, but also appears to be plainly unconstitutional. The new Constitution of the State authorizes the Legislature to provide for "a *graduated* license on occupations and businesses," but the bill which has passed the lower branch disregards the principle of graduation almost entirely. It is true that "artists, ambrotypists, photographists, etc.," are taxed at the rate of 25 cents for each thousand inhabitants of the place where they "do business," and that dealers in merchandise selling over $10,000 worth of goods a year must pay 25 cents for each additional thousand sold; but all lawyers and physicians are mulcted in the uniform sum of $5, whether their income be $500 or $5,000, every hand laundry must pay 50 cents whether it is a small one run by a poor woman or a large one that does a profitable business, and so of many other occupations. This is only another illustration of the familiar fact that few legislators nowadays care enough about the Constitution even to read it and find out what it allows.

The whole assumption underlying this system of licensing occupations and businesses, as well as the anti-Trust law of Texas, both of which exempt farmers from their operation, is that the agricultural class of the population is entitled to special privileges. It was high time that this assumption should be taken in hand by an authority whose words would command respect, and we are glad to see that Judge Swayne of the United States District Court did this, in his recent decision annulling the Texas anti-Trust law for unconstitutionality. The Judge declared that a careful study of the act showed that "it aims to favor the agricultural class, and is against the merchant and mechanic and all the others, without either reason or justice," and said:

> "We are familiar with the duties of the farmer, and the cares and trials of his business life, and appreciate highly the customary compliments paid by mankind to the rural yeomanry of the land; he has been justly lauded for his integrity and for the independence and importance of his calling; without the products of his toil people cannot live, nor society endure; yet, what is there about it all to entitle him to the privilege of combining in restraint of trade as to those articles he produces, while his neighbor, the storekeeper, and mechanics are precluded therefrom?"

It is, of course, class legislation of the most odious sort when a majority of farmers in a State impose taxes upon men engaged in all other occupations, and a similar majority in another State forbid combinations to raise prices on the part of all people except themselves and "organized labor." The manufacturers of cotton may not combine to raise the price of cloth, but the growers of cotton may combine to raise the price of the raw material from which the cloth is made; the sellers of meat may not combine to raise its price, but the raisers of live stock may combine to raise the price of their cattle—to state such propositions is enough to show the gross injustice of a law which would permit such discriminations. Judge Swayne quoted two striking passages bearing on this very point, which he said are "almost prophetic in

some respects," from decisions rendered by Judge Catron of the United States Supreme Court many years ago:

"The rights of every citizen must stand or fall by the same rule of law that governs every other member of the body politic under similar circumstances; and every partial or private law which directly proposes to destroy or affect individual rights, or does the same thing by affording remedies leading to similar consequences, is unconstitutional and void. Were it otherwise, odious individuals or corporate bodies would be governed by one law, the most of the community, and those who made the law, by another; whereas a like and general law affecting the whole community equally could not have been passed.

"The idea of the people, through their representatives, making laws whereby are swept away the life, liberty, and property of one or a few citizens, by which neither the representatives nor their other constituents are willing to be bound, is too odious to be tolerated in any government where freedom has a name."

THE HILL OF TARA.

DUBLIN, 1897.

OF those who have heard of the famous Hill of Tara, few there are who could say where it is situate, and still fewer what is to be seen upon it. In Ireland, at least, everybody knows Moore's verses, which a beautiful air has made popular; and every patriotic Irishman, wherever he may dwell, is held bound to feel a throb of sentiment at the name of the ancient capital of his ill-starred country. But even in Ireland the visitors to Tara seem to be extremely scarce, and in travelling through Ireland I have found only two or three persons who could tell me anything about a spot which is much more remarkable from the part it plays in the traditions of prehistoric times than any place in England or in Scotland belonging to the legendary period.

Tara is, however, easily accessible, being only some three miles from a railway station, to which the train—a slow train, as nearly all trains in Ireland are—brings you in an hour's time from Dublin. The hill is about five hundred feet above tide-water and about two hundred feet above the average level of the surrounding country. This seems a small elevation, yet, as the land is fairly level for a long distance in every direction, the top of the hill commands a very extensive as well as beautiful prospect. All round are the rich green pastures and scattered woods of Meath, one of the greenest and richest countries in Ireland; while the far-off horizon is bounded by irregular groups and ranges of mountains. To the south, beyond Dublin, are the bold summits of Wicklow; to the northeast, and distant some forty miles, the still bolder peaks of the Mourne Mountains; to the northwest, the bare ridges of Cavan; while in the southwest, sixty miles away, one catches the long blue line of the Slieve Bloom range, which looks down upon Lough Derg, with its sacred island, and the middle course of the Shannon.

No monarch could desire for his palace a finer site, nor one commanding a wider sweep of country; and it may well be that the advantages which the site afforded for discovering the approach of an enemy from a distance was one of the reasons why this height was selected for a royal residence. Another may be found in the richness of the surrounding pasture-lands, where the cattle, which constituted the chief wealth and support of the primitive Irish, could thrive and fatten. And although the hill is not comparable for the natural strength of its position to the rocky heights on which the castles of Edinburgh and Stirling and Dumbarton have been built, or to a Greek Acropolis such as that of Athens or Corinth, still it is, like Old Sarum in England, steep enough and high enough to render much more easily defensible any entrenchments placed on the top of it. It is, indeed, as good a spot for defence as can well be found over a wide range of surrounding country, for in this part of Ireland the undulations of the hills are gentle, and outbursts of igneous rock, such as occur frequently in the northeastern counties, are scarcely to be found.

The Hill of Tara itself is about half a mile long by only some two hundred yards wide at the top. It forms a ridge running nearly north and south, sloping pretty steeply to the west, and rather more gently to the east, and is covered with smooth turf, the subjacent limestone rock cropping out only in one spot on the lower slope to the west. Scattered over the hill are numerous mounds and ridges, the latter mostly circular, with no trace left of a stone building, though the presence of a number of loose stones in one of the earth circles shows that a wall or a fort of stone may have existed at some remote period. About ten or twelve distinct earthworks can still be distinguished, and slight inequalities in the grassy surface of the hill prove the former existence of others whose shape can no longer be determined. If we had no further clue to the origin or history of these remains, the spot would be romantic, but nothing more. But—and this is the peculiar interest of Tara—there exist some ancient Irish poems and prose tracts, ascribed to writers of the sixth, seventh, and eighth centuries, and preserved in the collection called the 'Dinnsenchas' (itself compiled in the twelfth century from old materials), which give a curiously minute topographical description of the hill and the various erections on it as these stood in those early centuries. When the first Ordnance survey of Ireland was being carried out in 1837, Dr. Petrie and some other learned antiquaries examined the hill by the light of these ancient records, and succeeded in identifying such earthworks as then remained with those described by the ancient writers. Though in the last sixty years a few of the mounds and ramparts which Dr. Petrie saw have been almost obliterated by the stupid selfishness of the owners of the hill, who have levelled the ground for their own purposes, and by the strange indifference of the public, which has made no effort (till the passing of the Ancient Monuments Act in 1884) to preserve these relics of antiquity, still Petrie's description remains substantially true of the place as the traveller sees it to-day; and by the help of his translations from the 'Dinnsenchas' one can tell what purpose each mound served.

On the top of the hill, where it begins to decline towards the south, is a large circular enclosure, 850 feet in diameter, surrounded by a dry ditch and a low earthen wall two and a half feet above the natural level of the hill, and in places six and a half feet above the bottom of the ditch. Within this enclosure, which is called Rath na Riogh, the "Fortress of the Kings," are several smaller earthworks and mounds, one of which, called the Forradh, or Place of Meeting, is probably the oldest monument on the hill, the seat of the most ancient dwelling of the primitive Irish kings. It is enclosed by two ramparts and two ditches, still in fair preservation, and as it seems to be older than a similar earthwork adjoining, which was called in the sixth or seventh century the House of Cormac, from Cormac Mac Airt, a king who reigned in the third century, it may very well belong to the first or second century of our era. Of the other remains (which are too numerous to mention in detail) the most remarkable is a long, narrow enclosure lying further to the north, and called the Banqueting Hall, or House of the Heroes. It is 760 feet long by 50 broad, with a number of apertures on each side corresponding with the number of the entrances given by the ancient poets, and was doubtless the spot in which the great feasts and recitations of poems to music took place, at the triennial gatherings which the kings of Ireland convoked at their capital.

That no traces of buildings in masonry remain at a place which the number and size of these earthworks prove to have been of great importance and often tenanted by a large population, is doubtless to be ascribed to the fact that the houses in which the inhabitants dwelt, and the halls in which they held revel, were all constructed of wood or wicker-work only. There seems to have been no masonry-work in Ireland before the introduction of Christianity in the fifth century, and stone was used only for the erection of loose walls of defence, such as those huge ones which remain in the Isle of Arran on the west coast. Round Tara there is very little stone to be had, and no doubt all the buildings which stood within these enclosures and upon these mounds were of timber only. They may, however, have been of considerable size, and the beauty of the numerous gold ornaments, dating from very remote times, which have been discovered, some very fine ones at Tara itself, shows that the arts of decoration had made considerable progress among these ancient Celts, as we know that music and poetry had also done.

According to the legends preserved by poets and annalists of the Christian period, Teamhair, or Tara, was first occupied by a Firboly king more than a thousand years before our era, and continued to be the chief residence of the monarchs till the reign of a king named Diarmaid, or Dermot, in the middle of the sixth century. This king had quarrelled with a famous saint of that day named Ruadhan, and the curses which the saint laid upon Tara as well as upon the king himself, caused the seat of royalty to be for ever withdrawn from it. The curse of a saint was terrible, especially if the saint was "fasting on his enemy" when he uttered it. No other spot in Ireland succeeded to the fame of Teamhair as a royal residence and a place for the meeting of the national assemblies; and the poets who thereafter celebrated the glories of the ancient kings continued, down to the days of the Anglo-Norman conquest, to make Tara the frequent theme of their song, although it was then already deserted. So far as anything can be considered certain in Irish history before the coming of St. Patrick, it is pretty certain that Tara had been then for some centuries the usual seat of the monarchy and the centre of such national life as existed. Nor is there any reason to doubt the tradition which brings St. Patrick himself to Tara to confront and defy King Laoghaire (of whose Rath or fortress traces still exist on the Hill). The very remarkable poem called "The Breastplate of St. Patrick" is, by the same tradition, stated to have been composed by the missionary when he went to meet the king. Whether or no it is the work of Patrick himself, it must belong to the earliest age of Irish Christianity, for its profession of the Christian faith is tinged by lingering pagan beliefs which would

have been strange to ecclesiastics of a later time. The saint's name is connected with a well on the stream flowing from which had been set up, in pagan times, the first water-mill ever erected in Ireland. Unhappily, a more recent memorial of his visit has been very recently added, in the form of a poor and tasteless statue of the saint himself—a "work of art" which had been intended for the Chicago Exhibition of 1893, and which, failing to obtain a place there, has been set up here, where it is grotesquely out of keeping with the landscape and the prehistoric remains.

Tara was a place of civil and military rather than of ecclesiastical importance. It had never a round tower, and no ancient churches are mentioned. The parish church which now stands on the Hill is modern and uninteresting. Synods, however, were held—one of the earth-circles is called the Rath of the Synods; and St. Adamnan of Iona, the biographer and successor of St. Columba, who presided at one of these, is commemorated by a very ancient cross, bearing a rude figure (now much defaced), which stands in the church-yard, close beside one of the two very ancient stones called the gravestones of the Druids. An old legend says that these stones used to stand close together, and that whenever the new King of Erin was chosen and (as the custom was) placed in a chariot drawn by two horses never previously under the yoke, the stones moved apart to permit his chariot to pass between them if he was worthy of the throne, but remained fixed if he was unworthy.

A still more curious and famous stone stands in the most ancient earthwork, that called the Forradh, or Place of Assembly. It is the stone on which the newly chosen King of Ireland placed his feet, and which roared if he was a person deserving of the honor. It is repeatedly mentioned by the old writers, who call it the Lia Fail (usually interpreted Stone of Fate), and say that it stood by a hillock called the Mound of the Hostages, being the place where the King used to keep the hostages he had taken from the provinces of Ireland. It was removed to its present site in 1798, to mark the graves of the insurgents who were killed at Tara in the great rebellion of that year—a curious use to which to put a prehistoric monument. It is a bluntly conical obelisk of gray crystalline limestone, standing six feet high from the ground, and with five or six feet more under the surface. Probably it was an object of worship in heathen times The same name of Lia Fail is given to a still more famous stone, that upon which the Pictish and Scottish kings were crowned at Scone in Perthshire, and upon which the sovereigns of the United Kingdom are crowned to this day. This Scottish stone, however, which is the oldest and greatest curiosity of Westminster Abbey, was obviously used as a seat, which the Irish stone, having regard to its shape, can hardly have been.

Those who have noticed that on the Hill of Tara there are no architectural remains, nor indeed anything but grass-grown mounds, earth ramparts, and ditches, may ask wherein consists the peculiar impressiveness and even charm which the place, by the testimony of those who have visited it, possesses. Its interest lies in two things. One is that no other prehistoric monument in the British Isles is at once so ancient and so important. There are abundant remains, both in England and in Scotland, of the hill strongholds of the ancient Celtic peoples, but none had anything more than a local importance, and none shows anything more than walls and ditches of defence. Here at Tara we have a great variety of earthworks destined to different purposes, and the place was the capital of a kingdom for those days large and important, the scene of assemblies, political, military, ecclesiastical, and festive, which brought men together from every part of the island. And the second feature of special interest lies in the fact that, whereas there exists absolutely no information regarding any of the camps or towns or places of worship of primitive England or Scotland—nothing about Stonehenge, or Avebury, or Old Sarum, or Caerleon upon Usk, or even regarding the Roman cities of Uriconium and Silchester—we have for Tara descriptions so careful and minute from the earliest Irish writers that we can to-day identify and tell the purposes of these grasses, ridges, and circles, and picture to ourselves with tolerable completeness the hill fortress of the fourth century, with its kings and wizards, its bards and soldiers, and the crowd of cattle-herding dependents whose huts lay along beneath. Fantastic legends cluster round many of the spots mentioned by the old poets; and two or three of the scenes which they describe, notably the meeting of St. Patrick and the heathen king Leoghaire, and the cursing contest of St. Ruadhan and King Diarmaid, have probably an element of historical fact. Thus the place has a wealth of poetic and semi-historical associations which make it unique in the British Isles, for it belongs to centuries when in other parts of the islands history is almost silent; and its very solitude and simplicity, with nothing to speak of the past except the green lines of ditch and rampart, the rude cross and the mysterious stone pillars, make upon the imagination an impression more powerful than the elaborate works of a civilized people might have produced.

There is at present in England a remarkable revival of interest in old Celtic literature. It is to be hoped that one result of it may be to secure the publication of a number of these very ancient Irish poems, belonging to the centuries between the coming of Christianity in the fifth century and the Anglo-Norman invasion in the twelfth, which connect themselves with Tara and its kings, and enable us to realize the character of a primitive society which was, despite its rudeness and its ferocity, prolific of men learned in the learning of their time, full of intellectual life, and proud of its intellectual achievement. Y.

Correspondence.

TRUSTS AND CONSUMERS.

To the Editor of The Nation:

Sir: Recurring to your question as to the object of the Lexow Trust Investigation, its possibilities, etc., contained in column three, page 118, of the issue of February 18, 1897, permit me to quote from page 74 of 'Recent Economic Changes,' by David A. Wells, as follows:

"Society has practically abandoned—and from the very necessity of the case has got to abandon, unless it proposes to war against progress and civilization—the prohibition of industrial concentrations and combinations. The world demands abundance of commodities, and demands them cheaply; and experience shows it can have them only by the employment of great capital upon the most extensive scale. . . . To the producer the question of importance is, How can competition be restricted to an extent sufficient to prevent its injurious excesses? To the consumer, How can combination be restricted so as to secure its advantages and at the same time curb its abuses?"

Then what do the party platforms mean when they declare against Trusts, and the public men—even Mr. Cleveland—when they declaim? Flournoy Rivers.

Pulaski, Tenn., February 21, 1897.

To the Editor of The Nation:

Sir: The platform of the Republican City Convention of Chicago, adopted February 26, contains the following plank:

"In our opinion, one of the crying evils of our city is the destruction of the profits of the small shopkeepers by the competition of the department stores, which, by the use of labor grossly underpaid, have succeeded in largely driving out of business the many smaller storekeepers throughout the city, and we hereby request such legislation from the State of Illinois and the City Council as will prevent the combination of the many different kinds of storekeeping, otherwise unallied, in the great department stores. We believe that *the theory of the Republican party in favor of protection goes to the extent that the local business of every neighborhood*, so far as possible, *should be transacted in that neighborhood*, and we favor, as far as may be legally done, the wiping out of the present system of big department stores."

Of course, if the theory of protection has any validity whatever, the convention is right. In order to carry out the principle, let every city, town, and village enact a prohibitive tariff against its neighbors, and let every neighborhood in every city and town protect itself against every other neighborhood. Then the millennium will come; then we shall all be rich, happy, and prosperous; then "the local business of every neighborhood" will "be transacted in that neighborhood," and the wicked free-traders at last see the error of their ways and acknowledge the greatness of the principle of protection!

Yours respectfully,

Edwin I. Felsenthal.

450 W. Randolph Street, Chicago, Feb. 27, 1897.

THE VENUS OF MELOS.

To the Editor of The Nation:

Sir: Evidently the unfortunate award which Paris made of the apple of Discord is destined to exert its baneful influence upon the modern world no less than it did upon the ancient, as the heat of the controversies over the most beautiful statue of the recipient of the apple shows no sign of abating, although nearly seventy-seven years have passed since the discovery of the statue and the beginning of the dispute. Recently new fuel has been added to the flames by the publication of an article in *L'Illustration* of December 12, giving what was claimed to be new and convincing testimony upon two important points—the date of the discovery of the statue, and the condition of its arms at that time. With his characteristic thoroughness, M. Salomon Reinach has shown from contemporary documents how absolutely devoid of value this testimony is, in a letter published in the *Chronique des Arts* of January 9 and 16.

In the *Nation* of February 18 Mr. Stillman has added force to M. Reinach's statements by expressing the same opinion, based upon his own investigations in the island of Melos. But, by the unhappy fatality which awaits all those who attempt to solve the mysteries of the Venus, he raises new difficulties while settling old ones. There are in his account one

or two statements which are not supported by the official documents, and, though of minor importance, they tend to increase the confusion already sufficiently confounded regarding the circumstances of the discovery and removal of the statue. Such are, for example, his assertions that there was no French ship-of-war in the harbor of Melos when the statue was discovered, and that it was Dumont d'Urville who rescued it for France. As M. Reinach's letter may not be accessible to all your readers, perhaps there are some among them who would be glad to know how much has actually been determined with regard to this portion of the disputed questions, and why it is that the new evidence—which has been extensively repeated and accepted by the press of this country—is not accepted by special students of the subject.

This evidence, as Mr. Stillman stated, is an extract from the diary or notebook of a French midshipman, M. de Trogoff, said to have been attached to the *Espérance* in the spring of 1820, when she was cruising in the Levant. It is held to prove two points: first, that the statue was discovered, not on the 8th of April, the date generally accepted, but between the 4th and 11th of March preceding; second, that, when discovered, it still retained the arms. The question of the date is not of vital importance, perhaps, as it makes little difference now whether the statue was found in March or in April. Still, if it can be settled, it would better be, especially as the correctness of one statement affects the validity of the whole of M. de Trogoff's testimony. In his notebook he writes that the statue was discovered by a Greek peasant "lors de notre relâche à Milo." He gives no date, but the log-book of the *Espérance* shows that she was at Melos from March 4 to March 11; hence the conclusion is supposed to be obvious and incontrovertible — the statue must have been brought to light a month earlier than has been hitherto supposed. But in reply to this it is to be said that, admitting the Trogoff document to be genuine—and, so far as the Venus is concerned, I see no reason for wishing to doubt this—it bears numerous indications of having been written some time after the event it describes, and of having been written from hearsay rather than personal inspection. In speaking of "notre relâche," the writer may have referred to the squadron to which he belonged, not to his own ship, as the other two ships of the squadron, the *Lionne* and the *Estafette*, did remain at Melos after the *Espérance* had sailed away, and were both there April 8. This is proved by documents in the French naval archives, quoted by Reinach.

Whatever may have been Trogoff's meaning, the authority for the date generally accepted is much more satisfactory and convincing. On April 10 the *Bonite* joined the two ships at Melos; its Captain, M. Dauriac, was shown the statue, and on the 11th he wrote to the French Consul-General at Smyrna, telling him about the statue, and stating that it had been found three days before. This letter has been published several times. It was evidently written to support the request of the Vice-Consul at Melos, M. Brest, that measures might be taken to secure the statue for France; for on the following day Brest wrote to the Consul-General to the same effect. In his letter he said that the statue had just been found ("Un paysan vient de trouver," etc.). Knowing the anxiety which he displayed until it was actually on board a French man-of-war, it is impossible to believe that he would have waited a month or more before reporting its discovery to his superior; and his letter, therefore, serves to give what support may be considered necessary to the explicit statement of M. Dauriac, made as soon as he had been informed of the facts. The Trogoff statement is too vague to affect such evidence as his.

Turning now to the subject of the arms, the Trogoff document says, "Elle [the statue] est bien conservée. Dans une de ses mains elle tient une pomme." The publisher of the document accepts this as evidence that when the statue was found the arms were intact, and thus revives a story which was supposed to have passed into the region of legend, namely, the account of one Matterer, said to have been a seaman on the *Estafette*, who described in tearful language an engagement which he had witnessed between the French sailors who were sent ashore to take possession of the statue, and the inhabitants who refused to let it go. This Matterer statement was worked up in the columns of *Le Temps* by an energetic correspondent in 1874, but it is now generally suspected of being an early specimen of modern "fake" journalism. At all events, the charge that it was spurious has been seriously made, and, so far as I am aware, never successfully refuted.

But assertion is not proof, and it therefore remains to be shown again why neither this nor any other statement which implies that the arms were broken off after the discovery of the statue, can be accepted in the face of the evidence we possess. The statue was found April 8, the upper and lower half being separated. The letters of the period following—which will be found in Ravaisson's later essay, "La Vénus de Milo," 1892—show that the upper half was removed immediately to a neighboring hut or stable; the lower remained some time in the place where it had been found. The Vice-Consul receiving no authority to buy the statue, and the French ships having sailed away, it was disposed of by the peasant who found it to the primates of the island, their intention being to send it as a gift to a powerful official at Constantinople. For this purpose it was carried down to the shore on May 10. M. Brest succeeded in dissuading any captain from consenting to ship it, and thus delayed its departure until May 23, when, as a Ragusan trader was about to receive it, the *Estafette* returned, bringing M. de Marcellus, secretary of the French Ambassador at the Porte, with orders to purchase it for his chief. According to Marcellus's account, the negotiations were entirely peaceful, and two days later he sailed away with his prize. As the dates given are matters of history, it will be seen that if the arms of the Venus were broken off in an encounter between French sailors and Greeks, this could not have been before May 23; if they were broken in carrying the statue down to the shore, this must have been May 10. Of any dispute or rough handling before that time there is no mention on any side.

There are, however, positive statements that the arms were broken before either of these dates—in fact, that they were not on the statue when it was found. In M. Brest's first letter, that of April 12, referred to above, he says the statue "est un peu mutilée; les bras sont cassés." On the 19th of April, Dumont d'Urville, Ensign of the *Chevrette*, which arrived at Melos a few days before, saw the statue, and subsequently wrote a long account of it, in which he states that "elle représentait une femme nue, dont la main gauche relevée tenait une pomme, et la droite soutenait une ceinture habilement drapée; . . . du reste, elles ont été l'une et l'autre mutilées, et sont actuellement détachées du corps." Finally, we have the testimony of the drawings of M. Voutier, a cadet on the *Estafette*, who actually witnessed the discovery, being only a few yards away when it was made, and who sketched the statue before his ship left Melos. His sketch is published in Ravaisson's essay, and shows that the condition of the arms was precisely as we see it to-day. The left hand holding the apple was not a myth, however; it was found with the statue, carried to Paris with it, and is now in the Louvre.

The testimony of M. de Trogoff's diary is, then, not so important as its publisher would have us believe, and is evidently not that of an eye-witness of what he describes. If he was on the *Espérance*, he could not have been at Melos when the statue was discovered, nor could he have seen it before it left the island, by which time all are agreed that its arms were broken. The old evidence upon which the history of the statue is based remains unshaken, although the newspapers are hardly to be blamed for seizing upon whatever appeared to be a final solution of any of the vexed problems which have grown up about the statue, the most popular as it is the most mysterious of all the works which Greece has left us.

EDWARD ROBINSON.

BOSTON, February 22, 1897.

AN AMENDABLE CRITICISM.

TO THE EDITOR OF THE NATION:

SIR: There is an article, in Professor Skeat's *Student's Pastime*, devoted to the expression *darkling;* and very different it is from what one would expect to be offered, even by a philologist of no more than ordinary circumspection and research, as a contribution to knowledge. The gist of that article is as follows:

"Please note that *darkling* is an adverb. Keats is quite wrong in using it as an adjective; perhaps it was a beautiful word to him, because he did not clearly understand it."

This first appeared in 1887, in the pages of *Notes and Queries*, and was reprinted a few months ago.

In partial discrepancy from what is quoted above, Professor Skeat says, in his Introduction, p. lxxvi:

"Keats seems to have been under the impression that *darkling* is a present participle; but let us charitably hope that he knew it to be an adverb."

The *Oxford Dictionary* Professor Skeat is so gracious as to speak of, at page 320 of his new work, as "a book which, with all its faults, is by far the best dictionary we possess." "With all its faults," it is, however, a book from which he has something to learn about *darkling*, a word dispatched by Dr. Murray in 1894.

The adjectival use of it in Keats is, as has been seen, apparently held, by Professor Skeat, to be, if not unique, at all events a monstrosity, and noticeable merely by way of warning and to point a sneer.

Paul Whitehead, in 1739, sang of "a doleful tenant of the *darkling* cell"; and, on turning to my notes, I find that, a few years later, or in 1752, Dr. Johnson, in the motto to No. 7 of the *Rambler*, second edition, wrote, translating from Boethius:

"On *darkling* man in pure effulgence shine,
And cheer the clouded mind with light divine."

To Keats, it has been surmised, as we have

seen, *darkling* may have been "a beautiful word," "because he did not clearly understand it." And how as to Dr. Johnson? Were he and Keats "both in a tale"?

After altering Prof. Skeat's "because" to "and," even if we acknowledge that the two authors are to be bracketed with relation to *darkling*, still their desert is the contrary of depreciation. Though Dr. Johnson "did not clearly understand" the word, as will be shown presently, yet Keats, not impossibly, when he used it as he did, was quite aware of what he was doing. Who is to say that he did not wittingly follow, with respect to it, in the footsteps of his predecessors in his craft? To return to Dr. Johnson, inasmuch as, so far as has been ascertained, he was preceded only by Whitehead—whom he styles "a small poet"—in venturing the adjective *darkling*, it is interesting that he is, with some probability, to be credited with its effective introduction into our phraseology. However misapprehensively innovated, it was, no doubt, as to Keats, so to him, "a beautiful word"; and so, in poetic diction, it is generally considered to be, unbeautiful as it may be in the judgment of Professor Skeat.

On *darkling*, as employed in the quotations given in his *Dictionary*, Dr. Johnson, in his ignorance, is reduced to speculating that it is "a participle, as it seems, from *darkle*, which, yet, I have never found; or, perhaps, a kind of diminutive from *dark*, as *young*, *youngling*." As used by Shakespeare, Milton, and Dryden, most dictionaries, down to this hour, erroneously call it an adjective. That, in recent authors, it is frequently so is not to be disputed. And why, as adjectival, should it not be as good as, to go no farther, *now* and *then*, for instance, put attributively, were to our forefathers?

To Dr. Murray we owe the information that, among those who have used *darkling* at variance with its original acceptation, are, besides the authors already named, Shenstone, Hurdis, Gilbert Wakefield, Sir Walter Scott, Dr. Chalmers, Matthew Arnold, Mr. George Meredith, Mrs. Oliphant, Mr. P. H. Gosse, and Mr. J. R. Lowell. And this list I could amplify from my own verbal stores.

The verb *darkle*, now nearly a century old, concerning which, also, Dr. Murray enters into full particulars, has eluded Prof. Skeat's observation; and likewise has *darkling*, as its participial adjective. The first occurs in Thomas Moore, Byron, Thackeray, William Morris, and others. And, except for a narrow range of reading, or an irretentive memory, to whom is it unfamiliar? For the rest, viewed analogically, it is nothing strikingly peculiar. To many verbs, up and down our language, we find *-le* suffixed, to the production of derivates neither diminutive nor frequentative, appreciably; among them being *croak*, *gab*, *grunt*, *hug*, *just*, *ming*, *ring*, *scuff*, *start*, *ting*, *tink*, *touse*, and *twink*. Why not, then, *darkle* from *dark*, to be accounted simply a euphonic elongation of it? Or why not justify it, theoretically, as a back-formation from *darkling*, on the analogy of *grovel*, from *groveling*?

By misleading deliverances like that on *darkling*, Prof. Skeat puts his reputation to the touch. He is much too prone to precipitancy. It often really looks as if he supposed that, because of his proficiency in the English of ancient days, bare intuition was well-nigh adequate to acquaint him with the English of modern days. In none of his various productions are there tokens that, otherwise than through the medium of dictionaries and glossaries, and these consulted insufficiently, he has explored our literature of the last four centuries to any but a moderate extent, just as it has been explored by thousands of living students who advance no pretensions as philologists. Throughout his *Etymological Dictionary* this fact is patent; and very noticeably does it detract from what might, under other circumstances, have been its value. Greater still might have been its value if it had not been compiled, as it avowedly was, against time; and no one can estimate what its value might not have been, if it had not been compiled prematurely. Single-handed drudgery could accumulate but a minute fraction of materials equal to those at the service of Dr. Murray and Mr. Bradley; and, with the scanty relevant materials that Prof. Skeat had at his command, nothing better than the indifferent success which has attended his etymological labours could have been anticipated. Nor has it escaped the inquisition of the curious, that his hold on scientific principles is neither firm nor steady, and that his logical faculty is not of an eminent order. To no competent person who, for a few hours, examines, side by side, his *Etymological Dictionary* and the *Oxford Dictionary*, will the conclusion be avoidable, that, as concerns the treatment of the history and derivation of our vocabulary, the latter, "with all its faults," is, beyond comparison, superior. Moreover, the *Etymological Dictionary* being by much the most important of its author's publications, and being what it is, especially with its strange attitude towards suffixes, little does it become him to assume, as is his wont, towards his fellow-philologists, an air of magisterial patronage. No one, he should bear in mind, abases himself by modesty and generous appreciation. Of these things one might, under ordinary conditions, feel constrained to content oneself with vague intimations, or with none at all. But the subject of the present remarks, censorious at every other turn, sets no example of reticence; and what is permissible to a critic is not impermissible to a counter-critic.

F. H.

Marlesford, England, February 9, 1897.

TOAD AND TOADY.

To the Editor of The Nation:

Sir: I was looking over an old edition of Bunyan's 'Pilgrim's Progress' the other day, and, in the "Author's Apology for his Book," came across these lines:

> "If that a pearl may in a toad's head dwell,
> And may be found too in an oyster shell."

Turning to the 'Century Dictionary,' under *Toad* I found the following: "The fable of the jewel in the toad's head may have some basis of fact in the piece of glistening cartilage which represents an unossified basioccipital." Such glistening substance would hardly suggest a pearl, however. Does Bunyan in this line represent the common form of the superstition?

Can you tell me how the word "toady," as used for example by Thackeray in his 'Book of Snobs,' originated? What is there in the habits or appearance of the ordinary toad to suggest any disposition on his part to raise himself by unworthy methods to a station superior to that allotted him by a wise Providence?

I have had unusual opportunities for observing toads. A great multitude of them dwell under my barn, and I have found them in every way eminently respectable tenants. Though I possess unusual opportunities for advancing or retarding their fortunes, they have never to my knowledge approached me in the attitude of sycophants or flattered me in any manner whatsoever. Their life for the most part seems to be one of great leisure and dignity—*otium cum dignitate*.

Charles Edward Stowe.

Simsbury, Conn., February 27, 1897.

[*Toady* would seem to be connected immediately with *toad-eating*. See both illustrated in one scene in Cruikshank's 'Sketch-Book.'—Ed. Nation.]

Notes.

Charles Scribner's Sons have in press 'Philip and Alexander of Macedon,' by Prof. D. C. Hogarth of Oxford; 'A Short History of Mediæval Europe,' by Prof. Oliver J. Thatcher of the University of Chicago; 'Martha Washington,' by Miss Anne Hollingsworth Wharton; 'The Builders, and Other Poems,' by Dr. Henry van Dyke; and 'A Story-Teller's Pack,' short stories by Frank R. Stockton.

Further announcements by Macmillan Co. are 'The Port of Missing Ships, and Other Stories of the Sea'; 'A Manual of Coach Building,' by John Philipson; and Temple Scott's 'Book Sales of the Year 1896.'

Henry Holt & Co. will speedily issue 'The Fern Collector's Handbook and Herbarium,' by Miss S. F. Price; volume ii. of Prof. E. Aubert's 'Littérature Française'; and 'In Plain Air,' by Mrs. Cabot.

Prof. Trent's 'Southern Statesmen of the Old Régime' is on the point of being issued by T. Y. Crowell & Co.

Edward Arnold will have ready on March 5 'Through Unknown African Countries: The First Expedition from Somaliland to Lake Rudolf and Lamu,' by A. Donaldson Smith, M.D., with nearly thirty full-page plates and other illustrations, and five original maps, with a full index. The author is an American.

T. Fisher Unwin's spring announcements include 'The Works of Charles Keene,' with introduction and notes by Joseph Pennell; 'The Printers of Basle,' being the autobiographies of Felix and Thomas Platter; 'The Welsh People,' their origin, language, history, and present characteristics, edited by Prof. John Rhys; 'Pioneer Work in the Alps of New Zealand,' by Arthur P. Harper; Taine's 'Travelling Notes in Southern France'; 'Turgeneff and his French Circle,' a series of letters to Flaubert, George Sand, Zola, etc, edited by M.-H. Halpérine-Kaminsky; 'South Africa as It Is,' by F. Reginald Statham; 'The Inner Life of the House of Commons'; 'Communism in Middle Europe in the Time of the Reformation,' from the German of Carl Kautsky; 'Frederic Engels, Co-founder of Scientific Socialism'; 'A Village Politician,' the life story of John Buckley; 'The Life of Sir Henry Parkes'; and 'St. Mark's Indebtedness to St. Matthew,' by F. P. Badham.

Students of early English will rejoice to learn that Mätzner's great Dictionary, the publication of which has been suspended for nearly six years, in consequence of his death, is now resumed, with every prospect of a speedy completion. The present editor, Hugo Bieling, associated with Mätzner in the earlier portions of the work (from F on), is abundantly qualified for his task. The present

fasciculus, pp. 305-464, runs from *makien* to *merien*. From the brief statement on the cover, we learn that Bieling's exclusive responsibility begins with *marchen*, p. 348. It would perhaps be over-sanguine to expect the completion of the *magnus opus* by the end of the century. S and W, as the Germans say, are ugly chapters. But we hope for only a brief waiting after 1900. Meanwhile we welcome the new editor heartily.

While we can hardly think the continuator of the late Prof. Alexander Johnston's 'American Orations' (Putnams) of equal rank with that scholar and student, his insertions and additions, involving a fourth volume, will be found convenient for reference. The necessary condensation when, as in volume iv., twenty orators are presented in 400 pages of moderate size and open type, quite spoils the newer volumes for rhetorical enjoyment. Omitted passages are generally summarized in the appendix.

A tenth edition of Bartholomew's 'Pocket Atlas of the World' (Putnams) is not to be wondered at. The little volume, beside one, answers a thousand questions in the broader, and even in the minuter, range of geographical knowledge with the least trouble. There are nearly a hundred and fifty maps altogether, with an index of seventy-two pages, not quite impeccable: the only entry for Sandwich Islands, for example, refers to the South Polar group. The classified list of maps in the table of contents should, in our judgment, be repeated alphabetically.

Sir E. J. Poynter's portrait fronts the titlepage of the eighteenth issue of 'The Year's Art,' 1897 (London: J. S. Virtue & Co.; New York: Brentano's), and leads the regular array of portraits of his fellow-artists. The list has now become so considerable as to demand an alphabetical index, which is accordingly given on pp. 310-13, and covers the years 1888-96, with indication of the deaths in that period—those of last year forming a minority significant both in number and in weight. Besides the usual compact and full information respecting societies, exhibitions, etc., a record has been made of all proof-engravings and etchings of the year published under the sanction of the Printsellers' Association. Moreover, arts and crafts have found recognition in a directory of craftsmen and designers appended to the customary directory of artists proper.

The *Portfolio* for January (Macmillan) consists of a monograph on 'Albert Dürer's Paintings and Drawings,' by Lionel Cust. The illustrations are very fairly well reproduced, and are, of course, of the highest interest; but it cannot be said that the text is very valuable as containing anything new or very interesting, either as art criticism or as biography. It, however, serves its purpose as a vehicle for the illustrations in a respectable manner.

The *Quarto* (London: J. S. Virtue) is another of the new English magazines in covers which, if not so eccentric, is also not so clever as some of its predecessors. The only marked difference from others of its type which it displays is the inclusion of music in its table of contents. It has only one illustration of any great degree of merit, a photogravure after Rossetti's painting of "The Salutation of Beatrice," and contains no literature that seems above the ordinary magazine average. It is called a "quarterly," but seems, so far, to be very irregular in date of publication.

The most recent work of the indefatigable editor, Senator Luigi Chiala, is 'La Vita e i Tempi del Generale Giuseppe Dabormida' (Turin: Roux, Frassati & Co.), in which are given for the first time many documents concerning the Italian Revolution of 1848. Dabormida was both one of Charles Albert's most trustworthy generals and a member of his Cabinet in that exciting year. Prefixed to the main biography is a sketch by V. Chiala of Gen. V. E. Dabormida, who gallantly lost his life in the battle of Adowa March 1, 1896, while fighting the Abyssinians. In soldierly qualities, in loyalty to their king, and in devotion to duty, the Dabormidas were fine specimens of that best Piedmontese stock to which Italy owed, in large measure, her independence and unity.

A recent Johns Hopkins doctoral dissertation, by Constance Pessels, is on 'The Present and Past Periphrastic Tenses in Anglo-Saxon.' The writer, now instructor in the University of Texas, has studied the Anglo-Saxon texts exhaustively and tabulated the results. The chief conclusion, stated at page 74, that periphrasis is not conclusively a borrowing from Latin, or, if borrowed, was early naturalized, seems to us well established. We are not quite satisfied with the terminology "periphrastic tenses" for such locutions as "I was fighting," but should prefer to call them "periphrastic forms." Nor does it seem to us wise to adopt Sweet's definition of a "future preterite," p. 23. Occasionally the writer's expression is not as lucid as it should be. But in the main the dissertation is a bit of solid work.

Frank H. Chase's 'Bibliographical Guide to Old English Syntax,' though published by Fock, Leipzig, represents the writer's study, as Clark scholar, at Yale. It is an extremely useful little pamphlet, giving one the means of surveying the literature bearing upon the subject. The critical remarks proffered are few, but sound and suggestive. If we were to raise any objection, it would be to the writer's estimate of Wülfing. That scholar's voluminous and labored compilation seems to us faulty both in plan and in execution. But we must not make too much of a minor point in Chase's work, while commending it as a whole for precision and practical arrangement.

In *Dialect Notes*, Part ix., Prof. George Hempl of the University of Michigan makes a first report on the distribution of American dialects, using as criterion the pronunciation of *grease* and *greasy*. He has had some 1,600 sets of answers to his list of questions, and concludes that there are four dialectic sections of the country, called North, South, Midland (a belt separating the two previous divisions), and West. "The District of Columbia is peculiarly national," but is in this report classed, like Delaware, with the Midland. "In some matters Canada (especially Lower Canada) goes with the North, in others with the Midland and the South." As respects the pronunciation of *grease* and *greasy*, the North generally "strongly favors *s* in the adjective and verb." Subserviency to Walker and his lexicographical imitators has, in and about Boston, favored the use of "*s* in noun, *z* in verb and adjective," and so somewhat disturbed the general verdict. "Connecticut is the average New England as well as Northern State. For the Middle North (that is, excluding New England and the British Possessions), Iowa occupies a similar position, as does southern Iowa for the West, and middle Illinois for the Midland belt." Arkansas and most of Missouri represent the South. "Our North harmonizes fairly with the larger part of England, while our Midland, and even more our South, show distinct traces of the Scotch and Scotch-Irish ancestry of a large part of their population."

We reviewed, some years ago, a book entitled 'Kentucky Jurisprudence,' by Mr. L. N. Dembitz of the Louisville bar, in which the author successfully established his proposition that the development of law in the several States would furnish material for a corresponding number of separate treatises. The suggestion has so far, we believe, not been acted on; but in the February number of the *New Jersey Law Journal* Mr. Frederic Adams of the bar of that State points out a peculiarly interesting field for such a legal inquiry. In fact, as he observes, the public history of New Jersey is for the most part a history of law; and "a bare enumeration of the attractive features of a legal narrative that should begin with the Duke of York and end with the Duke of Gloucester" would of itself occupy no inconsiderable space.

The new first supplement to the Carnegie Free Library's Catalogue of Fiction (Allegheny, Pa.) is noticeable for its prefatory "List of Books no longer on the shelves," including Horatio Alger's, Martha Finley's, May Agnes Fleming's, "Harry Castlemon's," A. C. Gunter's, Mrs. Mary Jane Holmes's, E. P. Roe's, Mrs. Southworth's, Marion Harland's, and Augusta J. Evans's. The intrepid librarian fortifies his action with extracts from the *Nation's* reviews pointing out the inanity of many of these voluminous purveyors for the vacant mind.

An unusually interesting number of the *Geographical Journal* contains an account of an extensive journey to the north of the Zambesi by which some important gaps in the map of this region were filled. The explorers found that the memory of Dr. Livingstone was retained by many of the natives, who befriended them for his sake. Much of the country traversed was devastated by the rinderpest, and "the game now is practically extinct, the carcasses lying rotting in all directions." In some notes of a journey made for the study of the classical geography of Mysia, Mr. J. A. R. Munro describes a settlement of Russians on Lake Manias who, after centuries of expatriation, "retain their national type and customs with surprising freshness." "Their houses are neat and well kept," and "the inhabitants appear to be prosperous and contented"—and this within a comparatively short distance of Constantinople. There is also an account of a visit to the cave-dwellings on Mount Elgon in East Africa. Some are of a considerable size, with numerous passages, and are inhabited by large numbers of people, who "appear to develop a special power of sight, and run about at full speed in the dense darkness of the passages with the greatest ease and confidence." The caves are very dry, and "the attrition of human feet through long ages has worn away the rock and produced a fine floury dust" several feet deep. Some travellers have suggested that they were artificial, but Mr. Hobley thinks that they may be due to the action of water when the Victoria Nyanza was a "mighty inland sea." This and the preceding articles are accompanied by maps, and there is also a map of the Niger delta, compiled in part from a route survey by Major Crawford, one of the victims of the recent Benin massacre. Sir Clements Markham's address at the jubilee of the Hakluyt Society contains many interesting facts, especially regarding the life and work of Richard Hakluyt, to whom, as the

preserver of the records of explorers and discoverers, both Shakspere and Milton owed much.

The *Scottish Geographical Magazine* for February opens with an account of recent explorations in the Patagonian Andes, made for the purpose of determining the continental watershed and the sources of the principal streams, and to examine the valleys, which appear to be of great value both for agriculture and for cattle-raising. This is followed by notes on the geography of the Argentine Republic.

Since Miss Helen Gladstone retired from the first vice-principalship of Newnham College, in order to be with her parents during their declining years, the post has been filled by the appointment of Miss Katherine Stephen, daughter of the late Sir James Stephen. Miss Stephen's promotion to Sidgwick Hall makes room for Miss B. A. Clough, younger daughter of Arthur Hugh Clough, who succeeds as head of Clough Hall. Mr. and Mrs. H. Y. Thompson have presented the college with a new library, which is now being built; it will hold three or four times as many books as the old library and accommodate many more readers.

—Mr. Harry A. Cushing's 'History of the Transition from Provincial to Commonwealth Government in Massachusetts' is the latest issue in the Columbia University "Studies in History, Economics and Public Law." The period is one which, in many of its aspects, has been pretty thoroughly worked, but its governmental features have not, so far as we recall, received so detailed an examination as is here given them. Rightly insisting, at the outset, that the Revolution was no sudden or isolated event, but "the normal ending of years of faithful adherence to divergent policies," and of "the firm maintenance of incompatible political theories," Mr. Cushing shows how careful Massachusetts was to conform, as far as possible, to familiar law and precedent, even while constitutional principles were yielding to the stress of political necessity. As the breach with Great Britain widened, and the possibility of war became more imminent, the Provincial Congress was forced to assume increased powers of control; in so doing, however, it manifested a remarkable deference to the wishes of the Continental Congress, to which it seems to have felt itself, in a way, subordinate. On May 16, 1775, the Provincial Congress accepted a report of a committee declaring that since the condition of affairs in Massachusetts and the possibility of war "equally affected our sister colonies and us, we have declined, though urged thereto by the most pressing necessity, to assume the reins of civil government" without the advice and consent of the Continental Congress; and it was in accordance with the suggestion of that body that the government under the charter was resumed. The chapter on the Constitution of 1778 is of especial value; that on the Constitution of 1780 covers, naturally, more familiar ground. We note unimportant misprints on pages 152 and 182. The fact that Mr. Cushing's volume is one which all students of American history will be grateful for, makes the absence of an index only the more unpardonable.

—Mr. L. L. Price of Oriel College, Oxford, has collected a number of his essays, published and unpublished, in a volume entitled 'Economic Science and Practice' (London: Methuen & Co.). More definitely these papers may be described as essays on the various aspects of the relations of economic science to practical affairs. If not of very high, they are of very even, merit, being marked by moderation and good sense as well as scholarship. The author is a bimetallist, but, as he is evidently incapable of dishonesty, it is curious to observe the arguments that he finds unanswerable. Falling prices, he thinks, act powerfully on the imagination, and discourage enterprise. This is very well in theory, but if any one attempts to make out that the era since 1873 has been one of "discouraged enterprise," he has not a hopeful task. Theoretically "it cannot be doubted that employers are disheartened by falling prices"; but in spite of their faint hearts they have vastly increased the number of their workmen since 1873. It is true, Mr. Price concedes, that appearances may fail to reveal the existence of suffering on the part of the wage earner, who yet might have been much better off had it not been "for discouragement occasioned by falling prices to business enterprise." Still, Mr. Price is conscious that some more tangible evidence of the ruin caused by the gold standard might be helpful, and this he finds in "the stationary wages, the falling profit, the failure to recover from temporary depression due to credit fluctuations, and the feeling of *malaise* which has been a characteristic of business in recent years, attested by successive Royal Commissions." It may be submitted that this is not exactly evidence, in the scientific sense, and that if, as a matter of fact, the purchasing power of wages and the number of wage-earners are increasing, if production is enlarged even with a declining rate of profit, and if the volume of trade steadily swells, the disastrous effect of the gold standard remains to be proved.

—The Symbolists are still alive, and furnish matter for two volumes, one, 'Le Livre des Masques,' by Remy de Gourmont (Paris: Société du Mercure de France), the other by Jacques Plowert, 'Petit Glossaire pour servir à l'intelligence des Auteurs décadents et symbolistes' (Paris: Vanier). The latter is really a reissue of the book published in 1888. It may therefore be dismissed with this passing mention, that it is exactly what its title indicates, a glossary of terms affected by Décadents, though many of these terms are by no means peculiar to that peculiar group, nor even employed by them in any new sense. Gourmont's book is disappointing. It is an almost uniform laudation of writers who have not all succeeded in making themselves heard by the public—which is, therefore, an idiotic public. Epithets which Hugo would have loved to apply to himself, if he had only thought of them, are freely bestowed on third and fourth-rate Symbolists; they are "luminous Levites," whatever that may mean; "authentic glories of French letters of the present," and so forth. The preface is better worth reading, for it is an attempt to define Symbolism and a protest against the slavish observance of rules and formulæ, a protest to which one may heartily subscribe without necessarily sharing M. de Gourmont's admiration of the writers of his school. According to him, Symbolism is the expression, even if excessive and unseasonable, of individualism in art. What gives a value of its own to the book is the admirable work of the illustrator, F. Vallotton, whose masks of the authors spoken of are excellent in every respect.

—The first part of a 'Geschichte der isländischen Geographie,' published by Teubner of Leipzig, is the German translation of a work by the Icelandic geologist Thorvald Thoroddsen, printed (in 1892) by the Icelandic Literary Society for its members. The present volume begins with a discussion of the imagined identity of Iceland with the Thule of the ancients, and ends with a description of the cartography of the sixteenth and seventeenth centuries; a subsequent volume will bring the matter down to the present time. The author has treated his subject along the broadest possible lines. The work is primarily intended to cover everything of importance that has been written concerning Icelandic geography; but political, commercial, and social conditions, a knowledge of which is necessary to the intelligibility of early writers, have also been most carefully described in their historical development, and literature and *Culturgeschichte* have received an unexpected share of attention. This is especially worthy of note, since for a great part of the time under discussion but little has hitherto been done. The earliest period of the history of Iceland, thanks to the phenomenal literature of the Classic Age, has been most minutely investigated. With regard to conditions after 1300, however, as the author points out in his preface, there is still almost complete darkness, although plenty of material is at hand in documents and manuscripts which are the sources of some of the present material. That the work was originally written for an Icelandic public, and not for the specialist, has in no wise invalidated its interest or its usefulness.

—A report of unusual interest has lately been issued by the Public Works Department of the Government of India, concerning the great landslip at Gohna on a head branch of the Ganges in the Garhwal Himalayas, in September, 1893, and the precautions taken to lessen danger when the lake formed by the slip overflowed in August, 1894. The slip descended about 4,000 feet; successive falls continuing for three days with deafening noise, the air being darkened with dust from the 800,000,000 tons of shattered rocks. A dam was formed across the narrow Birahi Ganga valley, behind which a lake at once began to rise. It was hopeless to cut a passage through the dam. As the flood anticipated when the lake overflowed could not be controlled, effort was turned to warning the people in the valley below. A telegraph line was constructed from Hardwar, where the Ganges emerges on the plains, to the lake, 150 miles away in the mountains. Iron suspension bridges were dismantled and removed and replaced by temporary rope bridges for the use of pilgrims, who resort in great numbers to the sacred valley. Safety pillars were set up in plain sight at frequent intervals along the valley-side, to indicate the probable height of the flood. In April, 1894, predictions based on the rate of rise of the lake waters gave August 15 as the date of overflow and discharge. The flood actually happened at midnight, August 25–26, during heavy rain. In four hours the dam was cut down 390 feet; the lake was reduced from four to two miles in length, and from half to a quarter of a mile in breadth; ten billion cubic feet of water was discharged. The flood rushed down the valley at a rate of twenty miles an hour just below the dam; its advance was reduced to ten miles an hour at Hardwar. The water generally rose well up to the safety pillars, one or two hundred feet above the ordinary channel; its increase was nicely recorded even at night by the successive extinction of lanterns that had been lighted on posts set up at ten-foot vertical intervals at

a number of points along the doomed valley. Two bridges that had been left standing, after protest by the local authorities against their removal, were swept away. Many miles of valley road was obliterated. All vestiges of habitations were destroyed at three considerable towns and many small villages. Yet so completely did the telegraphic warnings from the lake serve their purpose that not a single human life was lost. The officer in charge of this beneficent work was Lieut.-Col. R. R. Pulford.

PATER'S UNFINISHED ROMANCE.

Gaston de Latour: An Unfinished Romance. By Walter Pater. Macmillan. 1896.

Mr. Shadwell informs us that this little volume is the last we may expect from his gleanings of Mr. Pater's uncollected work, and the last that was left in fit condition for publication by that careful and elaborate workman. The greater part of these seven chapters appeared in *Macmillan's Magazine*, and hence will be new to many readers on this side of the water. To say that the work is an unfinished romance need not disappoint readers who are familiar with Mr. Pater's methods; each chapter is a vignette which is self-sufficing in its individual beauty and interest.

Gaston de Latour is a second Marius, transferred to the sphere of modern thoughts and ideas. Mr. Pater has chosen France for his scene, just at the time when the Renaissance and the religious wars made it a vortex of mingling currents and movements in art, philosophy, and religion. Gaston's birthplace is an old château, in the fertile plain of La Beauce, the country of Joachim du Bellay, over whose wide landscape the Cathedral of Chartres "shows like a ship for ever a-sail in the distance." He is the last of a long line of gentlefolk, who had infused something of their blood as well as of their gentility into the neighborhood, and left their impress upon its character and manners as well as on the landscape. Their château of Deux Manoirs, embodying in the peculiarity of its architecture an episode of family affections, is one of those places which the genius of Mr. Pater loved to haunt and to adorn with fanciful and touching retrospect such as we meet with in 'The Child in the House.'

Here, in the family chapel of St. Hubert, the young seigneur is first presented to us. He is taking a step which might end the race of Latour; he is of his own choice assuming clerk's orders, according to the ritual of the Roman Church. Yet the old ecclesiastics of his kindred, who assist at the rite, have their misgivings; they can discern that he is not quite after their kind. The cloistered life at the Cathedral of Chartres will not extinguish certain alien and disquieting sensibilities. He suspects "somewhere in the world, waiting for him in the distance, a still living humanity, perchance already on its way, to explain, by its own plenary beauty and power, why wine and roses and the languorous summer afternoons were so delightful. . . . Sorrow came along with beauty, a rival of its intricate omnipresence in life. . . . The beauty of the world and its sorrow, solaced a little by religious faith, itself so beautiful a thing—these were the chief impressions with which he made his way towards manhood."

These passages echo the note of 'Marius' and of 'The Child in the House.' It is easy to guess with what subtle, refined, and tender touches the author of these works paints the life and atmosphere of La Beauce, the memories and associations of the old château, the routine and ceremonial of the great cathedral. There the young clerk and his fellow-acolytes pursue an unending function, "a sort of religious drama, as if one explored the entire Middle Ages." The young clerical actors in this drama were not too deeply tinctured with its sentiment and solemnity. Mr. Pater, who knew his student world in Oxford, sketches with delicious penetration the ways of this flock of sparrows in the temple—their zealous officiousness, their disdain of the untonsured laity, their profound irreverence, their worldliness and graceful fopperies, their longing for Paris and all the pomps and vanities which the Huguenots despised. "Half clerical, they loved nevertheless the touch of steel; they read eagerly in racy new translations old Greek and Latin books with a delightful shudder at their wanton paganism."

Gaston, too, had his fit of the classical enthusiasm. Like his comrades, he had taken on trust the *hortus siccus* of Virgil and Horace. It was a "docile act of faith" regarding a past that was chained to the bookshelf. But he takes his first flight into the "world of modernity" as he crosses the low hills that bound the horizon of La Beauce, and visits the convent where Ronsard, by special court favor, was acting as lay-superior. This is a second step in our Pilgrim's Progress. He had already made the acquaintance of the poet's odes, of his "Skylark," and his "Mignonne! allons voir si la Rose," "which had proved the key to a new world of seemingly boundless intellectual resources, and yet with a special closeness to visible sensuous things." Here was something new and alive, like the faces one knows and loves, as brilliant and magical as the flowers and the birds in the sunshine. Compared with the Maries and Cassandres, what were Dido and Æneas but statues in the gallery of antiquity? Why should poetry "mask itself in the habit of a bygone day? Gaston could but pity the people of the past for not being above ground to read."

Thus vividly does Mr. Pater suggest the miracle that was wrought on youthful imagination by the poetry of the Pleiad—the budding of that new spring—the awakening from the sterile contemplation of a beautiful but petrified past to the worship of a living beauty speaking the languages of the day. This new and profane religion—the worship of physical beauty, with Ronsard for its high priest—makes an appeal to the ardent young clerk that is likely to conflict with his vows and his tonsure. But he is plunged into deeper waters when the "Prince of Poets" offers him a letter to his friend Michel de Montaigne, with which he travels further south to the Gironde, "the country of peach-blossoms and wine."

The chapter on Montaigne must remain a classic on its attractive subject. In it Mr. Pater has decanted the essence of the Essays, in their discursive turnings and windings, and has managed to collect a most characteristic cento of their thoughts and phrases. All this is artfully wreathed about the individual traits of their author so as to give a nearly perfect miniature of a singular and fascinating personality. The undulancy of that philosophy into which Gaston found his mind precipitated, its "fluxions and mobility," its negative and sceptical attitude, are somewhat over-emphasized by Mr. Pater as well as by Emerson. If Montaigne thought "doubt the best of pillows to sleep on," it was a sleep from which he wakened with purged vision that saw centuries beyond his contemporaries. At his particular epoch, it really was the "greatest thing in the world for a man to know that a man is his own." His scepticism is, on its reverse side, only the assertion of freedom and independence of thought—a splendid practical assertion, which is felt in every chapter and page of his writings. His indifference, in another view, became religious tolerance, in which he was "the solitary conscience of his age." The light of common day, that shines around us all now, was then a single gleam just touching the height of that genial and elevated intelligence. His ideas on education, his condemnation of monkish asceticism, his adorable spirit of humanity, his abhorrence of cruelty to children, to criminals, and to animals—all these, which are the axioms of modern civilization, were then hardly dreamed of save by that tender heart and innovating brain. "I do not much pity the dead, and I should envy them rather; but I very much pity the dying. For my part, even in justice itself, all that exceeds mere death appears to me pure cruelty. . . . 'Tis not a soul, 'tis not a body we are training up, but a man; and we ought not to divide him. Of all the infirmities we have, the most savage is to despise our being." In sentences like these break out the light and reason of that lucid and unique spirit, like a patch of blue sky above the mists and prejudices and illusions of its tumultuous age.

When Gaston leaves Montaigne's "Castle of Circe," and visits Paris just on the verge of the massacre of St. Bartholomew, when he marries a young girl of Huguenot family by "dubious and irregular rites, the religious sanction of which he hardly recognized," the casual reader may fancy that he is at last hot on the scent of romantic passion and adventure. But Mr. Pater's admirers know quite well that this cannot be, that there is nothing of Dumas or Stevenson in his pensive and meditative pages. He is here, as in his 'Marius,' the historian of sensations and ideas, not of action, and passions, and hair-breadth escapes. It is, indeed, most striking and characteristic how, just at the moment when action might be forced upon his hero, he swerves aside and will have none of it. The healthy and happy novel-reader, who loves the drama of passion and adventure, and who regularly commits the crime of reading solely for amusement, may as well be warned that Mr. Pater will not serve his turn. Here is a romance which offers no action, no conversation, no love-making, no adventures greater than the surprise of meeting with a great poet or a famous philosopher. On the eve of the massacre Gaston is summoned to his grandfather's deathbed; his young wife, with her unborn child, flees into the country, believing herself deserted and betrayed, at the most poignant moment, and so disappears. Instead of the massacre itself, we have a fine allusive description of the atmosphere of horror and delirium, of mystery and wild surmise, that overshadows it; in the midst of this, a single tragedy is hinted at, and then vanishes into melancholy haze.

The thread of personal experiences which in 'Marius' was never lost, is firmly held in the early chapters on the boyhood and nurture of Latour; it is retained in the chapter on Ronsard, who is felt and seen through the fancy and the eyes of his youthful and poetic worshipper; it reappears rarely in the essay on Montaigne, it disappears completely in the chapter on Giordano Bruno. Perhaps it was the consciousness that he had lost his hero which broke off this vein, and left us only a

fragment. Be that as it may, Gaston here simply poses as a listener to introduce us, one Whitsunday afternoon, to an address *de umbris idearum* by Giordano Bruno, that Dominican brother whose philosophy was just then one of the new-fangled Italian fashions made welcome at Paris. But the listener drops out of view altogether, and instead we are offered the personality of the philosopher.

There is something in the method of its presentation which recalls the unity of purpose, the continuity of interests and studies, which run through all Mr. Pater's work. The essay on Joachim du Bellay was published in 1872; the poetry of the Pleiad, the wide landscape and the fertile fields of La Beauce, the winnowers' song and the winnowing fans took hold of his fancy, and it is to those scenes that he reverts nearly twenty years later for the birthplace of his hero, Gaston de Latour. He was always fond of philosophy, but of philosophy only as embodied in or shining through a personality. In his Sebastian Van Storck he personified or dramatized Spinozism. "Philosophy," he wrote in his essay on Winckelmann—"philosophy serves culture, not by the fancied gift of absolute or transcendental knowledge, but by suggesting questions which help one to detect the passion and strangeness and dramatic contrasts of life." It is from this point of view that he looks at Plato; it is from the same that he gives us those rounded and vivid and colored pictures of Montaigne and Giordano Bruno.

"The spiritual unity of the world" which Bruno preached "must involve the alliance, the congruity, of all things with one another, of the teacher's personality with the doctrine he had to deliver—in hearing him speak you seemed to see that subtle spiritual fire to which he testified, kindling from word to word. In Bruno that abstract theory of the perpetual motion of the world was become a visible person talking with you."

The same thing, *mutatis mutandis*, may be said of our author, as we listen here to the last vibrations of his musical voice. He and his philosophy were all of one piece. He was endowed with that keen sense of form and sounds and scents and colors, and of their impression on the emotions and the soul, which transcends the gamut of ordinary experience, and is the special heritage of the poet and the artist. This exquisite and perilous sense, which in most of us fades after childhood, and in many is dulled and perverted to gross abuse, he kept to the last so fresh and pure and true that he showed how it might ally itself with religion—that he bridged in a Platonic manner the passage from the beautiful to the good, from the perception of ideal beauty to the conscience of the good. He showed how this refined epicureanism, the enjoyment of select and noble pleasures, of the most refined sensations and emotions which the fleeting moment can offer, may ally itself in the end with morality, with the beauty of holiness. Finally, he interpreted this sense with the most vivid fidelity, and with a literary craft whose beauty and conscientious finish were born of his creed. If such doctrine seems esoteric, a cult reserved only for the initiated few, it is none the less a counsel of perfection—a goal towards which human nature must press and aspire if it is destined some time "to let the ape and tiger die." It is a doctrine that above all needs preaching to a gross and materialized democracy like ours, to the Caliban or the plutocrat who is the true *Epicuri de grege porcus*. And hence these highly wrought essays have a real message to deliver and a real niche to fill in the temple of art and humanity.

ENGLISH RHETORIC AND COMPOSITION.

Constructive Rhetoric. By Edward Everett Hale, jr. New York: Henry Holt & Co. 1896.

Talks on Writing English. By Arlo Bates. Boston: Houghton, Mifflin & Co. 1896.

THE term Constructive Rhetoric seems to be used by Mr. Hale, not in opposition to analytical rhetoric, but to indicate that he wishes to analyze the art of composition for constructive purposes—to use the materials of rhetoric to teach students how to write. He is professor of rhetoric and logic in Union College, and no doubt his book illustrates his own method of teaching. This may be described, briefly, as consisting of an explanation of the principles underlying the art of writing, accompanied by exercises in the application of the principles. For instance, Part I., which treats of kinds of composition (narration, description, exposition, and argumentation), after explaining them, gives a number of subjects, *e. g.*, Autumn Weather, The Decay of Political Honesty in Republics, and The Oratory of Burke, and asks the student to determine by what kind of composition each should be treated. This part of the book is simple, and contains many useful and, we believe, some original suggestions. Beginners not only have few ideas, but they are totally unaccustomed to reflect upon or analyze their own mental processes, or to consider the fitness of a particular rhetorical means to an end. Most people remain in a fog about this all their lives. A student doing the exercises in Part I. could but find his literary powers strengthened by them. What the author says about the mistake of "realists" who imagine that a catalogue is good descriptive writing is excellent, and so is his analysis of a passage from Scott illustrating the fact that description which follows the order of sequence of original observation is apt to be good. The rationale of this matter we take to be that the method in question reproduces for the hearer the *impressions* made on the observer, exactly as they were produced, *i. e.*, the natural order. In modern descriptive writing we are often annoyed by the writer's undertaking to invert the order and force an unnatural sequence of impressions. The result is always fatigue and revolt.

Part II. the author calls "The Paragraph," and it is here that we begin to get a clearer insight into his system, the object of which is to fix the mind primarily on *structure*. It would perhaps be a caricature of a book which contains much that is valuable to say that Mr. Hale's ideal in composition would be an ideal of form without content; but his method of treatment strongly suggests this. Illustrations may be found at every turn. Even in Part I. he shows his devotion to form by suggesting to the student in narration to write the end of his story first, because the end "makes the final impression," and "one should have it in mind all through." And so at p. 157: "Wishing, then, to end our paragraphs with the very best effect, we will think particularly what sort of effect we can give by manipulating the thought, and then what effect we can give by manipulating the style." A better practice, however, he thinks, is "writing beginnings." So we hear nothing about simplicity and clearness, the two essentials of all good elementary composition, till we reach a postscript to Parts I. and II., where they are described as intellectual qualities of style; the next mention is at p. 253, where, under Simile, we are told that, "if simplicity be our aim," "one form of synecdoche may to some extent take the place of example in other kinds of composition." When we have examined all that the author has to say about simplicity and clearness, we cannot help thinking that he regards them as almost figures of speech. A great deal of the book can be of little or no value except to very advanced students or expert rhetoricians. The tendency of much of it is to make the pupil mistake form for substance.

The fallacy which underlies what we object to in the book consists in the idea that the *art of writing* can be taught by means of what the author calls constructive rhetoric. Our experience is that the teacher can do very little beyond practising the learner in the expression of such ideas as he has (and they are usually not numerous), and that the system expounded by Mr. Hale, blindly followed, would inevitably produce, not good, but highly artificial writing. A curious instance of the effect upon himself of the author's devotion to form occurs at p. 278, where he declares that, by antonomasia, a boy who has accumulated more marbles than all his schoolfellows put together may properly be called "the Jay Gould or the Rothschild of this spherical currency." Yet on the next page he says, speaking of two other figures, "I do not believe that anybody was ever yet taught outright to speak ironically or to make good epigrams."

Those who have never had anything to do with writing or teaching others how to write, would be surprised to find how few beginners have any idea about the matter. One of the most invaluable accomplishments in practical life is the art of being able to reproduce a document or piece of writing of any kind in a condensed form. In any profession or business it is of the first importance to know how to do this. Without expertness in it, dispatches and letters cannot be abstracted, cases cannot be prepared for trial, news cannot be summarized for a newspaper. Yet expertness in it is very rare, solely from lack of early training. We believe that it ought to be taught wherever writing is taught; when learned, it is at once perceived to be a matter of substance, not form, and most people have to learn it for themselves. A student with this one thing for his equipment will, we believe, be ready for work, though he may have hardly a speaking acquaintance with metonymy or antonomasia, and never have heard of obverse iteration or anti-climax. Mr. Hale, far from recommending exercises of this sort, seems even to object to abstracts. He recommends "making analyses of the paragraph structure of other people's writing," but expressly says: "Don't try to make an abstract of the essay or whatever else you are at work on" (p. 117).

Our author, though so strong an advocate of form and rule in structure, is somewhat indifferent where diction is concerned. He seems to think that the student is more often at a loss for *some* word to express an idea than in difficulty as to the correct word (p. 187). This may be, but we believe that the reason is usually connected with lack of ideas rather than words. We have seldom met with anybody plentifully supplied with ideas who had not also a large vocabulary of some sort. Many young people have feelings and

emotions which they long to express and cannot find words for, but feelings and emotions are not ideas. And why are not purity and propriety of diction and correct usage of just as much importance as correctness in style? All students are warned against mixed metaphors, though, as Mr. Hale points out (p. 260-1), any metaphor which introduces terms of both idea and image must be mixed, while on hearing the stock classical instance, "to take up arms against a sea of troubles," we are not disturbed, though the metaphors are absolutely incongruous. He would not, however, on this account recommend or teach the mixture of metaphors. Is there any reason for allowing a greater degree of slovenliness with regard to diction? Yet this seems to be at bottom Mr. Hale's idea, and the tendency of his book is accordingly to encourage the student to think that if he is correct in structure, he need not mind being slovenly in diction – which is surely a great mistake. He suggests (p. 243) that a class of men exists—*e. g.*, Walt Whitman—to whom it is "necessary" to "dismiss the care for good English from their minds and surge ahead." To tell this to a student is to mislead him. The student always has a tendency to think that rules are made for others, but that his is a peculiar case. The object of teaching is to show him that good work is possible only under rule. The important thing for him is to find out what good usage is, not to have it preached that good usage is always changing (p. 65), and that the usage of one century is not that of another. The fact is true enough, but it is of almost no help to any one learning how to use language. We live in a period of slovenly writing, and to direct the attention of students to the great evangelist of slovenliness, disorder, and barbarism, as if he belonged on this account to an acknowledged class of great writers, is all the more pity. The fact that language and usage are always changing is the very reason why correct usage is of so much importance. The author cites Campbell as an authority on the principles of good usage, and says "he is as valuable as ever." This means that good usage must be that of the present age, must be reputable, and must not bear the brand of locality, technicality, or provincialism. No one will quarrel with this, except those who think it necessary to dismiss the care for good English from their minds and surge ahead. But its importance needs to be emphasized, not minimized.

There is between Mr. Hale's 'Rhetoric' and Mr. Bates's 'Talks' (given in 1894 as a course in the Lowell Free Classes) a certain family likeness. One is a treatise, and the other a collection of conversational lectures, but both writers belong to the same school; in the teaching of both we detect the haunting influence of the same professional ideal—that of composition taught formally, as if without content or substance, as by instructors desiring to produce a perfected rhetorical man, skilled in all the arts of expression, but freed from the incubus of ideas. No doubt both of them would repudiate, as a travesty, any such description of their aim, and to be quite accurate we should perhaps say that such books suggest this as a sort of esoteric ideal, not to be rashly proclaimed in public doctrine, but to be cherished by the initiated and tentatively adumbrated to the neophyte. Mr. Bates, for instance, is for ever reminding us that writing is very like playing on the piano. A girl learns to play the instrument without composing music, and five-finger exercises are to musical composition what rhetoric is to writing. In both the student "must not think of what he is doing, but of how he is doing it" (p. 23). For the same reason, "it is well, in learning to write, to select uninteresting subjects," themes "which depend for their effectiveness not upon what they are, but upon the way in which they are presented" (p. 26). Mr. Bates regrets to find that students tend "to set to work to find something to write about which is in itself attractive," and declares that, do what he will, it is difficult to persuade them to stick to "careful attempts to express the commonplace."

All this does not prevent Mr. Bates from making sensible remarks about writing, but it leads to one very extraordinary consequence. Departing from "the time-honored custom of putting description and narrative before exposition and argument," he insists that exposition and argument shall come first. One of his principal reasons is that the pupil, in describing something or telling a story, is in danger of becoming interested in what he is about, and this emotion of interest may distract his mind and obstruct his progress in the cultivation of skill in form and technique. Have not the great performers on musical instruments been for the most part "trained technically while they were still so young or so undeveloped that the emotional capabilities of their nature were not matured?" (p. 125). It is an old saw that a metaphor proves nothing, but to this Mr. Bates does not agree where the piano and rhetoric are concerned.

Both Mr. Bates and Mr. Hale seem to have been curiously misled by some advice given by Flaubert to Maupassant (p. 24). The latter is very justly described as "one of the most finished masters of literary art, pure and simple, who have written in this century"; and Flaubert gave him some advice, in a whimsical vein, which Maupassant has reported. It does not follow from this that Flaubert's advice produced Maupassant's style, and, as a matter of fact, it did not. Maupassant would have us believe that Flaubert taught him "the way to become original." But this was precisely the one thing which the elder novelist could not teach the younger. The passage quoted is an extravagant and thoroughly French overstatement of the fancy that the essence of genius lies in an immense capacity for patient toil. If Maupassant were taken literally, it would mean that Flaubert taught him that by staring long enough at a familiar object, he would see in it something which no one had seen before. Whatever Flaubert taught Maupassant, it was certainly not his own method. For writers of English, Hawthorne's notebooks convey the lesson and record the results of painstaking literary practice much better than Maupassant's curious interpretation of French realism. Hawthorne is quoted (p. 238) as having declared the secret of his own style to be "the desire to tell the simple truth as honestly and vividly as one can." This is utterly different from trying to see something in an aspect that nobody has noticed before.

Authors and Friends. By Annie Fields. Boston: Houghton, Mifflin & Co. 1896.

It is a happy fortune which enables us to see so many writers of the famous Boston coterie through the eyes of an intelligent, cultivated, and sympathetic woman, whose opportunities for knowing them were of the best. Mrs. Fields did not know them merely as the acquaintances and friends of her husband, James T. Fields, publisher and man of letters, but clearly, in several cases, in her own right as much as his—Mrs. Stowe and Mrs. Thaxter and Whittier, it would seem, much better, partly because her friendship with them went on and grew after her husband's death. Not unmindful of the privilege of such high companionship, there is no boasting as of the vase that it had been with the rose, and still less any deliberate suggestion of the peace and comfort which these authors and friends found under her hospitable roof. But the suggestion is no less evident because unconscious. It was inevitable, and one of the most beautiful things in Mrs. Fields's book is the reflection of her husband's cheerful kindness as a literary host, and her own perfect sympathy with him and intuitive coöperation. In and between the lines of the letters given here from one friend and another we have glimpses of the writer's personality quite as attractive as any she affords of those whom she esteemed so much. The scope of her book is not commensurate with that of Boston authorship. One of the greatest names is missing from the table of contents—that of Lowell—and why this happens is a problem which the curious psychologist will not refuse to entertain.

All these chapters, except the brief concluding one on Lady Tennyson, had previously appeared in print, though in some cases less adequately than here. The treatment varies not only with the subject, but also with the author's method of approaching it. The "Longfellow" is a biographical sketch in which Mrs. Fields avails herself of varied help, and is most happy when relying on her personal impressions. The delightful quality of these is substantially the same as that of others which have been published by Longfellow's friends. Sometimes the note impresses us as somewhat exaggerated or even false, as where it is said that "he was first of all a seer of beauty in common things." Hardly could anything be further out than this, and to speak of his life, as a whole, as being "crowded with incident and experience" is equally beside the mark. A more favorable impression is given of Longfellow's wit and humor than we have commonly received. On one occasion he "scintillated all the evening," but this is set down as a most unusual thing. Unlike another poet, he did not "celebrate himself," nor even talk about himself. In the conversation at the Craigie House there were many "flashes of silence" and periods of absent-mindedness, when the poet may have been upon the track of a new poem. To the misadventures of his enemies, the lion-hunters, there are some notable additions. On his return voyage from Europe in 1842 he was cabined and confined for fifteen days, twelve of them in his berth, and there he thought out by night his seven poems on slavery and wrote them down in the morning.

That "aloofness" which Margaret Fuller found in Emerson may account for the less personal tone of the second chapter, which is as characteristic of Emerson as the first is of Longfellow. "Emerson's Young Man," some new discovery of genius, was a constant joke among his friends. Once it was a youth in the far West who had sent him verses for his criticism. Apparently he has not been discovered. One of his lines which Emerson thought a great one was, as here given,

> "Life is a flame whose splendor hides its base."

Our own recollection of Emerson's quotation is "Life is a lamp," etc., with another,

> "The short parenthesis of life was sweet."

There is an amusing story of the elder Henry James's monopolizing one of Alcott's "conversations" until Emerson's Aunt Mary cried, "Let me confront the monster!"—suiting her action to the words. In spite of Emerson's distrust of laughter (wherein he was at Carlyle's antipodes), at Dickens's reading of 'Dr. Marigold' "he laughed as if he would crumble to pieces." He took his revenge later in the evening by declaring Dickens to be "too consummate an artist to have a thread of nature left." His indifference to "Faust" and his inability to read Dante Mrs. Fields attributes to his early reading of them in poor translations; but here, as elsewhere, her critical opinions are less valuable than her personal impressions. Emerson's reading of his "Voluntaries" to Mr. Fields at the Parker House in a disordered room which a former occupant had just vacated, is one of the choicest bits. Mr. Fields, it seems, suggested the title. The amount of coöperation in the Boston literary set is getting constantly fresh illustration.

Of all her literary friends in the first rank Holmes was the best known to Mrs. Fields, and no more creditable and engaging account of him has yet been written than her own. Although he was a near neighbor to the Fieldses, he wrote them many letters, and almost invariably when at the top of his condition. Some of his encounters with Hawthorne and Lowell are of special interest. Lowell praised his lyrics, but Holmes depreciated them as "too hopping." Evidently his "Chambered Nautilus" represented for him a mood to which he attained too seldom, when he was "rapt out of himself and carried away into the region of the divine" and taught what he should speak.

Mrs. Fields's acquaintance with Mrs. Stowe began with the civil war. We are shown how far a little went with her in the way of actual observation when she came to write 'Uncle Tom's Cabin.' Even more remarkable was her lack of apparent engagement with the subject of slavery before this. The circumstances under which she wrote her most famous book are well described in a passage taken from one of Mr. Fields's lectures. A habit which she had of suddenly retiring into herself in companies where she had been taking a leading part, must have been disappointing and embarrassing. She was always eager to try upon some friend, as soon as possible, what she had written. She was much interested in spiritualism, and her husband, who had a way of seeing visions, once mistook her for one, and treated her with distant courtesy until she began to laugh. Writing to George Eliot, she took for granted that Mr. Casaubon in 'Middlemarch' represented Mr. Lewes, and could with difficulty be cured of the idea. The irresponsible Will Ladislaw would have been a likelier guess.

The chapter on Celia Thaxter sounds the note of personal affection stronger than any of the others, and it is written the most continuously, with fewer letters to illustrate the character, because the sketch was made to introduce a volume of letters. Mrs. Thaxter's first published poem, "Land-Locked," is quoted in full as being "as beautiful as her latest work." If the critic had not been subordinate to the friend, would not Mrs. Fields have said that Mrs. Thaxter never wrote another poem quite so fine as that? All who knew her even a little will find it easy to believe the praises of her friend.

The Whittier chapter is valuable, not only for its delineation of Whittier, but for its glimpses of Mrs. Child and its tokens of the great esteem in which he held her graces and her gifts. The way in which she mingled her economies and charities was most admirable. When she gave Wendell Phillips $50 for the Kansas negroes, he thought it was too much and advised her to think it over. She did and sent another fifty later in the day. Whittier's interest in Robert Dale Owen is reported, but it was imperfect on the spiritualistic side. There is a true story current to the effect that when Owen, describing certain visions, asked Whittier what he should do if he should see such things, Whittier said, "I should scoot," and instantly made off. Rossetti's ballad, "Sister Helen," impressed Whittier the more because he had seen his aunt and mother burning the waxen image of a clergyman whose heresies they could not endure.

Tennyson was not inclined to personal talk. He preferred reading his own poems or those of other poets, and Mrs. Fields represents his reading, which was rather chanting, as remarkably impressive, especially when the matter was his own parting of Arthur and Guinevere. Mrs. Browning thought Tennyson's wife was not critical enough with him, but was she more critical with her own poet? It is evident from the exquisite sketch of Lady Tennyson that her share in her husband's occupation as a poet was unlimited, and that both their lives were singularly remote from common ways.

The Rise and Growth of the English Nation. With special reference to Epochs and Crises. A History of and for the People. By W. H. S. Aubrey, LL.D. 3 vols. D. Appleton & Co. 1896.

It is hard to see why this book should ever have been written. It is not exactly fatuous; it indicates a good deal of reading, on the whole wisely directed, as well as a certain hard common sense about matters of detail. But there is nothing new in it, either in the way of information or of philosophic generalization. It is perhaps half as long again as Green's 'Short History'; but no one whose opinion is worth having would advise a student or "the general reader" to spend his time over Mr. Aubrey's book rather than over Green. And when the student has read Green, he will be ready to turn to writers of larger calibre than Mr. Aubrey—to Macaulay and Gardiner and Lecky and Freeman and Stubbs.

The author tells us in his preface that the work is "written in no partisan or sectarian spirit." No doubt he has tried to be fair; but, as a matter of fact, the book is throughout that of a Radical of the generation just passing away, with all the limitations and self-satisfaction which only too frequently marked the race. He exemplifies, one cannot help saying, his own remark that "there is no prejudice so strong as that which arises from a fancied exemption from all prejudice" (iii., 27). A few examples will suffice. The account of the Anglo-Saxon Church bears the title "Rise of Ecclesiasticism"; and, before we get far into it, we are told that "a professional order of priests, whether Christian or pagan, Romanist or Protestant, is always a menace to a community" (i., 76). The Great Charter, the Petition of Right, and the Bill of Rights "did not confer fresh privileges"; they only "reaffirmed" "ancient and indisputable public rights" (i., 229). "For nearly five hundred years," in the Middle Ages, the "Protective Spirit was rampant in every department of Church and State" (i., 372). The ecclesiastical system of the Middle Ages is described as the priesthood's "tawdry paraphernalia of dogma and mystery" (i.,390), rearing "a mighty fabric of tyranny on a foundation of imposture" (i., 392). When our author gets to the periods of the Stuarts and of George III.—the happy hunting-ground of commonplace Radicalism—he warms to his task: "James I. knew as much as a troglodyte of the people over whom he nominally ruled" (ii., 317); and Mr. Aubrey is apparently surprised to find that he "never forgot or forgave Andrew Melville for telling him in a public audience that his kingship was subordinate to Christ's, as embodied in the Kirk" (ii., 319). Laud, among other things, "derided patriotism" (ii., 394), and "attempted to extirpate freedom of thought" (ii., 396). And, finally, "the long reign of George III." may be "expressed in concise terms" as "sixty years of blundering, injustice, and repression" (iii., 200).

That there is an element of truth in each of these propositions and in scores of like remarks to be found in this work, we are not concerned to deny. But it is a truth that has long been sufficiently dinned into British and American ears; it panders to that conceit of the modern and enlightened which does so easily beset us; and it is so one-sided that it again and again misses the true issue. Even an evidently one-sided treatment of a subject may, indeed, be rendered attractive by charm of style or distinction of manner. What readers will find in Mr. Aubrey may be judged from this specimen of his sententious moralizing: "In every age there have been too many with souls wholly given to dress and adornment, yet having no innate sense of beauty, grace, or fitness, who suffer themselves to become mere lay figures for exhibiting the freaks of fashion, regardless of health, comfort, appropriateness or decorum" (i., 162).

However, it is not absolutely a sin to write even 1,400 pages with contents such as these. It must have furnished a pleasant occupation to the author for several years; and, after all, nobody need buy the book. What does irritate one is the pretentiousness of the performance, the air of unusual intelligence and novelty. This is going to be a history "of and for the People," says the title-page. "It is important to exhibit the Commonwealth, as distinct from what is called the State; the People, as distinct from the titular Monarch; and the National Life, as distinct from the trivial circumstances of the hour" (i., 3). Do not come to me, says Mr. Aubrey, for "records of royal imbecility, of palace scandals, of political huckstering, of factious strife, of official corruption, of battles and sieges, and of all the accidents and excrescences of former times." "They will be found," he observes with fine scorn, "in works specially devoted to Court millinery and upholstery" (i., 2).

Such a work as we are here promised would necessarily involve intense and prolonged application; and so Mr. Aubrey informs us. "Designed for popular reading, its pages are not burdened with footnotes giving the authorities." But "the utmost care has been taken . . . to use all available information," and "ordinary readers have no conception of the prolonged and toilsome labor of examining authorities" (i., 10). What he means by "examining authorities" we may gather from his remark apropos of the "three hundred and fifty volumes of the Rolls Series": "Life is not long enough to search among so many bushels of chaff for a few valuable grains of wheat. The bulk and multi-

tude of the Calendars" (an odd term) "would render them almost useless, but for their complete indices and introductory historical matter" (i., 9). The truth is, Mr. Aubrey's learning is chiefly second-hand; and his mental attitude is like that of scores of his predecessors. A history of the People he does not give us: he gives us only a crowd of disconnected facts and observations, put together in chapters by themselves at the end of each section of political history, in the good old semi-enlightened fashion. Take two sufficient instances. England in the Middle Ages was an agricultural country; from the point of view of social evolution, therefore, the one all-important subject of mediæval history is the condition of the peasants. Mr. Aubrey returns to it again and again for a few sentences, but the most intelligent reader might be defied to construct out of them a clear picture of the situation—for the simple reason that Mr. Aubrey has no clear understanding of it himself. He may have turned over the pages, he cannot have given any sustained thought even to the books he parades in his Bibliographical List. Vinogradoff would have saved him from repeating the old fiction about *villeins regardant* and *in gross* (i., 168)—a small matter, but significant.

England, again, is "the classic land" of "the great industry." "The Industrial Revolution" has profoundly affected the lives of tens of millions of Englishmen. Will it be believed that to the inventions in the textile industries and their effects Mr. Aubrey devotes in all some forty-four lines (iii., 246, 292), about as many as are given to George III.'s lunacy (iii., 243); fewer and far less impressive than those on "the progress of invention" in Mr. S. R. Gardiner's book, which professes only to supply the wants of schoolboys ('Student's History,' 814-818)? The point need not be labored. In dealing with political history Mr. Aubrey does avoid unnecessary detail; names and dates are mercifully few. But he has not really risen above the political point of view, and his work is essentially conventional.

The Cell in Development and Inheritance. By Edmund B. Wilson. Macmillan. 8vo, pp. xvi, 371. 1896.

THIS volume is one of the very best scientific manuals published in America, and is sure of a rapid recognition and generous welcome, not in this country alone, but in Europe also. Its importance depends first upon the subject, and second upon the author's presentation. The subject is of course as old as the cell-theory itself, but the observations upon which our present views are based have been made almost wholly within the last twenty years, and most of them within the last ten years. These observations have brought a whole series of new conceptions before the scientific world—conceptions which bear upon the fundamental questions of biology, and are equally significant to zoölogists, botanists, and philosophers. We are confronted with new theories of generation, of sexuality, of heredity, of growth, and of the chemistry of living matter, and all created out of a wealth of new discoveries unparalleled in any other domain of biology. As a rule, zoölogists and botanists pursue their independent ways; but in the domain of cell phenomena they have worked during the last dozen years in true collaboration, earning thus great rewards.

Treatises on the cell as the unit of vital phenomena have been recently published in German by Oskar Hertwig, and in French by Henneguy, both authorities of the highest rank, who have won reputation by these works. These have a strong impress of their respective authors. That which marks Wilson's book is precisely the absence of the personal element. He gives, not special arguments in favor of his own views, or fuller presentations of his own researches, which have been important, but a well-proportioned and balanced summary, in which his own work is measured fairly with that of others. This mental impartiality has bestowed a special value upon the author's digest of the hundreds of investigations he has epitomized, and is displayed again in the very large number of exact citations which he gives. For these citations he has adopted the system of Mark and Minot, which is simple, concise, and precise, and mars the text very slightly. The list of authorities is imposing, for it covers thirteen closely printed pages, although it includes only the titles of works actually referred to in the text. A noteworthy characteristic of the book is its thoroughness. Prof. Wilson shows an extensive personal familiarity not only with the phenomena which he discusses, but also with the observations and opinions of numerous other investigators.

As regards the forms of presentation and the style, the author excels. His treatise is of course not addressed to the general reader, but to persons having at least some knowledge of cells. To such readers the chapters will be clear, interesting, and instructive. The new technical terms, which are unfortunately rather numerous, are explained as they first occur, and are also gathered in a glossary at the end of the volume. The definitions in the glossary are almost uniformly admirable.

The subject-matter is divided into an introduction and nine chapters, as follows: i., General Sketch of the Cell; ii., Cell-Division; iii., Germ Cells; iv., Fertilization of the Ovum; v., Reduction of the Chromosomes, Oögenesis, and Spermatogenesis; vi., Some Problems of Cell-Organization; vii., Some Aspects of Cell-Chemistry and Cell-Physiology; viii., Cell Division and Development; ix., Theories of Inheritance and Development. Each of these topics is well analyzed, and the often conflicting views are adequately given. It is here that Prof. Wilson's good temper and sound judgment reveal themselves advantageously. In such a book it is important to express the author's estimate of the value of diverging opinions, to assist the reader to decide which view is at the time most plausible, or, when this is impossible, at least clearly to state that the evidence is insufficient. It will be found that Prof. Wilson has met these demands with conspicuous conscientiousness and yet temperately.

The defects which we have found relate to minor points. Thus, Weismann is erroneously quoted as one of the founders of the view that the nucleus is the organ of heredity (p. 5); Purkinje and Oken should be cited in connection with the history of the cell doctrine; the quantitative relations of the protoplasm to the nucleus should be noticed. It is, however, better to leave such petty criticisms, for it is a truer service to the reader to emphasize the very great merits of a work which does the highest credit to American science. The mechanical appearance of the volume is good. The typography is clear and the illustrations, which are numerous, are well printed and they have been well chosen. A large proportion are original. A double index (of authors cited and of subjects), prepared with much care, facilitates looking up any special point. The volume is the fourth of the Columbia University Biological Series, and will certainly go far towards sustaining and increasing the reputation of Columbia as one of the three or four best University centres for biological research in America. In conclusion, we may say that students and investigators of biology, in whatever department they may be working, ought to be familiar with this important work.

John Wellborn Root: A Study of his Life and Work. By Harriet Monroe. Boston: Houghton, Mifflin & Co. 1896.

THIS square octavo volume of 290 pages is devoted to the life of an architect of most interesting personality, who had much to do with the furnishing of the great West with considerable buildings. There is no doubt of the originality of conception and vigor of design which Root showed in his work. He was one of the few who designed as a trained instinct bids them in view of the requirements of a structure, and the plan which those requirements have brought into being. Yet it can hardly be said that anything portrayed in these pages is likely to be considered a monument of architecture such as the world will desire to preserve.

The chapter which deals with Root's ideas of modern architecture contains many of the architect's own sayings, extracts from papers, and the like, which are full of sound sense. In one of these extracts he says plainly that whenever in the world there has been "a period or style of architecture worth preserving, its inner spirit was so closely fitted to the age wherein it flourished that the style could not be fully preserved, either by people who immediately succeeded it, or by us after many years." This cogent sentence he elucidates by very intelligible and very persuasive examples. Had it been possible for a large sense of propriety to embody itself at once in architectural results, Root would have been the man to bring about such a change in our architecture as the times required. Indeed, he was in a very large sense that which the West needed most, namely, the man who would persuade intending builders to give up galvanized iron cornices and jig-saw ornament, as the author of this book says, and to demand of them sounder and more serious methods of building.

The succeeding chapter is devoted to Root's work and its results, and in these two chapters lies the value of the book for other readers than those who were his friends and associates. The rest of the volume is an interesting biography of a man who lived a simple and straightforward life of work and thought, but it is of no special value as illustrating the surroundings of the man, either in his boyhood in the South or in his manhood spent in the West. The appendix, written by Mr. Henry Van Brunt, serves at once as a friendly and cordial criticism of the book and an obituary notice of its subject. Mr. Van Brunt refers to a list, which he has by him, of the work done by the firm of Burnham & Root, and sums it up. This final statement is of a certainly surprising number of important buildings: "forty-four structures of a public character, such as office-buildings, hotels, churches, apartment-buildings, schools, railway stations, etc., in Chicago; twenty-five of the same classes elsewhere; eight buildings to cost from $400,000 to $1,000,000 each, in course of erection, and one hundred and twenty residences of the first class." Assuredly this is a

remarkable record for eighteen years, and it is probably true, as Mr. Van Brunt asserts, that "there are fewer indications in this series of the forcing of structure into archæological or academic moulds than can be found in any modern European examples of corresponding buildings" The question which remains unanswered, and which the future only can answer, is how far this serious effort will be crowned with the success which it merits.

NEW BOOKS

Robert the Bruce

And the Struggle for Scottish Independence. By Sir HERBERT MAXWELL. New volume (No. 19) in *Heroes of the Nations Series.* Fully illustrated. Large 12mo, $1.50; half leather, gilt top, $1.75.

The "Heroes of the Nations" is a series of biographical studies of the lives and work of certain representative historical characters, about whom have gathered the great traditions of the nations to which they belonged, and who have been accepted, in many instances, as types of the several national ideals. Edited under the editorial supervision of Evelyn Abbott, M.A., of Balliol College.

The God-Idea of the Ancients;

Or, Sex in Religion. By ELIZA BURT GAMBLE, author of "The Evolution of Woman." 8vo.

Mrs. Gamble's purpose has been not only to furnish a brief outline of religious growth, but to show the effect which each of the two forces, female and male, has had upon the development of our present God-idea. Her investigation of the subject has served to accentuate the conclusions arrived at in her earlier book relative to the inheritance of each of the two lines of the sexual demarcation.

Hypnotism,

And its Application to Practical Medicine. By OTTO GEORG WETTERSTRAND, Member of the Society for Swedish Physicians at Stockholm, Corresponding Member of the Society for Psychical Research, London, etc. Authorized Translation from the German edition, together with Medical Letters on Hypno-Suggestion, etc. By HENRIK G. PETERSEN, M.D., Member of the Société d'Hypnologie et de Psychologie, Paris, etc. 8vo, $2 00.

Braithwaite's Retrospect.

A half-yearly journal of Practical Medicine and Surgery, containing a retrospective view of every discovery and practical improvement in the medical science, abstracted from the leading medical journals of Europe and America. Edited by JAMES BRAITHWAITE, M.D., Surgeon to the Leeds Hospital for Women and Children. 12mo, subscription per year, $2 50; per single part, $1 50.

The Nation.

NEW YORK, THURSDAY, MARCH 11, 1897.

The Week.

UNRESERVED praise must be given to President McKinley's hearty support, in his inaugural address, of the arbitration treaty now pending in the Senate, and his earnest recommendation that it be speedily ratified. In this particular the new President has even surpassed the expectations of the friends of the treaty. It would have been very easy to indulge in commonplaces on this subject, but Mr. McKinley goes much beyond the ordinary language of commendation of the treaty. He holds it up as an example for all nations. "The importance and moral influence of the ratification of such a treaty," he says, "can hardly be overestimated in the cause of advancing civilization. It may well engage the best thought of the statesmen and people of every country, and I cannot but consider it fortunate that it was reserved to the United States to have the leadership in so grand a work." Equally encouraging are the President's utterances on foreign affairs in general. He declares himself for peace in principle, says we want no wars of conquest or foreign aggression, or war for any purpose until every agency of peace has failed. These earnest and emphatic words must have a most beneficial effect upon trade and industry, and it is to be hoped that they may quiet for a time the black-horse cavalry of the Senate. On the subject of civil-service reform Mr. McKinley stands by his avowed principles. He recalls the fact that, as a member of Congress, he spoke and voted for the present law, and says that he means to enforce it in the spirit in which it was enacted. There is every reason to believe that these words are uttered with a sincere purpose, and that they will be followed by corresponding acts.

One paragraph of the address will, we suspect, set Mr. Sherman thinking. "The several forms of our paper money," the new President declares, "offer, in my judgment, a constant embarrassment to the Government and [to] a safe balance in the Treasury. Therefore I believe it necessary to devise a system which . . . will present a remedy for those arrangements which, temporary in their nature, might well in the years of our prosperity have been displaced by wiser provisions." Considering whose fault it was that the "temporary arrangements" for the currency were not in prosperous years "displaced by wiser provisions," we imagine that Mr. Sherman may in the future be somewhat less positive about the virtues of the greenback. This side-thrust from his present executive chief recalls a similar snub received some years ago on the same question—at the very time, in fact, when the "wiser provisions" hinted at by Mr. McKinley might readily have been adopted. In his annual Treasury report of December 6, 1880, at the top wave of the trade revival, Secretary Sherman wrote: "United States notes are now, in form, security, and convenience, the best circulating medium known." In fact, he deprecated any further suggestion that they were a menace to the future. But on the very same day President Hayes, in his annual message to Congress, commented thus on his Secretary's optimism: "The retirement from circulation of United States notes is a step to be taken, in our progress towards a safe and stable currency, which should be accepted as the policy and duty of the Government and the interest and security of the people." The course of events since 1880 has sufficiently proved the wisdom of this position of a conservative Republican President; it has equally proved the futility of Mr. Sherman's theories.

The *Sun* made a very able summary of the President's inaugural, leaving out all the principal points. It omitted his declaration of adherence to the gold standard, his favoring a commission to revise the currency, and his intimation that the greenbacks should be retired. This, of course, was a little too strong doctrine to be given undiluted to *Sun* readers, who have been assured all along that nothing whatever was the matter with the currency, and that no patriot would ever talk of retiring the greenbacks. We observe that the greenback *Tribune* was also silent on this point—as, indeed, it has been ever since Mr. Gage was chosen for the Treasury. Of course the *Sun* cannot muster courage so much as to allude to Mr. McKinley's horrible views on civil-service reform; and as for his love of peace and hearty and unqualified endorsement of the arbitration treaty, the pain which they give the Jingo organ is of the kind which the hymn calls "inward." The only outward sign of anguish as yet betrayed is the remark that there are "some important omissions" in the inaugural, "some points of vagueness, and some signs of what we believe to be mistaken judgment." The howling of the Jingo robbed of its whelps will be heard later.

The Fifty-fourth Congress, which expired on Thursday, leaves, on the whole, a negative impression. No great act, either beneficial or mischievous, will be associated with it. Judged solely on the basis of the evil it might have done and refrained from doing, the verdict would not be so severely unfavorable. It did not, for example, pass the Nicaragua Canal bill or the Hawaiian cable subsidy. But a negative Congress, when the times call for a positive and constructive Congress, is of itself harmful to the public. Take the absolute and humiliating failure of this Congress to grapple with the deplorable condition of the currency and the national revenue. Take its deliberate action in voting appropriations which compel a deficit of $100,000,000. There alone is a confession of legislative imbecility and recklessness. There alone is a crushing condemnation of a body chosen to subserve the public welfare. When we add the wanton willingness of both houses in the first session, and of the Senate in both sessions, to embroil the burdened country in a needless foreign war, we get a record which, though negative as far as achievement is concerned, is positively evil in its demonstration of incapacity and irresponsibility. The worst of it is the general sense of discouragement which the Congress leaves behind it, and of concern, even alarm, over what its successor may do. The Fifty-fourth Congress was ushered in with much acclaim. At last we were to make an end of Democratic bickering and incompetency. The results are now before the country, and we observe a disposition to accept with great reserve the promises again so lavishly made in advance for the Fifty-fifth Congress.

Senatorial courtesy was severely strained during the trying final hours of the session, and remarks were made which seemed to show that the Senators have as low opinions of one another as the general public entertains of the body as a whole. A few days ago Senator Tillman declared that while he did not wish "to say anything harsh," God knew that he believed he was telling the truth when he said that the "Trusts have their hands in our [the Senators'] breeches-pockets." Senator Hawley "branded" this charge as "an unworthy slander, unworthy of any gentleman." During the last night session, Senator Hoar observed that the rules never intended to "put it in the power of one man, who in some conceivable case might be under the influence of liquor, to prevent eighty-nine men from doing business"; whereupon Senator Quay declared that if the Senator from Massachusetts intended to intimate that he (Quay) was under the influence of liquor, he was a "lunatic and a liar," and he would further characterize the intimation as a "filthy one." If Mr. Quay wishes to have it understood that this is his usual debating style when sober, there should be no objection.

Vice-President Stevenson's farewell address shows that the Senate made no mistake when it presented him the other day with a silver service. He deserved even that certificate of character, for he in turn certifies to the greatness, the wisdom, the beneficence of the Senate, which he thinks ought to be enshrined in the loving memory of a grateful people. Almost tearfully he says: "Of those who clamor against the Senate and its methods of procedure, it may truly be said, 'They know not what they do.' In this chamber alone are preserved without restraint two essentials of wise legislation and of good government—the right of amendment and debate." This, we are glad to see, is not the view of Mr. Stevenson's successor. In the midst of the usual perfunctory remarks of an incoming Vice-President, Mr. Hobart has one telling passage in which he plainly intimates that a change of the rules and of the conduct of the Senate is imperatively demanded, and that without it the "just expectations" of the people will not be met. If Mr. Hobart keeps this great truth steadily before the Senate and the country, he may escape both the "silver service" and the general contempt with which Mr. Stevenson leaves office.

Mr. Olney kept the Cuban business in his own hands (where it belonged) to the end, in defiance of the Senate. He leaves the cabinet with a reputation won in it such as is without a parallel since the war—unless Gen. Bristow furnish the parallel. The cabinet has been mainly a place to wreck great reputations rather than to create one. Secretary Olney's direct energy and steady striking at the point have sometimes played him tricks—once, in the Venezuela business, a most flagrant one—but on the whole have been most successfully applied. Especially in one particular has he struck out an original line, in a useful fashion. He has shown how a cabinet officer may defend himself against an intriguing Congress. Without a voice on the floor of Congress, Mr. Olney has shown that he could still get the ear of the people. Twice at least he has simply transfixed the Senate and left it writhing in helpless rage. Once was when he informed the country and the world that the stock-jobbing resolution of Don Cameron, recognizing Cuban belligerency, would be ignored by the Executive even if it was adopted by both houses of Congress. That let out what little brains there was in that business. Again, on Monday week, by simply giving to the press what he had before given to the Senate in confidence, he showed how needless, how wicked, was the agitation of the country and the depression of the stock markets by the Sanguilly clamor. He has thus twice made the Senate furious, but he has made it dumb—in itself a great public blessing. It is to be hoped that Mr. Olney has, in this particular, given the cabinet a hint of the way to do it, which its members in the future will not hesitate to follow when the occasion calls for it.

The Chamber of Commerce last month suggested informally to Mr. Cleveland that it would be glad, if agreeable to him, to give him a public dinner in recognition of his "valuable financial services." To this he replied, in a characteristic letter, that the suggestion afforded him "as complete satisfaction and comfort as any other demonstration of it could do," besides which he could not feel that what he had done or attempted to do for the general welfare deserved any "special manifestations of approval," since it was all within the scope of his duty. The refusal of a "banquet" by a public man on the ground that he has merely done his duty is a novel idea. What a trick the fat-witted Mugwump idol has of doing modest, manly things!

Hart, the Philadelphia filibuster, has been sentenced to two years' imprisonment and $500 fine. His offence was being concerned in the filibustering expedition of the steamer *Laurada* in August last, and of this he was convicted on February 23; Judge Butler, who sentenced him, considered the proof against him clear. Hart sent the *Laurada*, and controlled her movements; he gave an order to send surf-boats from Camden to her below Wilmington; he concealed his identity; he directed the movements of the Cubans concerned, and met them at Atlantic City; the only debatable question was whether he had previous knowledge of the military character of the expedition, and this the jury found against him. The Judge said in imposing sentence that he had had a full and fair trial; that the offence was a grave one, involving the honor and peace of the country; that he went into it with his eyes wide open to the consequences, and for the "unworthy purpose of personal gain"; that it was the duty of the court to punish him severely. This case, and that of the *Three Friends* in the Supreme Court, show that the time has come when the use of the territory of the United States to fit out ships and hire men to go off and murder and rob in foreign countries with which the United States is at peace, must be systematically rooted out. There is no trouble with the courts, and the substantial people of the country now support warmly every enforcement of the law.

The various States keep forty-five Legislatures at work pouring out laws of one kind and another. Does any one realize that they give us every year or two something like 10,000, or that they will in fifty years produce 500,000 laws? In this State alone last year there were a thousand. Most of them, of course, are not laws, in any proper sense of the word, but represent either jobs or interference with the business of corporations, cities, towns, and villages—business which the Legislature usually botches. Paving streets and building bridges and putting up big buildings, for instance, are some of the favorite forms of legislative activity everywhere, yet if sensible men were asked who should decide about building their bridges or paving their streets or erecting their city halls, the very last body in the State that they would call in would be the Legislature. A great deal of their work is of such a nature that it is difficult to tell whether it is not the result of insanity on the part of some one or more of its promoters. A bill has been introduced in the Kansas House, and it is said will probably pass, making violations of the Ten Commandments criminal offences, punishing "having any other God" with a fine of $1,000, and making theft, perjury, and covetousness punishable with fine or imprisonment, at the discretion of the court. This is attributed to "Populism," but think what a rabble must have got into a state-house when such a bill can be introduced and seriously discussed. On the same day the Kansas Senate was thrown into great excitement by two members who said that they had been offered $1,000 for their votes, and there was much feeling on the subject. Bribery is the only natural means of getting laws passed in such a body, and "the path will be trod."

Kansas City some years ago passed an ordinance compelling every one to vote, under a penalty of $2.50. The courts have declared the measure unconstitutional, and have been overruled by the *Harvard Law Review*, which says that the matter was disposed of by Mr. C. E. Shattuck in an article contributed by him to its pages (4 Harv. L R 365). The question whether it is unconstitutional or not is perhaps of less importance than the question whether it is foolish. The reason why the franchise has always been considered a privilege is because people have wanted to vote; and as long as they do want to vote there is no need of making it a penal offence to stay at home. On the other hand, there is in every election, even Presidential elections, a considerable proportion of voters who are compelled by illness, by business, or other causes which concern themselves primarily, to stay at home, or to be absent from home, in other States, or abroad. In a large city like New York there are many thousand such cases; in the whole country in a Presidential election there may be many hundred thousand. In other elections, too, there are sometimes many thousand voters who do not vote because one candidate does not represent their ideas, and the other candidate is unfit for office. In some cases neither candidate is fit for office.

Any law which should undertake to treat all these abstainers as criminals would certainly be very difficult of enforcement, and very barbarous in operation, if the penalty were severe. Hence, perhaps, the low Missouri figure of $2.50. We know a good many people, even in this meek and long-suffering community, who would "clear out" altogether if visited with any substantial punishment because they preferred to stay at home rather than vote for Sheehan on one side or a creature of Platt's on the other. If good nominations are made, there is no trouble about getting out the vote; and if nominations are bad, staying at home is often a useful protest. Whenever voting ceases to be of interest to the bulk of the community, it will be from despair of effecting anything, and driving us up to the polls to exercise a right we don't care to exercise would be a waste of time. On the other hand, let us implore legislators taking the matter up to remember that in many parts of the country $2.50 is still a small sum of money. In some States the danger of losing this sum might bring every man to the polls; but it is not so in all States. If the continuance of free institutions is to rest on compulsion, we should insist on a higher figure. It would give but a poor idea of us abroad if we came to be looked upon as a body of freemen caring so little for liberty and so much for money that we could be kept free only by the danger of losing $2.50.

The insidious nature of political corruption is well shown in the case of the member of the Montana Legislature who has just been expelled. He testified before the investigating committee that at different times in the session he had "found" in his room sums of money ranging as high as $200, and that he had been in the habit of using parts of such sums for or against certain pending bills. He saw nothing wrong in this. There may be nothing wrong, but there certainly is something strange, almost supernatural. Was it a mere chance coincidence, as seems to be suggested, that he should "find" the money just when it was needed? And how could he tell exactly what bills to use it for or against? If his account of the matter is the true one—and we read that he testified to the truth of it "in the most nonchalant manner possible"—we see corruption working with a silent and irresistible power like that of fate. To expel a man for not resisting this seems as unreasonable as to expel him for not resisting gravitation. But perhaps he was expelled for confessing that he used only "parts" of the money to bribe his investigators.

Some surprise is expressed by the legislators at Albany because so few of our citizens take the trouble to go up there to oppose the passage of the proposed new charter, but he must be a very dull legislator who does not know why this is the case. Why should anybody take the trouble to go to Albany on a perfectly useless errand? Why should time and energy be expended in making serious arguments before committees who will not pay the slightest heed to them, but will act in blind obedience to "orders" from an express office in lower Broadway? Everybody at all familiar with our present system of government in this State knows that the fate of the charter hangs entirely upon the will of Mr. Platt; that if he wishes it to become a law and go into effect at the next election, the Legislature will carry out his wishes. Argument or reason has nothing whatever to do with the question. If Mr. Platt thinks it will be "good politics" to pass the charter, it will be passed, otherwise not. He assumes full power over the subject in his public utterances, and declares that it is his wish that the charter shall pass. If that is his real intention, it is a waste of time for anybody to go to Albany to plead with his agents in the Legislature. The only effective use of influence is with him, so far as legislative action is concerned. This is undoubtedly the view of opponents of the charter, of whom there is no lack in this city. They have hopes, which are not without good foundation, that the political unwisdom of passing the charter this year will induce Platt to give "orders" for its defeat or postponement. The signs of the times are all in one direction, and point to a political reaction in the State this fall.

The action taken by the Century Club at its meeting on Saturday evening, excluding from its files and its club-house the *World* and the *Journal*, is another step towards the extirpation of a social pest. The movement has now become a popular one, and may be expected to extend far and wide. It ought to find imitators throughout the nation. There are other filthy publications in other cities that ought to be put under the ban equally with the two which have been excluded by the Century Club. It is possible for the decent people in the several communities to reform these journals and save their children from the moral blight which threatens them, by putting such a stigma upon them that the mass of unthinking people who now support them will drop them, and, when they do so, the reform will come. It is simply a question of dollars and cents with the publishers of these vile sheets. Whenever they find that dirt does not pay, they will stop publishing dirt. Clubs and public libraries can hasten this consummation if they will by making dirty newspapers unfashionable.

Japan's coming abandonment of the silver standard is an *et-tu-Brute* blow to our silverites of the free and independent kind and of the slavishly international sort. Japan, alluded to in a large way as "the Orient," has long been a tower of strength to them. Free silver coinage might have its risks, but how about the Oriental trade? We might ourselves manage to worry along on the gold standard, but could you hope that the Japanese ever would try it? Besides, there was that terrible par of exchange which we must contrive to keep from being dislocated, and doing something for silver was the only way to accomplish this. But this "Asian mystery" of bimetallism is now fast crumbling to dust. First India shut her mints to silver; then Russia, already a great Asiatic power, and destined to be greater, took herself out of the ruck of silver-using nations; now Japan leaves the sinking ship. Yet our humbug Congress chooses this moment to pass without dissent an insincere bill for an international silver conference.

The constitutional change which President Krüger is trying to introduce in the Transvaal is very like a proposition in this country to take away from the Supreme Court the right of passing on the constitutionality of laws enacted by Congress. In the Transvaal the High Court has been in the habit of setting aside laws of the Volksraad not in accordance with the fundamental law of the republic. Krüger wants this stopped, and has now had the Volksraad adopt a declaration that the judges of the High Court shall take an oath renouncing the right to apply a constitutional test to any laws passed. He says that this is necessary in order to overcome the machinations of Cecil Rhodes, and that the Judges must "abide by the voice of the Raad or go." This is good Populist doctrine, and the uproar in the Transvaal over its attempted application hints at the sort of thing it would lead to here.

Greece has replied to the ultimatum of the Powers, if there was an ultimatum, which Mr. Balfour denies. Her reply is a practical refusal, though couched in language of studied courtesy, to withdraw her troops from Crete, and a pretty effective argument against the plan of the Powers to set up an autonomy in Crete under Turkish suzerainty. The reply is adroit, and will doubtless lead to further negotiations before force is resorted to by the Powers. Indeed, the French Minister of Foreign Affairs distinctly stated on Monday that France would undertake no operations against Greece without the consent of the Chamber. The thoroughly artificial character of the present situation is well shown in the fact that upon Italy's admiral in Cretan waters devolves the initiative in proceedings agreed upon by the allied fleet, while the peninsula is, as our correspondent shows on another page, in a fever of popular sympathy with the insurgents.

THE NEW CONGRESS AND ITS TASK.

THE extra session will evidently not be the swift and simple thing that some swift and simple people have imagined. It is already complicated by the failure of four great appropriation bills. One of these, the General Deficiency bill, failed because the strife of the jobbers was so rancorous that they could not agree in time to pass it at all. The others—the Indian Appropriation bill, the Agricultural and the Sundry Civil bills—failed because they were so stuffed with jobs and stealings that Mr. Cleveland would not put his name to them. These bills must all be passed before June 30 in order that the Government service may be carried on. They will therefore have to be considered before the new tariff bill. But it is said that they will speedily be repassed just as they were, and this will take no time to speak of. This, however, is to overlook the nature of a bill like the Sundry Civil. Before it can be reported and passed, two-thirds of the members of the House have to have something "good" in it. It was so with the bill which Mr. Cleveland refused to sign. It was incubated for many months until the necessary two-thirds was secured to suspend the rules and pass the bill—appropriating the bagatelle of $50,000,000—without debate, which was done. But now the work will have to be undertaken afresh. The membership of the House is greatly changed, and the new two-thirds will have to be secured by new balancing of job against job. This will take time. And who knows but President McKinley may veto it when done, on the ground taken in his inaugural address that this is a time for the severest economy? In any case, we think those who are flattering themselves with the thought of a sixty-day or a ninety-day session are reckoning without their host.

As the time draws near for the new tariff bill to be completed and presented to Congress, the difficulties of its framers do not lessen. The case of cotton-ties is typical. American manufacturers are now supplying them at 20 per cent. less than the English price, duty-free. What is the use, then, of a duty on cotton-ties either for revenue or for protection? The only defence for such a duty, as, indeed, for duties all along the list of the iron and steel schedules, is that Americans should be given a chance to combine and put up prices under cover of protection. But, in that case, where will the needed revenue come in? Take the item of wool. During the past month more than 38,000,000 pounds of wool were sold in this country, as against 23,000,000 for the previous largest record for the corresponding period—in 1893. This is only one of many signs that the woollen mills are stocking up with free wool for a year or so in advance. It is, of course, only human nature and hard business sense that they should. This being the case, how is the restored duty on wool either to bring in revenue or to give the farmers higher prices for the first twelve months? It can do neither, to any appreciable degree; and the chief result of the new wool duties will be what the result of the McKinley duties in 1890 was, to throw the woollen manufacture into confusion and to enrage the embattled Ohio wool-growers afresh.

A telegram to the *Herald* says that the tariff committee at Washington intends to adopt measures, the nature of which is not indicated, to prevent persons from importing foreign goods in anticipation of increased duties. Whether the importers are to be sent to jail or whether their goods are to be confiscated after they arrive, is not known. That something hitherto undreamed of is in contemplation, is clearly intimated. This, and other semi-barbarous devices that have been talked of, point to the belief that the high-tariff fanatics think that, as they have silenced the Bryanites, they can do anything they please without criticism or opposition, and that they can do the McKinley Act of 1890 over again, or more, without meeting the unpleasant consequences that followed that Act. If any such opinion prevails, it is a very mistaken one. The elements that hurled the Republicans from power in 1892 are all in readiness to repeat that discipline. The strength of all the forces that united to elect Mr. McKinley will be needed to support his Administration. To pass any tariff bill through the Senate will require very prudent management. To hold a majority of the House to be elected in 1898 will require cool and conservative treatment of all the leading subjects of legislation. Anything like confiscation of private property, or cruel and unusual punishment of persons engaged in foreign trade, will wreck all the high hopes centred on the last campaign.

One of the dangerous schemes in contemplation is the enactment of discriminating duties in favor of American ships, providing that goods carried in foreign bottoms shall pay higher rates—an old relic of barbarism abandoned in our legislation some sixty years ago. This particular scheme is identified with the name of Sewall, who ran as the colleague of Bryan in the last campaign. Sewall was the President of the American Marine Association, which was formed for the purpose of reviving this old, exploded policy. He was nominated at Chicago evidently in the interest of that project, but without any suspicion of the real motives except in a very limited circle. Mr. Sewall was an unknown man. His nomination was a surprise to everybody. The explanation of Sewall came when his connection with the scheme for discriminating duties was revealed. The trouble produced in his own party then became so serious that he felt obliged to resign the presidency of the American Marine Association. Now it is proposed that the Republican party shall help him out by enacting these discriminating duties, the first consequence of which would be a series of similar retaliatory enactments against our ships by foreign countries, all resulting in added burdens on the taxpayers without benefit to the public treasury.

The restoration of the reciprocity features of the McKinley tariff is also going to be a bothersome matter. Senator Burrows has sorrowfully announced that it will not be possible to restore reciprocity. But this was before President McKinley had declared in his inaugural that it must be restored. Still, the question remains, how is it to be done? Free sugar was the corner-stone of reciprocity in 1890. No one supposes that sugar will be free in the new bill. Something might be done with Argentina and Australia if wool were left free, but it cannot be. Will the tax on hides be revived, to comfort the New England Republicans? Truly the way of the reciprocal tariff-maker is a hard one this year. About all that is left him is to fall in with the suggestion of Congressman Dolliver, and give the President power to levy duties at his own sweet will on the imports of all countries that do not treat our exports "right." Treaties and laws and common sense are against this, but reciprocity must be had, no matter how high it comes.

THE "THREE FRIENDS" CASE.

THE laws of this country provide (U. S. R. S., sec. 5283) that every person who, within the limits of the United States, "fits out and arms, or attempts to fit out and arm, or procures to be fitted out and armed, or knowingly is concerned in the furnishing, fitting out, or arming of any vessel," with the intent that she shall be employed in the service of "any foreign prince or state, or of any colony, district, or people, to cruise or commit hostilities against the subjects, citizens, or property of any foreign prince or state, or of any colony, district, or people with whom the United States are at peace," etc., shall be fined not more than $10,000 and imprisoned not more than three years. It is further provided that the vessel shall be forfeited, one-half to the use of the informer and one-half to that of the United States.

The *Three Friends* was libelled in the United States Court for the Southern District of Florida, as a Cuban filibuster, on the ground that she was fitted out and armed to be employed in the service of "a certain people," viz.: "certain people then engaged in armed resistance to the Government of the King of Spain in the island of Cuba, to cruise and commit hostilities against the subjects, citizens, and property of the King of Spain, with whom the United States are and were at that date at peace." Judge Locke, who tried the case, decided that this would not do, because there was no allegation that the vessel had been fitted out to be

employed in the service of any colony, district, or people recognized as such by the political power of the United States. The Supreme Court have now reversed this decision, and remanded the cause to the District Court, with instructions to resume custody of the vessel.

Had any other conclusion been reached the law, which has been in existence since 1818, would have been nullified, and the Cuban insurgents might have equipped *Alabamas* by the dozen in Florida, with the curious result that those fitting them out would in Florida have been engaged in a lawful enterprise, while the vessels, once at sea, would have been pirates. The decision of the Supreme Court has put a stop to this, and explodes the fallacy on which Judge Locke's decision rested. It all comes from a confusion between our obligations as a neutral between two belligerents and our obligation to prevent the use of our territory for acts of war against states with which we are at peace. Our duty to observe neutrality between Spain and Cuba could arise only out of a state of war between them, and this state of war is a fact the existence of which it belongs to the political department of the Government to determine. It cannot well be investigated by the courts, we may add, because they have no machinery for carrying on investigations into the political condition of foreign states, and no means to take proof upon such a question unless it is brought before them incidentally in an ordinary lawsuit, in which case a final decision that belligerency existed might not be reached till the war was over and done with. For these reasons, the fact of belligerency is determined by the other departments of government (and usually the Executive) which have the means of inquiry. Now no state of belligerency has yet been found to exist in Cuba; consequently there is no neutrality on our part, and the only state which we can possibly know in the matter is Spain.

But the fact that we know of no public war between Spain and Cuba does not absolve us from preventing our territory from being used by filibusters to attack Spanish authority in Cuba, and does not prevent a court from taking cognizance of the fact that a filibuster may be fitted out for use by the Cubans against Spain. In such a case the act is an act of private war, which it is our business to put down, like any other deliberate criminal attempt to disturb the peace. In other words, the recognition of belligerency and the obligations of neutrality in the ordinary sense have nothing to do with such cases. The courts are, however, judicially informed, through various executive proclamations, of an actual revolt against Spain in Cuba, and hence must take cognizance of any attempt like that of the *Three Friends* to violate the statute.

This case, and others decided by the Supreme Court, make the whole law on the subject of the relations between the United States and Cuba perfectly plain, and there is nothing abstruse or technical about it either, for it simply grows out of the facts, and applies convenient and indispensable rules the nature of which they determine. There are three different sets of rules, corresponding to three different sets of facts.

(1.) There is the case of a colony like Cuba throwing off the Spanish authority, driving the Spaniards out of the country, and establishing an army and navy and courts of justice, collecting taxes, and making herself in fact an independent state. Independence in fact would be recognized by us as a matter of law, we should send a minister to Cuba, receive one from Cuba, hold Cuba responsible for injury to American citizens in Cuba, etc. Until such a state of facts arises, we cannot recognize the independence of Cuba.

(2.) Short of this, the Cubans may set up a government in part of the island, with an army, navy, and courts, and with a government capable of dealing with other governments, and drive Spain out of that part of the island, and in this case we should have to recognize this part of the island as a belligerent state, and accept the position of a neutral, with our ships subject to the right of search; and if the belligerency collapsed, we should have no one to look to for injuries to American citizens in this part of the island, any more than foreign nations had for injuries to foreigners in the Confederate States when they were recognized as belligerents.

(3.) There may be a rebellion, insurrection, or revolt, as there is, and in this case we are not neutrals, but a nation at peace with Spain, and having Spain to look to for injuries to American citizens, and as fully at liberty to trade with Cuba as with any other country. In this case, all we have got to do is to see that the insurgents do not use our territory to make war, and this obligation is merely an obligation to keep the peace. The fact of this rebellion may be proved by executive proclamation, and the law must always be enforced. Such is the fact and such is the law. Congress will be confronted with both, even though McKinley be President and Sherman Secretary of State.

A GREAT MEASURE.

A BILL has been introduced in the Senate at Albany making it unlawful for any person "to advertise for sale or to sell any article at less than its cost price, or at a price so low as to injure the business of another merchant." It is said to be aimed at "bargain counters," and, for all we know, may be a joke of the introducer or some of his friends who wish to cast ridicule on the anti-combination legislation now so common. Or it may be a job or piece of blackmail. It is one of the misfortunes connected with our present system of government that there is no systematic classification of legislative proposals, such as would give a clear idea of the real nature of the proposition involved. Measures are still merely designated as House Bill No. 1, Senate Bill No. 2, and so on. What they ought to have printed on them is House Joke No. 1, Senate Job No. 2, House Strike No. 3, Senate Blind No. 4; this would make everything plain, and give notice to those interested in the measure what sort of arguments should be used pro and con. If this system of classification were introduced, under what head would this bill fall?

We do not know; but whether joke, or job, or strike, or blind, or mere folly, we wish it could be debated and discussed, because it really puts in a few words the principle underlying the great anti-Trust movement which is now carrying all before it. What is so repulsive about Trusts and department stores, and all similar combinations, is not that a number of people combine to secure an end (for this is, so far as it goes, a democratic thing to do), nor that the articles in which they deal become cheaper and cheaper (there is not a single one that is not much lower than it was ten years ago), but that they make it more difficult for the small individual dealer or producer to make a living than it would be if he could only prevent prices from falling. We are all individual dealers in or producers of something, and what galls us is that some one is always offering it at a price a little lower than our own. Newspapers, for example, are sold for one and two cents, and this interferes distinctly with the strictly constitutional business of selling one for three cents. Obviously there is hardship here, and the same hardship exists wherever anything is produced or sold. What we like about this bill is that it goes to the root of the matter, and declares that any one who sells anything anywhere so low that it injures the business of any one else, shall be punished. Of course, selling below cost is prohibited because it is really no better than giving away. It may be said that giving away is lawful, but ought it to be? Though we hardly believe the author of the bill knew the fact, gifts themselves might be made a penal offence but for a decision of the Court of Appeals rendered a few years ago.

The bill is of a general nature. There is nothing special or private about it (we hear so much nowadays of the evils of special legislation), and it corresponds strictly with Blackstone's description of what a law ought to be—a rule of action prescribed by the supreme power of the State, commanding what is right or prohibiting what is wrong. If there is anything that is wrong, it is interfering with another person's business. If there is anything which is clearly an interference, it is underselling him, whether on a "bargain counter" or anywhere else. The bill is also a highly democratic measure, because it enforces equality where it has never yet

succeeded in obtaining a foothold—in prices; and for the future makes it impossible that the price of an article in one shop should be any higher than in any other.

The great difficulty the enemies of Trusts have always encountered is that an anti-Trust law, though it looks well, is difficult of enforcement. There have been stringent anti-Trust laws on the statute-books at Washington and in the various States for years, but they are not enforced, and the only explanation offered by the newspapers is that all the attorney-generals are corrupt. Even when not corrupt, the court generally finds that the law interferes with some disgusting natural right to make contracts or earn a living or compete. That is, the very laws designed to make competition easy are set aside because they interfere with it! There would be just the same trouble about suppressing the department stores.

But this bill goes down to the very roots of social life. It is based on a rule as old as Bracton, "So use your own as not to injure another's," which applies not to Trusts, department stores, or corporations, but to the individuals who carry them on, who distribute their products, who sell their goods. It says nothing about combination or monopoly, but forbids any one to sell at a price so low that it will injure any one else. The person injured will at once put in an appearance wherever undersold, and simply insist on a restoration of former prices. If not, the right to sell at all will no doubt be at once taken away. Of course prices *would* be restored, for nobody would sacrifice his right to sell altogether merely to keep prices down. Thus prices would never change; and all this without any elaborate machinery or trouble about proof. Of course, objections may be urged against the bill—objections may be urged against any bill; but to our mind it is the most thorough of its kind that we have seen yet, and we have examined a good many.

ITALY AND CRETE.

ITALY, February 20, 1897.

CARDUCCI, invited by its President, Colonel Bedette, to join the Bolognese committee formed for the collection of adhesions to, and subscriptions for, the cause of Crete, answers:

"SIGNOR COLONELLO. I consent.

"Suddenly, to derange the carnival of cowardice whirling high and low in Europe, Greece, lance in hand, severe, serene, secure like her Goddess Pallas, has alighted in its midst. Glory be to her! The grand memories of Themistocles, Thrasybulus, Epaminondas, the great names of Canaris, Byron, Santa Rosa, seem to breathe afresh, stirring like an October wind the marshweeds of this cemetery of Western souls. And Italy? She sent no avengers of her fallen sons in Africa because, it was said, Italian arms must be reserved for quite other causes and enterprises in Europe. Now we are 'present' and expectant.

"GIOSUÈ CARDUCCI."

The poet goes, as ever, straight to the heart of things; points to the deed to follow on the word. However diverse may have been the opinions on Italy in Africa, there is but one on Italy's duty in the East. There she must uphold the principles that informed her own struggles for liberty and independence, affirm the rights of the Cretans to throw off the Moslem yoke and rejoin the mother country, Greece. The importance of the issue is so thoroughly realized that factions and parties are silent on all others. The African question, the bank trials, even the general elections and the unknown "platform" of the Government, excite but secondary interest. The first and third pages of the papers are devoted to news from Crete, the action of the Powers, the varying phases of Russian, Austrian, German opinion, to lists of committees formed in every city headed by Milan, Genoa, Naples, by Bologna, where 1,000 well-known names appear, among them those of the Syndic and all the noted professors of the University; Rovighi offering to go to Crete as volunteer surgeon. There is a quiet, practical spirit underlying the real enthusiasm for Crete that has been steadily growing since insurrection first broke out more than a year ago.

"Crete wants money and arms, not volunteers," say the old Garibaldian chiefs in Genoa, where Stefano Canzio unfurls the flag of the Thousand; in Milan, where Maiocchi, who left his right arm on the Volturno, presides. They know by experience that men are plentiful, money scarce, in revolutionary camps; besides, they have the situation well in view. Crete in arms wanted only what she has now attained—leaders from Greece, the certainty that the mother country would not abandon her. The twenty war-ships riding in the Cretan waters signify for her that Turkish troops will not be allowed to land; the blue-jackets who have landed in Candia and Canea, Retimo and Sitia, *i. e.*, in the chief cities of the island, where alone the Moslem populations are in a majority, will at least prevent them from baking any more Christians in the oven, while Colonel Vassos continues to organize the Christians, peasants, fishermen, and mountaineers who occupy 800 villages, and number 250,000 of the 280,000 total population. All is so like our own old times—the same tactics, the same strategy. Prince George does not pounce down and take possession of the island; it is the inhabitants who, at Retimo, etc., proclaim the downfall of the sovereignty of the Sultan, the union of Crete with Greece. No! Italy need send no fighting men; arms, money, even clothing will be welcome. But what Greece prizes most is the universal expression, by veterans, monarchical clubs, students' associations, of approval and adherence to her cause endorsed by such men as Sydney Sonnino and Cavallotti (what other cause could have, even for an instant, united these old friends turned foes?), Bovio and Carducci, Imbriani and Turati, Moderates and Republicans, Conservatives and Socialists—all Italy, in short, save holy Mother Church, which, from the earliest times, with the Christian Powers that obeyed her, was ever more hostile to the Greeks than to the Turk, and to-day prefers a "faithful" fanatic to an orthodox Greek, especially since his patriarchs have scouted union with Rome till she, the impure perverter of Christian principles and apostolic doctrines, return a penitent wanderer to the fold.

The *Opinione*, special organ of the Premier, while imploring the people of Italy not to attempt to force the hand of the Government or present Italy to the Powers as desirous of war in Europe, says of the ranking naval commander in the East that "Canevaro is worthy of his mission, and will hold aloft the Italian name and prestige in seas where the banner of St. Mark, respected and feared, floated for eight centuries." Hitherto Italy has had no sins of commission against Greece as have all the other Powers of Europe. For five and twenty years (1644-1669) Venice fought for Crete, and Crete for Venice, against the Turks, and in 1715, when the grand army of the Turks attacked Corinth. When the Morea returned, by the peace of Passarowitz (1718), to the Turk, Italy and Greece for half a century became mere geographical names in Europe. In the present century their revolutions have coincided (1821, 1831). Navarino and Adrianople secured to Greece the name of a nation. In 1844 the Bandieras failed just as Russia recalled her ambassador from Athens. 1848 and 1849 were years of noble efforts and disheartening failures for European nationalities. When France and England fought to save the Turk, Italian sentiment and the majority of the Piedmontese were violently opposed to any participation in the war. Mazzini in Italy and England denounced the shame and dishonor that must ensue. When England restored the Ionian Isles to Greece, the joy and gratitude of the Italians were warmly expressed. In 1866 numerous Garibaldians, after the exodus from the Tyrol, went to the assistance of the Cretans during their fiercest revolution, and applauded the joint resolution of the United States in 1868 when they affirmed, "in the name of Christianity, civilization, and humanity, the civilized world ought to bring pressure to bear on Turkey and thus terminate the struggle in Greece," sending their ships to receive the fugitives that were denied refuge on board the English and French vessels.

In 1876 Garibaldi wrote to Celso Cerretti, who commanded the legion of old Garibaldian volunteers in the Turco Serbian war:

"All that is generous in the world ought to contribute to the liberation of Christian slaves from the hideous despotism of the Mussulmans. Assist all the populations, from Crete to the Pruth, to break the accursed yoke. Go on, accept aid wheresoever it is offered until the Turk be thrust beyond the Bosphorus; then form a confederation of free states whose frontiers shall be the Save, the Danube, the Black, the Ægean, and Adriatic Seas."

After the Turco-Russian war in 1877-78, Italy saw in Russia only the champion of nationalities. Conservatives such as Bonghi protested against the sentimental pity shown for Turkey, asking why "hideous cruelties perpetrated by a bad, weak Power should be condoned when the same infamies committed in the hour of its strength had been so strongly censured?" At the Congress of Berlin, Italy's spirit was willing, but her flesh was weak. The Cretans had proclaimed the independence of their island and union with Greece for the fourth time, and sent a memorandum to the Congress, vehemently demanding support. Italy had pledged her word to support them. Lord Salisbury had affirmed that Thessaly, Macedonia, and Crete must be annexed. When he backed out, the Cairoli Ministry merely joined the French Government in demanding that the Porte should be requested to settle the frontiers with Greece "No foreign minister of the Conservative party would have played such a contemptible part," said their partisans. Well, Visconti-Venosta, the last of the old guard, is again at the helm, and now is the time for him to show his *nobiltà*.

The French ministry is in a cleft stick; Phil-Hellenes and Greek creditors are all in favor

of Greece. Germany is playing down to Austria, who, watching Salonica with greedy eyes, of all things dreads an uprising in Macedonia, which, says the folk-lore song, she will surely have when "lions have become lambs"; and surely covetousness blinds her policy, as any coercion of Greece or Crete will result in Greek troops and volunteers and the fugitive Cretans rushing over the borders and away. It is useless to propose "self-government" or autonomy for a people determined on national unity. This was proposed in Tuscany, advised to join with Central Italy and Modena. No, said Ricasoli, we have just renounced our old autonomy of centuries in the name of Italian unity. As for giving Crete a prince to be named by the Sultan, as in Samos, where the 42,000 inhabitants pay an annual tribute of $5,000 to the Porte, the idea is too absurd. What prince named by the Sultan could hold Crete in leash? Neither Prince George nor any member of the royal family of Greece would reign subject to the Sultan; what other prince in Europe would accept and be acceptable? Italy's experience in 1849, when princes were enthroned or restored by force, may save Europe from future errors. J. W. M.

Correspondence.

PRIORITY IN WELL-DOING.

To the Editor of The Nation:

Sir: I find in the last issue of the *Nation* the statement that "the Newark free public library is the first, as far as the public knows, to take a stand against the degradation of the press by refusing longer to admit to its reading-room two of the worst offenders among the daily newspapers of the country." The directors of the South Norwalk free public library and reading-room took similar action several months ago in dropping the New York *World* from its list of periodicals for the current year. *

South Norwalk, Conn., March 4, 1897.

A GRIEVANCE.

To the Editor of The Nation:

Sir: In the January issue of the *Cosmopolitan*, the photographs illustrating my article "German Students and their Absurd Duels" were reproduced without my consent.

These photographs I obtained from a German friend, with the understanding that they could not be reproduced, being genuine, and on the back of each was written "Verboten hervorzubringen." After finding out that they could be used for *sketches*, in August last I sent the article and photographs to the *Century Magazine*, enclosing a letter in which I said that certain designated photographs could be used only for sketches. The article was returned to me, with a courteous letter from the editors, to this effect, that, since they would not be allowed to reproduce the photographs, they did not want to consider it.

Later I sent it to the *Cosmopolitan*. I carefully explained in a letter that certain designated photographs could be used only for sketches. After waiting six weeks, I wrote a letter to the *Cosmopolitan*, asking them, if they did not wish my article, to please return it at once. Almost by return mail I received a letter saying they were considering it for early publication. A week later (November 23) they wrote again: "The *Cosmopolitan* would be pleased to accept your article if an honorarium of $— would be satisfactory." I replied I would accept the honorarium, and also again stated, "I think you understand those photographs with the statement written on the back, 'Forbidden to be reproduced,' can only be used for sketches." To this there was no reply, nor were any proof-sheets sent me for correction; but when the January number of the *Cosmopolitan* appeared, it contained my article and the reproduction of six of the forbidden photographs.

I wrote at once, asking for an explanation. They replied that they had seen no letter of mine, nor any request not to use the pictures, and, as they did not read German, did not know what might have been written on the back of the pictures. In reply, I asked how they knew I would accept that honorarium (which had been paid) if my second letter had not been read. As to their not reading German, for the benefit of the unenlightened I had written on the back of one of the photographs a translation of "Verboten hervorzubringen." I then asked, in justice to my German friend and myself, for a public explanation. The only satisfaction that I received from them was an intimation that it would be entirely satisfactory to them for me to publish my grievance elsewhere. As the February and March numbers have appeared without an explanation or apology, it seems necessary for me to adopt their suggestion, and I ask your space for this purpose.

Katharine Farrand Reighard.

March 2, 1897.

TOADYING.

To the Editor of The Nation:

Sir: I observe in yesterday's *Nation* some inquiry as to the origin of the verb "to toady," this verb being equivalent to those other words which represent fawning or flattering for personal advantage. I had always been curious concerning the origin of this word. I could find it in no old English dictionary, and not even in Worcester, and, where I did find it, no attempt was made to account for it.

In the spring of 1853 (if I remember the date correctly) Dr. Daniel Wilson, then Professor of English Literature in Toronto University, went to meet his wife and children, just arrived from Edinburgh in New York. He left me, as his nearest friend, in charge of the house he had taken in Toronto, where I was then living. This house had not been occupied for several years, and the areas in front of the basement windows were solidly packed with sand. It was necessary to watch the Irish laborer who used the spade, and, at the risk of being laughed at by lexicographers, I will tell you what occurred.

When the spade had reached a depth of eighteen inches, its load dropped with a heavy thud, and the sand, parting, disclosed an enormous female toad. It was certainly six inches in length. We at first supposed it to be dead, but, as we disinterred it curiously, ten tiny little toads began to creep out from under her, and to slowly crawl over her back. The weather was still cold, but the thin skin of creatures no bigger than an English shilling soon yielded to the warmth of the hot sun. As soon as they regained a full activity, they began a process of extensive massage, working with their feet for more than half an hour before the thicker epidermis of the adult conveyed the vital warmth. The whole process, so long continued, was so suggestive of fawning or coaxing that I turned to Prof. Chapman, who stood near, and said, "Well, I shall never have occasion again to ask what *toadying* means." "No," he said; "we have here a practical illustration."

When the matter was mentioned to Dr. Watson he thought it very likely that the word had a rustic origin, as it was hardly possible that farmers should not have observed something of the sort. This will interest naturalists, if it only amuses lexicographers.

Caroline H. Dall.

Washington, D. C., March 5, 1897.

THE UNIVERSITY OF CALIFORNIA.

To the Editor of The Nation:

Sir: Since my letter of February 11 was forwarded to you, the biennial report of the Superintendent of Public Instruction of California for 1895 and 1896 has appeared in print, and I hasten to supplement my recent communication with the following official announcements:

The report states that there were, at the close of last year, 98 State high schools in California—26 schools with one, 23 with two, 23 with three, and 26 with four or more teachers to each school. None of the first class are accredited; 10 of the second, 17 of the third, and all of the fourth class (26) are on the favored list. To these 53 State schools are to be added 14 private schools, and we have then the number of accredited schools (67) as given in the report. Of these schools 50 are accredited in ten and more studies, 24 in twelve and over, and 13 in fourteen, fifteen, and sixteen studies.

These statements will no doubt explain to your readers "the wonderful growth of the University of California and its *peculiar* [the italics are mine] system of accrediting" to which your Eureka correspondent so proudly refers in your issue of February 4 last. *Sapienti sat!* A Californian Teacher.

February 27, 1897.

Notes.

Capt. Mahan's 'Life of Nelson' is set down to appear next month from the press of Little, Brown & Co. It will be illustrated with nineteen portraits and plates in photogravure, and twenty-one maps and battle-plans.

A. S. Barnes & Co. have in preparation 'The Annals of Switzerland,' by Miss Julia M. Colton, and 'The History of the Waldenses,' by Mme. Sophia Bompiani.

The New Amsterdam Book Co. will shortly bring out an unpublished work by the late Capt. Sir Richard Burton, on 'Human Sacrifice among the Sephardim, or Eastern Jews, with a portrait of the author.

Ginn & Co. announce 'A Few Familiar Flowers,' by Margaret W. Morley.

Copeland & Day issue immediately 'The Husband of Poverty: A Drama of the Life of Francis of Assisi,' by Henry Neville Maugham.

A new volume of poems, 'Odes in Ohio,' by John James Piatt, is about to be published by Robert Clarke & Co., Cincinnati.

E. P. Dutton & Co. will publish 'Beyond the City Gates,' a novel of early New York life, by Augusta Campbell Watson.

Patrick Geddes & Colleagues, Edinburgh, have in hand a new edition of Miss Fiona Macleod's 'Tales,' rearranged and extended,

in three volumes, designated respectively as Spiritual and Barbaric Tales, and Tragic Romances.

By way of celebrating its twenty-fifth anniversary the house of Ulrico Hoepli at Milan will bring out 'La Divina Commedia di Dante Alighieri, illustrata nei luoghi e nelle persone,' by Corrado Ricci, with thirty plates and 400 illustrations (New York: Lemcke & Buechner). The collection of these pictures of persons, places, mountains, rivers, castles, statues, tombs, etc., was begun some eighteen years ago, and is largely original and photographic, even to the taking of these views "nel punto rispondente al concetto dantesco." The examples given in the prospectus show that this is no whimsical undertaking, and that the book will be a treasure to the lover of Dante.

Together with the customary 'Annual Catalogues' of American and English publications for 1896 bound in one volume—the American containing both subject and author-indexes—we have from the same office, of the *Publishers' Weekly*, the correspondingly useful 'Annual Literary Index' of 1896, edited by Messrs. Fletcher and Bowker. It embraces, we may remind our readers, both periodicals (American and English) and collective works like volumes of essays, whose contents are thus made immediately available. It takes account, also, of bibliographies and necrology, and chronicles leading events. Not the least noteworthy feature is the author-index, which shows the select activity, at least, of the various writers whose articles and essays have been already alphabetized, and their respective mediums of publication.

A worthy compeer of *Minerva* (which in the nature of things can take but imperfect cognizance of our academic system and personnel) is Mr. Edwin Emerson, jr.'s, *College Year-Book and Athletic Record* for the academic year 1896-97 (New York: Stone & Kimball) To *Minerva* Mr. Emerson properly returns his thanks for the main scheme, and proceeds to give an alphabetical catalogue and description of all American (*i. e.*, United States) universities, colleges, and schools of learning qualified to confer collegiate degrees. He supplements this information with miscellany regarding degrees, college fraternities, colors, yells, publications, politics, together with university extension and statistics of education and illiteracy. An athletic record follows; and an index of all the professors, instructors, and college officers closes the laborious compilation. The typography is most tasteful, the presentation logical and compact. We have seldom seen the initial number of any enterprise more indicative of settled purpose or more prophetic of permanence so far as merit can command it. Doubtless errors could be found by scrutiny, and we have casually encountered them—the mass of names, facts, and figures is too great to permit of perfect accuracy; but the second issue may be expected to be freer from errors than the first, after an exchange of proofs. The index fills 30 pages in triple columns. Many interesting comparisons may be directly made by means of the line of figures as to income, students, instructors, buildings, and books which regularly succeeds the title of the college. Thus, Smith College (for women), founded in 1875, has $17,000 more income than the neighboring Amherst, founded in 1821, and nearly twice as many students and instructors; less than half as many buildings and books.

The third volume of Boston "Old South Leaflets" is freighted with twenty-five more significant documents relating to our history; Sir John Eliot, Pym, Cromwell, Milton, and Sir Harry Vane being side by side with 'New England's First Fruits,' extracts from Cotton Mather's 'Magnalia,' Gov. Hutchinson's account of the Boston tea party, Hamilton's Report on the Coinage, The Monroe Doctrine, etc. Even Columbus's Memorial to Ferdinand and Isabella on his second voyage, and the Dutch Declaration of Independence in 1581, occur here. This inexpensive library of reference having a growing importance, we think it desirable that each volume should contain a complete index to the contents of the series.

The Cambridge Edition of Lowell's Complete Poetical Works (Boston: Houghton, Mifflin & Co.) is a welcome adjunct to the Browning and Holmes, the Longfellow and Whittier, of the same series, and has been edited in the same praiseworthy manner, and with exceptional interest, since Lowell's prose-remains afford such full and varied material for the annotator. This single volume, whose price brings it within everybody's reach, contains the posthumous last poems which were edited by Prof. Norton. It concludes with a chronological list of the poems and with indexes of first lines and of titles. The embellishments are a photogravure portrait of the later Lowell and a vignette of Elmwood.

The new two-volume edition of the 'Poems of Henry Vaughan, Silurist,' which is the latest issue in the excellent "Muses' Library" (London: Lawrence & Bullen; New York: Scribners), may be described, in old-fashioned phrase, as "by several hands." The text has been cared for by Mr. E. K. Chambers and Mr. Gordon Goodwin, both favorably known in connection with this series. Mr. H. C. Beeching contributes an introductory essay, brief and judicious. To supplement this, Mr. Chambers furnishes a forty-page "Biographical Note," full of minute and curious information. To the same indefatigable pen we are indebted for the bibliography and the notes. The latter are brief, and give particular attention to the parallels between Vaughan and George Herbert, for some of which the editor is indebted to an essay by our accomplished compatriot Miss Louise Imogen Guiney. Section *d* of the "Biographical Note" is devoted to that strange personage Thomas Vaughan, the poet's brother, who leads Mr. Chambers far afield—as far, indeed, as the whole question of modern French Satanism and the vagaries of "Miss Diana Vaughan." Those of our readers who meet these curious matters for the first time will be diverted; others, who have read the *Procès des Templiers*, will doubtless agree with Mr. Chambers in suspecting that he has taken Miss Diana too seriously. However this may be, it is probably well to have these things on record in a place accessible to literary students.

Prof. Grant, of Yorkshire College, Leeds, has performed a service in editing Canon Rawlinson's translation of Herodotus in two handy and comely volumes (Scribners). He has turned the Roman names of deities back into Grecian, but has otherwise left the text substantially unimpaired; has omitted the appendixes altogether, and has abridged the notes on a sane principle involving no real loss. Some new maps in the letterpress, of Marathon, Thermopylæ, Platæa, and Salamis, explain those battles. The brown cloth bindings are simple and effective.

Something less than a year ago our French correspondent reviewed at length in these columns the Memoirs of Marshal Oudinot, and the work now appears Englished by Alexander Teixeira de Mattos in one volume (D. Appleton & Co.). The version, if not strictly idiomatic, is fluent, the print is large, and there is a good index. There are photogravure portraits of the Duke and Duchess of Reggio.

The two volumes of 'Occasional Papers' of the late Dean Church, which his daughter has collected and the Macmillans publish, consist almost entirely of reviews of books contributed to the *Guardian*, the *Saturday Review*, and the London *Times*. Miss Church has saved little of a merely ephemeral interest—though some of the ecclesiastical questions discussed seem now dead enough—and it is not only the Dean's friends who will find much to interest them in these gleanings from his casual work. Those familiar with his writings will expect to find here the knowledge, the judicial temper, yet the incisive force which mark Dean Church's style, nor will they be disappointed. In addition they will find some interesting bits of personal portraiture. The characterization of Mark Pattison, for example, is powerful, and impresses one as somehow striking nearer to the centre than do Mr. Tollemache's more leisurely notes on the Rector of Lincoln.

Mrs. Bernard Bosanquet's 'Rich and Poor' (Macmillan & Co.) is intended for English readers; but it is so full of wisdom that we can most earnestly commend it to the charitably disposed of this country. One of its merits is that it is written, as Mrs. Bosanquet says, in such a way as to avoid economic controversy, although by no means so as to suppress the "economic conviction" that character "is one amongst other economic causes, and as such cannot fail to have an economic effect. In other words, I maintain that if you can make man or woman more honest, sober, and efficient than before, he will not only be more likely to find an opportunity of rendering services to the community (*i. e.*, to find work), but will also, by his higher range of wants, increase the opportunities of other people (*i. e.*, increase the amount of remunerative employment)." This passage indicates the spirit of the book, and we shall only add that in her sobriety of judgment, intelligent recognition of the lessons of experience, and due estimate of what is both desirable and practicable in attempts to uplift those who are cast down, Mrs. Bosanquet has set an admirable example.

The astonishing differentiation which characterizes modern science is illustrated by Prof. W. Biedermann's (of Jena) 'Electro-Physiology,' translated by Frances A. Welby and published by Macmillan in an octavo of more than 520 pages. This is devoted to the theory of the electrical excitation and to the electro-motive reactions of excitable tissues. Nine-tenths of it is taken up with the structure, the change of form under activity, the excitation and the electro-motive action of muscle, and the other tenth with the electro-motive action of epithelial and gland cells. We can only present it to advanced students as the latest exposition of this segment of physiology, without further comment than that the style is not as simple as one might hope for in English, and that the book will probably remain the standard authority, despite, or perhaps because of, its technicality, for a long time to come.

Dr. S. E. Reynolds's 'Hygiene for Beginners' (Macmillan), which is fairly described by its title, includes an outline of anatomy and physiology, and its statements may be accepted.

Although specially written for the climate and conditions of England, the higher-grade common schools of this country may conveniently use it. The moderate diffuseness of style may not be a disadvantage to pupils who do not care to have their facts packed too closely.

Serious-minded cyclists will find in 'Bicycles and Tricycles,' by Archibald Sharp (Longmans), a sober and intelligent source of instruction in the mechanics of cycle construction and behavior. The book is illustrated with numerous and excellent cuts. The 530 pages are divided into three parts: Part i. is a formal presentation of elementary mechanics, with examples taken from the wheel; Part ii. contains an account of the historical development of the various types of cycles and a discussion of the problems of stability, steering, resistance, etc.; while Part iii. (256 pages) deals with the numerous details of construction.

John Lane (The Bodley Head) announces that, beginning with the present month, the London *Studio* will appear simultaneously with the English edition from the above office in New York, differing in contents only in a special American supplement conducted by Ernest Knaufft.

A remark of Washington Irving apropos of Cooper combines truth and brevity in such a degree as to entitle it to a place in all collections of epigrams on the literary profession. Mr. M. A. D. Howe thus quotes it in the March *Bookman:* "In Irving's diary, a few weeks before his death, he wrote of Cooper, 'In life they judge a writer by his last production; after death by what he has done best.'" Mr. Howe ought to have been either more or less particular in his citation; he should have omitted the quotation-marks or else given the remark as Irving wrote it, which was not in his diary, shortly before his death (that is, in 1859), but soon after Cooper's death, in a letter dated October 6, 1851, addressed to the editor of the *Knickerbocker Magazine*. Here it is as published in November of that year: "When an author is living, he is apt to be judged by his last works, and some of those written by Cooper in recent years have been somewhat cavilled at. When an author is dead, he is judged by his best works, and those of Cooper excited enthusiasm at home and applause throughout the world."

The Chicago monthly illustrated magazine, the *International*, begins in the March number a new feature called an "international register" of first-class passengers leaving American for foreign ports, together with a list of vessels and their sailing dates. The names are classified by State and town, with references to the respective vessels embarked on. It is intended to cover the Pacific Coast exodus in time. Such a record, permanently kept up, may come to have an historic utility.

The most noteworthy article in the last *Bulletin* of the Société de Géographie is M. Cuny's account of the Congo Français, its native races and their distinctive customs, the quality of the soil and its productions, and the commercial value of the country. A sketch map shows the distribution of the tribes and the various articles of commerce. In M. Douliot's journal of his travels on the west coast of Madagascar is an interesting passage describing a region in which, he says, "one may go for two days and not see an inch of uncultivated ground nor a free man." The plantations of rice, maize, sorghum, and bananas were tilled by slaves, people of a different race from the ruling classes, the Sakalava. He adds, however, that "the benefactors of humanity need not seek to abolish slavery here, which is disappearing of itself; the masters are dying and the slaves are conquering the land by their labor." There is also a strong appeal for the construction of a railway from Saigon to Bassac on the Mekong, which, it is argued, would make Saigon the principal commercial port of the far East.

Petermann's Mitteilungen for January opens with an account of the twenty-nine principal volcanoes of Salvador and southern Guatemala. This is followed by Dr. Hassentein's notes on the expedition of Dr. Donaldson Smith in Somaliland and Gallaland, in connection with a new map of this region compiled from the most recent sources. Dr. Hassentein characterizes the results of the expedition as "incontestably among the most significant in modern African discovery." A review of the history of Polar exploration is accompanied by a beautiful map showing the boundary of the unknown region around both poles, together with insets showing the progress of exploration during the present century.

At a banquet recently given by the American students in Paris, and presided over by Mr. Eustis, the United States Minister, M. Lavisse paid this compliment to the teaching of the classics in this country: "The instruction of antiquity is so well provided for in your country that the day will perhaps come when European students, wishing to find all the means for the study of Greece and Rome united, will cross the Atlantic"—a prophetic vision, hyperbolic, no doubt, yet seeming less extravagant if the strongly organized classical instruction in our higher institutions be considered by the side of the steady encroachments of modern studies upon the monopolizing power of the classics in the institutions of Continental Europe. The levelling process now at work may ere long reduce M. Lavisse's fancy to a possible reality.

An *enquête* among the medical organizations in Bavaria, like the one made heretofore in Prussia, goes to show that the majority of German physicians still cling to the existing order of things so far as concerns the preparation of medical students. On the other hand, Prof. Dr. Kewitsch of Freiburg pleads earnestly for the admission of graduates of the real-gymnasia to medical studies, on the ground of the more suitable preparation furnished by these schools, and of the undesirable and costly prolongation of the university course, at present nine semesters, with the near prospect of an additional semester—made necessary by the inadequacy of gymnasial education.

—There are several readable articles in the *Century* this month. Gen. Horace Porter does not make his "Campaigning with Grant" more than barely readable, partly because he does not seem to have very much that is new to tell us. His papers are interesting chiefly as a picture of Grant, and Gen. Porter evidently belongs to the school of historians who object to hero-worship. Some people use the adjective "common" as a term of eulogy, as implying an unexclusiveness, a readiness to mingle and fraternize with the common herd, and Gen. Porter would apparently like to have Gen. Grant painted as a "common" man in this sense. There is danger, however, in the attempt, for it was not this quality which made him a great man. Mr. C. C. Buel's "Our Fellow-Citizen of the White House" is valuable as giving an account of the routine of the President's life at Washington. It throws a lurid light on the cares of office. It seems that the President receives in the busy season upwards of a thousand letters a day, and in the dullest times two hundred. Appeals for charity often mount up to twenty thousand dollars a day. A cognate article is Mr. J. B. Bishop's historical summary of "Inauguration Scenes and Incidents." Among other illustrated articles are W. A. Coffin's on the Decorations in the New Congressional Library, and A. R. Spofford's on the Library itself. Capt. Mahan's "Nelson at Trafalgar" completes his Nelson series. We notice that in the text the celebrated signal is given, as usual, "England expects every man to do his duty." The facsimile signal at p. 741 makes it "*will* do" instead of "to do," and gives the flags supposed to represent it.

—In *Harper's*, among the illustrated articles are Mr. C. F. Lummis's continuation of his "Awakening of a Nation," Mr. J. W. Collins's "Decadence of the New England Deep-Sea Fisheries," and Poultney Bigelow's Part V. of "White Man's Africa." Captain Mahan writes about "Preparedness for Naval War"; and though he does not exactly say so, everything that he does say goes to show that the United States never can be prepared for war in the sense that any other great Power now is prepared. To be prepared for war in the sense of the old maxim—if you wish peace prepare for war—means, either to be armed to the teeth on land and sea, or else, in the case of a Power like England, to have a navy equal to the navy of any two Powers that may attack you. Capt. Mahan insists that the United States is "insular," but he does not insist that we must imitate England; and the fact is, to say that we are "insular" is not true. Having Mexico on the south and Canada on the north does not make an island. The great fact about the United States is that no foreign Power would, in the ordinary course of events, ever care to attack it, and therefore if it were to prepare for war, it could only be a war of aggression, which would be entirely opposed to our own interests. That we ought to have a small but good navy may be true, but has anybody ever objected to it? But we shall never prepare for war in order to secure peace, because we know perfectly well that nobody wants to attack us. That is the reason why the politicians bully and threaten and roar so at Washington.

—Mr. Richard Harding Davis contributes to *Scribner's* an entertaining article on the *Banderium* of Hungary—the millennial celebration of the founding of the Hungarian kingdom held last year in Pesth. For any one who cares for pageantry it must have been a fine show; there is less unreality about pageantry the further east one goes in Europe. An Hungarian magnate, as he appears in Paris or at Monte Carlo, may be a quiet, commonplace "cit." In Hungary, attired in his official costume, resplendent with purple and velvet and jewels, and mounted on a barbed steed, he takes the beholder back several centuries. He is a magnate, and probably a great land-owner to boot, with a dependent peasantry, and herds of horses and cattle and buffaloes, and a resident priest to take care of the peasants' souls, and all the paraphernalia of an antique society. Mr. Davis is clearly Hun in his sympathies, for he asks, "What excuse have the Austrian royalties ever offered for their right to exist?" and suggests that the next King of Hungary

may not be an Austrian. This seems rather harsh on Franz Joseph, who is an estimable man; would it not have been fairer to let him see a proof of the article, and to have given him a chance to abdicate quietly before printing his doom? Lewis Morris Iddings's "Art of Travel," a first paper, contains a good many useful hints.

—John Fiske's article on the Arbitration Treaty is the most noticeable paper in the *Atlantic*. He remarks upon the fact that, in the nature of things, it is not at all impossible that, in time to come, sentiment may play a powerful part in favor of peace, as it has in the past in favor of war, between England and America. He points out that, in the days of Alexander Hamilton, there was very little love for the Federal Union in any part of this country; the Federalists, by creating the Union, and binding to its support a group of important interests, called into existence a sentiment which, two generations later, became an ardent love of country, and made the disruption of the Union out of the question. Mr. Fiske calls this a group of "selfish" interests, but we should rather call them social. There is nothing especially selfish in the desire to be more united, to establisb justice, to ensure tranquillity, to promote the general welfare, to secure the blessings of liberty to the community, or even in the desire for common self defence. People grow attached to arrangements which promote these objects, and so in the end come to love the mere name, like that of the Union, which symbolizes them, and are willing to die for it. Patriotism, as a sentiment, grows chiefly in this way; and, on the other hand, a government which steadily failed to promote these objects would end by producing not patriotism, but dislike of the symbol. Thus, some people dislike the name of New York, because it represents to them failure to promote social interests, and predatory and anti-social barbarism. Mr. T. W. Higginson's "Cheerful Yesterdays" are always worth reading, and the number contains a curious article on "Legislative Shortcomings" by Mr. Francis C. Lowell, who has had a legislative experience of two years in the Massachusetts House. Mr. Lowell does not see that, in defending his legislators against the common charge that they are not generally "men of good standing in their several communities," he throws a light upon their real character which shows them to be unfit for the work they are sent to do. The first object of the individual member, he candidly says, is to secure the passage or defeat of a local measure. Everything else is secondary. *Cadit quæstio.* An assembly made up in this way is composed of men who have not the first qualification for legislating. This is, that local interests shall be in their minds secondary to general interests. The Massachusetts Legislature may be the best there is left; but it consists of very poor stuff, *teste* Mr. Lowell.

—We have received the first two volumes (A to AUE) of an elaborate "Library of the World's Best Literature," to be completed in forty-five volumes (New York: The International Society). The editor-in-chief is Mr. Charles Dudley Warner. He has three "associate editors," and is assisted by a "council" of eleven well-known American scholars and men of letters. The plan of this new enterprise is interesting and should be practicable. The intention is to give rather copious extracts from a very wide range of authors, with biographical and critical introductions. The literature of all nations is to be represented, but everything is to be in English. The arrangement is alphabetical. The authors excerpted are very various indeed: Aeschines, Agassiz, Alfred the Great, Miss Alcott, St. Thomas Aquinas, Almquist, W. H. Ainsworth —these names will illustrate the inclusiveness of the project. Mr. Warner's purpose, as he himself tells us in his preface, is not to confine the extracts to authors severely classical, but to furnish a great mass of miscellaneous reading, all of it worth while from some point of view, and to make the collection as attractive as possible. The introductory notes are of all sorts: some are written by eminent specialists, others have the air of being put together "in the office"; almost all, however, seem well enough suited—and some are remarkably well suited—to the purpose of the book. In addition to these extracts from particular authors, the "Library" will contain, in due order, various articles of a more general character. Such are, in the volumes before us, Prof. Toy's "Babylonian and Assyrian Literature," Dr. Gottheil's "Arabic Literature," Mr. Richard Jones's "Arthurian Legends" (not very well done), and others, all of which give not only discussion, but specimens. As this interesting enterprise goes on, we shall of course acquaint our readers with its progress. If it is editorially as well cared for as we hope, it will tend, distinctly, to the encouragement of reading and the cultivation of a taste for good literature among our people.

—At the February meeting of the Oxford Society of Historical Theology, Mr. Louis Dyer read a paper on "Primitive Animism and the Homeric View of Nature." Messrs. Lang's and Robertson Smith's analyses of the animistic stage of religious consciousness were criticised as involving an initial line, drawn before experience, between man and things, and as making the dawning of religious thought a process of obfuscation. The animistic fancies of primitive man came to him, we know not how, possibly along with his experience in dreams as a crude intuition based upon a felt analogy—felt but not understood. Instead of reasoning out the analogy, the savage may have objectified it, *i. e.*, proved it by taking it for granted. Primitive man had no defined or workable notion of himself as a unit apart from his tribe, sept, or clan. The dawning conception of individualized personality connected itself rather with intimations of that higher power which gave sanction to the peremptory rules of taboo. Homer was far away from crude totemistic conceptions and taboo. There might be, however, some survival of the primitive confusion of mind, and failure to individualize, in the composite nature of the Olympian god. In Homer's day the love, the caution, the wonder, and the fear with which primitive man viewed animals, trees, stones, and all nature, had centred upon clearly individualized gods, detached more or less from the kingdoms of nature, but bearing a birth-mark of primitive thought, impersonating among other things the failure of primitive man to draw a clear line of distinction between himself and the rest of nature. Certainly we should hesitate before accepting as exhaustive the commonly accepted and purely anthropomorphic explanation of the Olympians, if it becomes plain that the idea of the individual man as a unit disentangled itself (so far as Homer can show) chiefly in the heroic nature—in connection, that is, with the growing intensity and clearness with which personality revealed itself in the gods. Under their impulse, since all the kingdoms of nature—man, the elements, and the beasts—met in their composite personality, the line of demarcation between a hero and his surroundings grew indistinct at critical moments. This appears chiefly in the similes of the Homeric poems, whose magical effect depends upon the details scrupulously, religiously added, although not relevant in the eyes of common sense or for the purposes of mere illustration—details which betray the poet's intent and devout absorption in the real life of the living animal, the growing plant, or the towering rock summoned by him to act in his story, and there for the space of a moment flashed in to take the place of Menelaus's softening heart, of the unbending will of Achilles, of the stubborn valor of Ajax, or of the untamed savagery of Polyphemus.

—Prof. Dr. Seiling of the Polytechnic Institute in Helsingfors has just published some interesting statistics concerning the higher education and public position of women in Finland. In 1884 a "Frauenverein" was founded for the elevation and improvement of the condition of women, and in 1891 a second society, called the "Union," to which men were also admitted, was established for the promotion of the same object. For more than a quarter of a century the gymnasia have been attended by both sexes, and the first woman completed the prescribed course of study and passed her examination (the so-called absolutorium) in 1870; at present from forty to sixty girls pass the same ordeal every year. These gymnasia are the best educational institutions in Finland, and have a much larger number of female pupils than the ordinary high schools for girls, although the tuition fees in the former are twice or three times as great as in the latter. The University of Helsingfors has now over two hundred women attending the different courses of lectures as matriculated students. In 1882 the degree of M.A. was conferred for the first time upon a woman; and another woman has been for several years one of the leading physicians of Helsingfors. The women of Finland are not conspicuous for literary talent: the number of authoresses is relatively small, being about thirty. On the other hand, the number of artists is remarkably large. Fully 40 per cent. of the persons represented in the art exhibition held at Helsingfors in the spring of 1896 were women who devote themselves with zeal and success not only to painting, sculpture, and music, but also to architecture.

—The 'Handbuch des Finnländischen Frauenvereins,' recently issued, contains biographical sketches of more than six hundred women who have distinguished themselves or are still prominent in public life. They enjoy the elective franchise in local or communal affairs, and are eligible to office as members of school boards and as councillors and directors in the administration of almshouses and other charitable institutions. About one thousand women are now employed in post offices, railroad and telegraph bureaux, and other departments of the public service; more than nine hundred are engaged as teachers in schools of various grades, and it is not uncommon to see among their pupils young men of eighteen who are preparing for an academical or commercial career. Three thousand at least are in banks or in trade, and more than one-third of these are either owners or independent managers of the business. Of the eighty poorhouses in Finland, fifty-two have female

superintendents; many landed estates and all dairies are directed by women, who, in a few cases, have also founded and carried on important manufactories.

THE ENGLISH DIALECT DICTIONARY.

The English Dialect Dictionary. Edited by Joseph Wright, M.A., Ph.D., Deputy Professor of Comparative Philology in the University of Oxford. London: Henry Frowde; New York: G. P. Putnam's Sons. Part I. [July, 1896], *A* to *Ballot;* Part II. [December, 1896], *Ballow-Blare.*

THE scheme and typographical appearance of this invaluable work were briefly set forth in these columns on receipt of the first part. Now that the second part is in hand, we have a goodly portion of the whole Dictionary, and may form a judgment of the manner in which it has been, so far, executed. It may be said at once that Professor Wright is a signally competent editor, and that his work is of enduring excellence.

This Dialect Dictionary deals, of course, with dialect words and uses; but let no one infer that it deals only with words and uses unfamiliar to the literary and colloquial speech. Indeed, its greatest value, to all outside of the small circle of special students of dialect, lies in its abundant and interesting additions to the accessible history of well-known words of the common literary language. Nearly all the words of the old stock of the literary language appear in these pages, with the old senses set forth more fully, or with new examples, in connection with provincial uses. Thus, *acold*, *acorn*, *acquaint*, *acquaintance*, *acquainted*, *acrazed*, *acre*, *across*, *act*, with other well-known words, interspersed with a few unfamiliar terms exclusively provincial, occur within the compass of two pages. So *batch*, in various applications, *bay*, to bark, *beetle*, a mallet, and such words, are fully treated. *Beetle* has a column and a half. The atmosphere is dialectal, but it is also literary. The longest article in these two parts is that on the immortal verb *be*—called in Noachian days "the verb *to be*." The article is nine and a half columns long, but of its kind it is appallingly good. Its kind is tabular. It is a muster of forms. The procession of thought is not conspicuous, but the absence of this feature will not seem to the reader of "dialect stories" an unfamiliar deprivation. The aim is different. For example, any one who wishes to know how the verb *be*, with its supplements *am* (*art*, *is*, *are*) and *was* (*were*), has flowered out along the hedges of rural speech, may find here gathered a nosegay of all the varieties.

The vocabulary is widely inclusive, both of words and of forms. Variant forms having the status of independent words are freely entered; but here a defect must be noticed. Such variants of independent status as *alablaster* for *alabaster*, *ax* for *ask*, *ache* ("written also *aitch*" and pronounced ētsh), the older word for *ake*, which has recently usurped the spelling of *ache*—these are separately entered; but the two dialectal variants of *acorn*, namely *atchern* (*atchorn*, *achurn*, *aitchorn*, *hatch-horn*, etc.) and *aker* (*acker*), are drowned in a lake of quotations under *acorn*. Surely *atchern* should be separated from *acorn*, as *church* is separated from *kirk*, and as *ache* (ētsh) ought to be separated from *ake*. The editor puts under the one form *against* the distinct and older but still existent form *agains* (*agens*, *agins*). Under *among* he mentions the Scotch forms *imangs*, *imangis;* these should go under *amongs*, which is, however, not entered; and *amongs*, if deprived of its own place, should, in the conventional arrangement which the editor follows, go under *amongst*, not under *among*. So *backward* and *backwards*, which the editor properly separates; and so should be entered *beside* and *besides*, which the editor compendiously enters under one head, "*beside(s.*" No doubt these peccadilloes were due to the instigation of the great demon "Space." The reason for the separation of separate forms is clear when stated. The etymology is different. The forms and dates are always different; the uses are very often different; the proofs are different. It is incumbent upon all makers of English dictionaries, and especially of English dialect dictionaries, to rescue these submerged and huddled words, and to give them each its own place (is it not a little one?) and label.

The system of phonetic notation to show pronunciation is clear and good. The editor comes to the conclusion, "after making many experiments," that "an elaborate transcription is useless to people who have not had a practical training in phonetics," and adopts, as all scholars must who have studied the problem and made the experiments, the historical English notation—that is, the system which retains the old English, the so-called "Continental" or "Roman," values of the vowels. This is the system formally recommended by the American Philological Association in 1876, under the leadership of Profs. March and Whitney. It has been introduced by Prof. March into the latest American dictionary, is used, with considerable elaboration, in the Oxford English Dictionary, has been adopted by the American Dialect Society, and is everywhere employed, with unimportant variations, by philologists who have occasion to deal with spoken English. It may now be regarded as established. It is not likely that any scholar will ever again put forth an English dictionary in which the old Webster-Worcester-Ogilvie-Stormonth notation shall be used.

The most original part of a good dictionary is its quotations. In this dictionary the quotations are very numerous. The arrangement of them is not by date (the order of date would be of slight importance when most of the quotations are of the present century), but by "dialect"; and the dialects are determined, not by any phonetic or philologic principle or individual classification, but by the severe simplicity of place. The dialect spoken at the top of the map is placed first, that spoken an inch below next, and so across and down. This is the true "classification" by which to find what you want. The order is illuminating. Geography is no mean classifier. Order may be heaven's first law, but earth's first law is geography—seas, continents, islands, mountains, lakes, rivers, plains. Everything happens in these, or in the circumambient air. By the addition of small superior figures, ^{1}, ^{2}, ^{3}, ^{4}, etc., the abbreviations that express locality and dialect are made to serve as references to the best glossaries of the respective dialects, as given in a "select bibliographical list." This is another sacrifice to the demon "Space," but it works well enough. There are many places, however, where careful attention is required to determine to what quotation a given reference belongs. This trouble could be avoided by a vertical line or a dash between the otherwise unseparated items.

The quotations are often from the only edition of the work cited. When there are several editions no attempt seems to be made to cite the earliest. Thus, there are quotations from "Ash, 1795" (under *barse*, *bash*, *basil*, *bawbee*, etc.). Why not quote the first edition, 1775, where the same entries, some of them fuller than those quoted, appear? There are quotations (under *base*, etc.) from "Grose, 1790," which appear in the first edition, 1787. Under *barnacle* and *beast* there are references to "Robertson, *Phras.* (1693)." The entries are in the first edition of the *Phraseologia*, 1681. But this means that the editor has used the editions at hand, or has accepted the quotations sent to him. This is mere common sense. It were idle to attempt to give the earliest instance in every case.

A dialect dictionary might be expected to take some notice of the "realistic," if not real, "dialect" manufactured for us by the artists in this sort; and here we have some, the best and others—Mr. Hardy, of course, and Mrs. Ward, the kailyard crop, Mr. Barrie, Mr. Crockett, Mr. Watson, and the other crowding immortals of the passing hour. But Mr. Watson is unscientifically called "Ian Maclaren," without the quotation-marks, and without mention of his real name (under *argle-bargle*, *aye*, etc.). To a lexicographer, who should be above all an historian, a teller of the truth, pseudonyms are or should be merely individual whims or pleasantries; and "Ian Maclaren" and "George Eliot" and "Mrs. Harris" and all other masqueraders should be compelled to unmask before they are admitted to the table of lexicographic immortality.

The more important words are in many cases provided with etymologic notes. These are often new or contain new forms, with fresh references. See, for example, *bank*, v., "of clouds, to gather in masses"; *bask*, dry, bitter. The notes err rather on the side of restraint, but they are generally sound. The editor, however, has deemed it wise not to break wholly with etymologic tradition. He permits some infelicities. *Banian*, "a flannel jacket," etc., is not exactly "fr. Port. *banian* (cp. Ar. *banyān*), a Hindoo trader." It is an English formation, by a confusion and detachment from *banian-coat* and *banian-shirt*, where the first element is indeed the Arabic Hindu term indicated. *Backerly* is not from "*backer*, adj, + *-ly*"; it is a reduction of *backwardly*. *Ban-beggar* is not from "*ban* (to proscribe) + *beggar*"; it is a sophistication of *bang-beggar*, which the dictionary exhibits at length. The singular entry, "*Bear 'em*, vbl. sb., wood from fencing carried off at the end of work-time," should begin "*Bearing* (*bearin'*, *bear 'em*)," etc.

The editor's scholarly caution appears conspicuously in the "List of words for the present kept back from the want of further information," which precedes the second part (p. 145). Some of these suspended words are certainly not lucid: "barmigoat," "bellaven," "blair-hawk," will seem new on this side of the water. But "*batch*, a bachelor (Sc.)," is not unfamiliar here. "*Belly-rive*, a great feast, a social gathering (Sc.)," seems to call for no "further information" than a reference. Some of the words tempt conjectural explanation. "*Biler*, the metal handle of a pail (Nrf.)," must go with *bail* in the same sense, entered in the dictionary itself, and well known in the United States. "*Bat and breed*, phr., the ground which a mower covers with one stroke of his scythe (w. Yks.)," suggests an original **batten-breed*, where *batten* would have one of the senses given in the dictionary for *bat*,

namely, "the long handle or staff of a scythe," and *breed* is 'breadth' (A. S. *brædu*). *Banters o' Boby's*, given in the list as a figurative phrase for "destruction, death (Lanc.)," is no doubt our old friend *Tantrabobus*. This is the devil in his character as a nursery Bugaboo. Halliwell has "*Tantarabobs*, the devil, Devon," and Jago, in his 'Glossary of the Cornish Dialect' (1882), gives "*Tantrabobus* or *Tantrum-bobus*," as "a term applied to a noisy, playful child. 'Oh, you tantrabobus!'" Another form of the name is *Tantrabogus*, from which, it has been suggested by an American writer, the word *bogus* has arisen (see the Oxford English Dictionary, under *bogus*). There is a long story about Tantrabobus. It belongs to the boggart and bugaboo lore; but we must close the vista.

The editor's prefatory note declares his intention to deal with American dialects. In many instances the English dialect use is supported or amplified by quotations from American sources. But it is evident that the editor has had little American dialect material to use. Indeed, there is little American dialect material in print. The publications professing to represent "American" use, the compilations of so-called "Americanisms," the wild rakings of alleged "American" slang or of political, commercial, or journalistic cant, are, with few exceptions, thoroughly untrustworthy. They are deficient in learning, wrong in method, indiscriminate in selection, and inaccurate in detail. The best-known of these productions, Bartlett's 'Dictionary of Americanisms,' though it has gone through several editions, is open to all these censures. Its representations of American dialect are often inaccurate or wholly wrong. It mixes up real dialect, real local use, real slang, with archaic uses, high literary use, universal English use, and stirs all these up with individual caprices, isolated instances of journalistic humor or vulgarity, and of manufactured "dialect" in now forgotten "humorous" works, into an unhappy chaos of still raw material. De Vere's work is respectable but gossipy. The productions put forth under the names of Farmer and Maitland, the former of which we see quoted with apparent confidence by British writers, including the editor of the Dialect Dictionary before us, are unspeakably crude and deserve no scholarly respect. They are to be regarded literally as raw material. An American scholar who should add to his own study and observation a judicious use of the real or nominal dialect material in Lowell, Mrs. Stowe, Mr. Howells, Mr. Harris, Mr. Harte, Mr. Cable, Miss Wilkins, Mrs. Stuart, could easily provide the world with a trustworthy record of American dialect even before the American Dialect Society shall have accumulated sufficient material, and gained sufficient support, for the projected American Dialect Dictionary. In the meantime, it is but right to warn British (and Scottish) lexicographers against the notion that there is any such thing in existence as a real dictionary of real Americanisms.

The editor concludes his prefatory note to Part II. by saying that "a complete list of subscribers will be printed when Volume I. is completed." We do a service to English scholarship and to English literature when we say that every public and every college library in the United States ought to subscribe for this great international work, and that every scholar who shall refrain from possessing it, or at least using it, will be debarred from the pleasure of holding defensible opinions on half the debated points of English philology.

AMERICAN COALS.

The Story of American Coals. By William Jasper Nicholls. Philadelphia: J. B. Lippincott Co. 1897.

To tell the whole story of American Coal, from its genesis in the carboniferous age to its consumption in our stoves and under our boilers, is a large undertaking; and as Mr. Nicholls's book is not bulky, its treatment is of necessity sketchy and imperfect. It is a compromise between a scientific treatise and a popular exposition. Its science is borrowed verbatim from the most incongruous sources, and it does not always fit without a hiatus into the historical and descriptive details. Even the political bearing of the subject is not omitted, for the author never loses an opportunity of emphasizing the necessity of a high tariff to exclude Nova Scotia coal, in order to compensate for the higher cost of our own product when the cheaply mined surface beds have been exhausted. With a dread of Nova Scotia seems to be associated in this author's mind an aversion and jealousy of England. But, despite its defects of method and of taste, the book is a very clear and on the whole correct compendium of information on a subject of great national importance.

The story of coal-mining, whether in this country or elsewhere, is more prolific, not only of interest, but of pathos, than that of any other of our mineral industries. While the occupation of the coal-miner is fraught with exceptional danger, his remuneration is lower than that paid for similar labor. According to our author, the miner in the bituminous pits of Pennsylvania breaks on an average four tons of coal a day, at 35 cents per ton. He therefore receives for his hazardous exertions, carried on often in a cramped posture and in a vitiated atmosphere, $1.40 per day. But as he works on an average only 165 days a year, he has to support his family on $231.00 per annum, or 65 cents per day. These figures are below those of the United States Census report of 1890, which allows to the Pennsylvania anthracite underground laborer an average of $201 for 181 days, or 99 cents per day; and to the underground bituminous-mine laborer $188 for 215 days, or $1.10 per day. In any case, it is a miserable pittance for the work done and large risk incurred; but so unlimited are the coal resources, so cheaply can certain mines be opened and worked, so keen is the competition, and so variable is the demand, that it is impossible for either employer or employee to combine effectually, and thus insure the workman a higher wage or the operators a better price.

The small area within which our precious anthracite resources are confined has enabled eight great railroad corporations to secure by purchase 95 per cent. of all the anthracite land of Pennsylvania, which means more than 90 per cent. of all the discovered anthracite of the United States. These railroad companies, by mutual agreement, regulate the output and the proportion to be mined and marketed by each. Nevertheless, owing to the extravagant price at which much, if not most, of these coal lands were secured, the companies do not make excessive profits on the mining and the carriage of their product; consequently labor in the anthracite regions is even more poorly remunerated than in the bituminous, for though the pay is higher, the employment is less constant. As anthracite is widely used for domestic purposes, a severe winter secures brisk demand and steady work; a mild winter involves the reverse.

Nature has been very lavish in her gift of coal to this country, bestowing on us not only quantity, but every variety and quality; and she has so distributed it that no large section is altogether deprived of mineral fuel. The only boon she has denied us is coal on or near the Atlantic seaboard. A long internal carriage alone handicaps our coal-mines as competitors for foreign trade. This advantage Nova Scotia possesses, by the existence of extensive coal-beds immediately on tidewater, both on the mainland and on the island of Cape Breton. But the advantage is counterbalanced by the inferior quality of the coal and by a higher cost of production than that of the coals of Pennsylvania, Maryland, and Virginia, with which it has to compete in our Atlantic seaports. The present duty is about sufficient to tilt the balance against Nova Scotia. Without it, her coal would compete on more than equal terms in the New England market with the product of our own mines, to the detriment of the coal interests of our Middle States, but to the corresponding advantage of our Northern manufacturers.

The dimensions of our coal-mining interest may be conceived of from the following figures. According to the census of 1890 there were employed at the mines, the country over, 268,619 hands, and as the production of coal has increased since then about 15 per cent., there must be to-day about 310,000 men and a few boys earning a scanty living from mining and preparing our coal for the market. Allowing that only four mouths are fed from the earnings of each laborer, we have 1,240,000 dependent upon coal-mining alone, or 1¾ per cent. of the total population. Almost as many more must be employed in the transportation of the coal and coke to the market. This large section of the population mined and handled, in 1895, 53,000,000 tons of anthracite (all from Pennsylvania with the exception of about 1,000,000 tons from Arkansas, Colorado, and New Mexico) and 135,000,000 tons of bituminous coal. The value of this great bulk of fuel at the mines was $197,769,043, or about two and a half times the market value of all the gold and silver produced in 1895 in the United States. The anthracite of Pennsylvania alone was sold at the mines for almost exactly the market value of our precious metals in 1895; yet the former never enters as a factor into national politics, while some would predicate the dependence of our very existence on the latter.

While the anthracite is the inheritance of Pennsylvania alone, bituminous coal is mined in all but fourteen States and Territories of the Union. Pennsylvania leads with fifty-two million tons, and Illinois, whose coal area is four times that of Pennsylvania, follows with eighteen million. But between these there is a difference, not only of quantity, but of quality. Vast as is the volume of coal in Illinois, Kansas, and other prairie States, and invaluable as it is locally, the quality (both of coal and of coke) is inferior to that of the product of the great Appalachian Basin, which therefore monopolizes the shipping trade even to interior points. The coal of the Cumberland region, Maryland, finds its way all over the continent for blacksmithing purposes, while the cokes of Connellsville, Pa., and West Virginia are shipped to Arizona and Montana, a distance of more than 2,000 miles, by railroad, though inferior cokes are manufactured with-

in as many hundreds of miles from the furnaces consuming them.

The wonderful growth of our coal industry within a little more than half a century is attributable to influences, some of which are both effect and cause. In 1840 we numbered only 17,000,000 of population, and then our forefathers heated their houses largely with wood. About a million tons of anthracite for all purposes were then mined. Our population now reaches 70,000,000, and if we estimate that only one ton of coal is used for domestic purposes per head of the population, our consumption for that item alone will reach some 70,000,000 tons. But this torrent of population would not, and could not, have flowed into and over the land had it not been for the railroad and the steamboat, which are directly the next largest consumers of our coal. Thirty million tons, at least, are burned annually in our locomotives, and half as much more must be consumed in our lake, river, and ocean steamboats, or about 25 per cent. of the whole. Metallurgists are probably the next largest consumers. In 1840 our forefathers made only some 300,000 tons of pig iron, and this was reduced from the ore in great measure by charcoal. To-day we make 9,500,000 tons of pig iron in furnaces of such size that one alone turns out in one month the whole output of the whole country in 1840. And we consume in these furnaces, of coal converted into coke and of coal under the boilers of our blowing engines and in our rolling-mills, about 20,000,000 tons, or 10 per cent. of the total; for the making of pig iron is only the first of the metallurgical processes that combine to yield us the iron and the steel which every year we are turning to new uses and manufacturing into new shapes.

Nor are iron and steel the only metals which our unlimited command of coal and coke as well as ore has enabled us to produce in quantity already in excess of any of our competitors in the industrial world. We make about two-thirds of the world's crude copper, and one-quarter of the world's production of lead; and when we fully appreciate the manufacturing advantages which our good fuel-supply confers on us, we shall manufacture into specialized compounds and forms all these and other metals, instead of exporting them as crude material to be manufactured abroad. What amount of coal is consumed in our great woollen and cotton mills and in the smaller workshops of the country, it is impossible to calculate; but without such consumption we could not have risen in so short a period into the first rank of the great manufacturing powers, nor kept the wheels of our immense internal and growing foreign commerce in motion.

As we are a country of great distances, this is especially true. If coal were not widely disseminated, and fuel for our locomotives had therefore to be hauled a thousand miles or more, our freight charges could not be, as they are to-day, the lowest in the world. And if coal were confined to a few, and these distant, regions, manufacturing could never have become, as it has, a common occupation of every section of the land, but the West would still be a grain-producer, the South a cotton-grower, and the metal and manufacturing interests would be confined to the Middle and North Atlantic States. As it is, thanks to the abundance of coal in Illinois, Chicago and other towns in that State are as conspicuous for their steel and other manufactures as Pennsylvania itself. The "New South," with its great coal resources in the Virginias, Tennessee, and Alabama, is to-day fixing for the older iron States the price of pig, and is converting into textile fabrics her cotton in her own factories. This interfusion of manufacturing and farming is effectually correcting the once ominous subdivision of the country into communities of opposing interests, and therefore of conflicting political prejudices. Even what was till recently the "far West" is entering the community of manufacturing States, owing to the possession of coal. Colorado has its iron furnaces and its steel-rail mill, and, by virtue of its cheap fuel, is certain to become ere long a manufacturing, and to cease being solely a mining and a ranching, State. When that stage is reached, its people will view and vote on the intricate economical questions which are to-day, and will continue to be, the burning topics of political discussion among us, more dispassionately and with juster regard to the conflicting interests of others than they do at present. Not only, therefore, do coal and prosperity go hand in hand, but coal and politics are close allies.

A consideration of moment is the probable duration of our coal-supply, but it is far less vital to ourselves than the same consideration is to England, for instance. Her coal is mined to a depth of 3,400 feet, and another century, at the rate of present production, will exhaust her coal to a depth that would to-day make its mining unprofitable. But it does not follow that during this next century improvements in methods and machinery will not compensate for and even more than counterbalance the greater cost of deeper mining. Our stores of the most accessible and of the most cheaply mined bituminous coal are being rapidly drained, and therefore the extremely low cost of sixty and seventy cents per ton at which Clearfield and some other Eastern coals are sold on the cars cannot be for ever maintained. But the date is incalculably distant when any one of our great basins of soft coal will be exhausted. The same, however, is not true of the deposits of anthracite. The three main basins, the Schuylkill, Lehigh, and Wyoming, cover an area of only 480 square miles, or less than one-hundredth of the area of our bituminous coal resources. And of these three basins, the Lehigh, which yields the best coal, is so much the smallest that its comparatively short life can be approximately measured. But two conservative causes are coming into play to arrest the rapid exhaustion of our valuable anthracite—more careful and economical mining, by which the excessive waste in extraction, amounting in the past to as high as 60 per cent. of the actual cubic contents of the coal, will be minimized, and, simultaneously, a great reduction in the consumption of coal required to create heat and generate power. The day is not far distant when, instead of thousands of wasteful stoves and open fireplaces in each of our cities, burning an extravagant amount of fuel for the heat actually generated, coal will be gasified, its by-product saved, and the gas conveyed, like illuminating gas, to every household, with an immense addition to human comfort and as immense a saving of fuel and labor. But a still greater economy will result in an improvement in engines and metallurgical methods. Our best boilers and steam-engines to-day generate only one-tenth as much power as the energy actually stored in the coal consumed represents; and the fuel we employ to reduce our ores and to refine and manufacture the metals is almost as wastefully burned in our furnaces. Already gas-engines are manufactured which do the work of the steam-engine of the ordinary type with one-quarter the fuel, and we are promised electricity direct from coal, which electricity can be converted into power with a still nearer approach to theoretical economy. There is no reason to suppose that our demand for power will abate. On the contrary, our love of ease and the scarcity of certain classes of labor will stimulate inventors to devise ever more complete appliances to replace physical exertion by machinery. Thus, though the demands for more power will continue to be imperative, the principal agent in generating it will be consumed so much more economically that its exhaustion will not proceed in proportion to the increased uses to which it will be turned.

MORE FICTION.

The Real Issue. By William Allen White. Chicago: Way & Williams. 1896.

Old Dorset: Chronicles of a New York Country Side. By Robert Cameron Rogers. G. P. Putnam's Sons. 1897.

Ring o' Rushes. By Shan F. Bullock. Stone & Kimball. 1896.

Arrested. By Esmè Stuart. Appletons. 1897.

On the Face of the Waters. By Florence Steel. Macmillan. 1897.

Lord Palmerston's contemptuous sniff at the man who "has been there" was never in more need of repetition than to-day, when syndicate writers rush to every cross-roads for local color, expecting to get it in twenty-four hours. Having been there, may they not speak? Accordingly they do speak, and from their shrill, confusing chorus we turn with relief to the words of the man who was born there. Mr. White has this right to speak for Kansas, and his fifteen short stories, dealing mainly with life there, have the accent of truth. In the "Story of Aqua Pura" and the "Story of the Highlands" this truthfulness becomes almost categorical, and one is compelled to the reflection that more art and fewer facts had carried greater conviction. For newspaper reports of actual disaster we have neither tears nor memory, though we lavish both on the unrealities of fiction. And if we remember the years of cruel drought in Kansas, it will not be for the careful accuracy which provided us with dates, but because of the four-year-old child who sat on the warped steps and asked, "What is rain, Mr. Barringer?"

The story chosen for the title-piece is rather a bare bit of realism, but the book discloses better things. In the "Reading of the Riddle" Mr. White displays much sympathetic insight, while the main incident—the midnight drive of a young man and maiden over the prairies—is in itself no bad commentary on a civilization where such things are so frequently and innocently done. In "The King of Boyville," freshness of observation and vigor of expression have produced an effective little picture which will appeal wherever schoolboy sentiment is shown by somersaults. Mr. White's touch is at times not unpoetical: "Heat-lightning winked devilishly in the distance, and the dissolving clouds . . . laughed in derisive thunder at the hopes of the worn old man"; this too nearly paraphrases Shelley's line not to be good. Less happy is the description of a night scene: "The large, sombre quiet, dotted by the tinkle of country cowbells." A praiseworthy desire for fresh combinations has led Mr. White to

'quaint some of his words with strange bedfellows. We read of a "shrivelled tear," of a scene "weirdly dry"—a phrase which may be called reversible, since, like a good rule, it works both ways—and we are told of a silence which "gnaws the glamour from the heart." The success of such forced alliances may be doubted, but Mr. White is seldom overlanguaged, and his direct style often attains to vividness.

If the arbiters of literary modes were as frank as those who dictate in the realm of dress, their latest utterance would be on this wise: Villages are much in vogue; the dialect decorations may be chosen to suit the taste of the writer. Old Dorset is not in the least like Thrums or Drumtochty, for it is in southern New York and the dialect is slightly modified New English. Moreover, in Scottish village annals we do not find the figure—traditional with us since Rip Van Winkle—of the village drunkard, who is always a good sportsman and beloved of children. He flourished in Old Dorset under the name of Ezra Spicer, and his "Expiation" makes the best of the Chronicles. The spirit of Old Dorset is said to be embodied in a certain chivalrous old Major with whose romance the Chronicles are chiefly concerned. The leisurely style of the book conveys harmoniously the author's conception of the placid village life of forty years ago.

The green, shamrock-sprinkled cover prepares one for the presence, in 'The Ring o' Rushes,' of that dialect which was formerly called brogue. The author is evidently more at home with this than in the use of English undefiled, for even when speaking in his own proper person he finds it difficult to rid himself of the poetic inversions, the lapses and licenses that characterize the Irish peasant speech. Strong as he is on his own ground, he has put into the mouth of one of his personages a speech like unto none that is uttered under heaven. His Magnificence returns to his native Gorteen from a sojourn in "Chicago City," where he has acquired wealth and, rather more inconsequently, a "Yankee drawl." A specimen will serve to show a London Irishman's conception of this:

"I reckon in Chicago City I've a fine house and plenty in it. My furniture and fixings I calc'late would work out to a pretty high figure. My pictures and statoos cost me I guess some hundreds of dollars. Two domestics I keep, yaas. . . . I've just come from a little holiday trip, you knaow. . . . My baggage I guess is coming from the station just naow."

The untravelled inhabitants of Gorteen and the vicinity bounded by the Ring o' Rushes are interesting and picturesque enough to make their acquaintance worth while. Among them poor Jane Fallon, whose bridegroom, bargaining for her dowry, broke her heart with his "Make it guineas and I'll take the heifer," stands out, a tragic little figure. The stories are preceded by a prologue, which should, however, be read last if the reader is to share the enthusiasm with which the author here marshals his various characters.

'Arrested' is a story of love, jealousy, pride, poverty, gold, treachery, murder, mystery, and other exciting passions and possessions. There is good English in the dialogue, and some humor in the shape of a notable landlady and her cowed husband, suggestive of a similar couple in 'Sketches by Boz.' If so many novels must be written every year, and among them so many of the old-fashioned kind, where, after many vicissitudes, "Truth prevails and virtue is triumphant," this one has better excuses for existing than many of its contemporaries.

Historical novelists of to-day, like historical novelists of the past, love to choose for the scenes they depict a period abounding in dramatic events and startling incidents which is already generally, if vaguely, known to the majority of their readers. In French history the times of the Fronde and of the French Revolution supply exactly what is needed; in English history, the period of the Great Civil War; and in American history, the era of the War of Independence. Quite modern history affords few more appropriate settings for an historical novel than the trials and struggles of the handful of Englishmen and Englishwomen upon whom fell the brunt of meeting the outburst of the mutiny of the Sepoy army in 1857. Men who lived through that troublous time generally decline to speak much of it, and with rare art Mr. Rudyard Kipling, in one of the finest of his short stories, "On the City Wall," represents a young English subaltern refusing to speak of the Mutiny with the dignified native prisoner whom he has in charge. Mr. Kipling, indeed, had carefully abstained from making more than one or two chance allusions to the events of 1857 throughout the numerous volumes of his tales of Indian life. Others have not imitated his reticence. Mrs. Steel, the author of some graceful studies of Indian native life and of some agreeable novels of Anglo-Indian society, has essayed a higher flight in her latest work, 'On the Face of the Waters,' and has deliberately selected as the theme of an elaborate novel the Indian Mutiny with its culmination in the siege of Delhi. It is impossible to avoid comparing Mrs. Steel's book with other Mutiny novels. Perhaps the best of these is the late Sir George Chesney's 'The Dilemma,' which contains a vivid and accurate account of the famous defence of the judge's house at Arrah by a handful of Englishmen against more than ten thousand natives supplied with artillery; and among others may be noted Colonel Meadows-Taylor's 'Seeta,' and Mr. Forrest's 'Eight Days.'

Mrs. Steel's book is inferior to Col. Chesney's in that she cannot reproduce, as he did, from actual experience, the atmosphere of the days of the Mutiny, but as a mere story her plot is better conceived and her characters more natural and true to life. She has carefully studied the records of the Mutiny and thus acquired a knowledge of its facts, but her very labor gives an air of artificiality to her account of events which contrasts with the simple eloquence of actual observers in contemporary letters and journals and in official reports. This is not the place to criticise her history, though it may be pointed out that she is a little hard upon the gallant leader of the Third Bengal Cavalry, Col. Carmichael-Smyth, and that her account of Mrs. Leeson (or Mrs. Collins as she is called by some authorities), the white—or, rather, half-caste—woman who escaped from Delhi during the siege, is not perfectly accurate. Still more doubtful is her explanation of the causes of the famous outbreak, although in this matter she has been mainly guided by Mr. Forrest's volume of official records. The one historical character whom she brings prominently upon the scene is the heroic John Nicholson, who is indeed a figure more fit for the pages of romance than those of sober history. As a story, 'On the Face of the Waters' shows great constructive skill and brilliant characterization, and places the author quite in the forefront of contemporary Anglo-Indian novelists.

A LIGHT OF UNIVERSALISM.

Life of Alonzo Ames Miner, S.T.D., LL.D. By George H. Emerson, D.D. Boston: Universalist Publishing House. 1896.

If the contents of this volume were equal to its admirable appearance, it would be a better monument to Dr. Miner than he could have in brass or marble. But the biography published so sumptuously and attractively has some serious defects. The least of these are the dubious constructions, here and there suggesting hasty composition or revision, and the lapse of a style habitually florid into metaphors which are sometimes badly mixed. More serious are such vulgarisms as the changes rung on Dr. Miner's name, the full-mouthed "Alonzo Ames Miner" being reserved for passages of elaborate commendation, and for those scenic effects for which Dr. Emerson's predilection is unmistakable. It is this which has proved more injurious to his book than anything else, except possibly the diffuseness natural to one whose daily business is the editing of a denominational paper. But the book might have been more diffuse than it is, and, if Dr. Emerson's eye for the essential had been as sharp as it is for the spectacular, he would have given us a much clearer impression of Dr. Miner's character and the sources of his varied power. Even then we should have had a eulogy, for evidently the idea that a good biographer is something better than a eulogist has never entered Dr. Emerson's head.

Among Universalists Dr. Miner was a leader of the greatest prominence. In the history of their denomination he will always have a place with Murray and Ballou and Whittemore and Chapin; and it will not be the lowest on the list. His time and his abilities assigned to him a different work from theirs. He was much more intellectual than Murray, and he worked his Universalism very differently; Murray's being merely the crudest possible variety of Calvinistic Methodism. As compared with Ballou, Dr. Miner was much less innovating and original; as compared with Whittemore, much more dignified and refined, if much less popular. Drs. Miner and Chapin were born in the same year, and they were for a time rivals in the esteem of Massachusetts Universalists; Dr. Chapin being much the more attractive preacher. When Dr. Chapin came to New York, he made easier Dr. Miner's advancement to the highest place in Boston, but there was room for both of them in the same field, their methods were so unlike. Dr. Chapin was indifferent to denominational organization and doctrinal preaching. He was no controversialist; Dr. Miner nothing if not one, and an inventor and manager of denominational machinery. It is not among Universalists, but among Unitarians, that Dr. Miner finds the leader with purposes and enthusiasms most like his own, Dr. H. W. Bellows, whose life, strangely enough, has never yet been written. The resemblances and differences of these two men would afford a very interesting subject for comparison. For denominational organization and education they had an equal passion. But Dr. Bellows's extra-denominational activity was much healthier than Dr. Miner's, and personally he was much more a man of the world. While strictly temperate, he had little inclination towards Dr. Miner's prohibition politics, or his dictum that the use of wines and liquors is inseparable from their abuse.

Dr. Miner was born in Lempster, N. H., August 17, 1814, and died in Boston June 14,

1895. "Certain particulars" are given "connecting him with the royal family of England," but not by blood: Edward III. gave the name Miner and a coat of arms to a miner who fitted out for him a company of one hundred fighting men. Much that is interesting is related concerning Dr. Miner's ancestry and parentage. The son's strenuous Universalism was an inheritance from the father. A long illness, consequent on a fall from an unruly colt, selected him for the work of the ministry. His only preparation for it was that afforded by such minor academies as those of Franklin and Lebanon, and by his preaching whenever he had opportunity. Ordained in 1839, his first pastorate was in Methuen, Mass., and lasted for three years, when he went to Lowell. Dr. Emerson writes elaborately on the factional Universalism of the time, but fails to indicate which side the young preacher took in the denominational division. An instructive passage is that pertaining to the endeavor of the orthodox Congregationalists to make the Washingtonian temperance reformers subject to their will. Dr. Miner won his spurs in a tilt disputing the rights of this matter. What he said is not set down — hardly could we expect it to be; but it is Dr. Emerson's habit to omit what is most important — the words producing certain memorable effects.

Next to Dr. Miner's interest in temperance, we are told, was his interest in anti-slavery, and we are promised that "in a chapter by itself justice will be done to Dr. Miner's anti-slavery record." But when the chapter comes, it has little more to tell than that Dr. Miner delivered the Boston Fourth of July oration in 1855 and took strong ground against the enforcement of the Fugitive Slave Law. History is somewhat dislocated when the passage of this law is made subsequent to the repeal of the Missouri Compromise, which in fact was later by four years. In Lowell Dr. Miner did much to make himself *persona grata* with the orthodox churches by stoutly defending them against the abolitionists. In this instance his words are given, and it is amusing that Dr. Emerson should think the abolitionists "logically silenced, their only gun spiked." His argument was, if the fornicating Corinthian Church was a church of Christ, why not the slaveholding American? But the abolitionists would have denied without a moment's hesitation that the fornicating Corinthians were Christians.

There is nothing in Dr. Emerson's book more pathetic than the fortunes of Father Ballou's church in Boston. In 1845 the society was so weak that there was a proposition to wind up its affairs and sell the church building over the aged pastor's head. Dr. Chapin came and brought with him a temporary prosperity; he went off to New York, and the situation became more critical than ever. Dr. Miner was summoned to the rescue, and he came, and his pastorate extended from 1848 till 1892. It was successful to a remarkable degree and in many different ways. It filled the last years of Father Ballou's life with happiness. It made the church a centre of denominational activity. The society, instigated by Dr. Miner, raised more than half a million dollars for Tufts College, of which he became President in 1862, holding the office and his parochial charge together until 1874, for some years without an assistant pastor, for some without a salary from the college. His own gifts to the college were most generous, amounting to nearly $50,000. His interest in denominational education was not by any means exhausted by his relations with Tufts. There he was not only President but preacher, and teacher of ethics and political economy. The best glimpses of his teaching are in the appendix, where they are furnished by the Rev. J. C. Adams.

It is astonishing that in an octavo of 550 pages Dr. Emerson furnishes so little evidence of Dr. Miner's intellectual force. There is scanty indication that he had any of the kind which expresses itself in pure thought. What he had was logical acumen, skill in argument, great executive ability, and a commanding personality. In one of his rhetorical flights, Dr. Emerson thinks he might have been a Cromwell in Cromwell's time, a Luther in his century. But he would have been a Cromwell with a difference: he would have hung John Biddle and George Fox, both of whom Cromwell treated kindly. Luther he was most unlike, and he was much like Calvin. No Calvinist of his generation had more the Puritan temper than he. We fail to find in him, as depicted here, any poetry or humor. Little is said of his relation to the great scientific and critical problems of his times, but enough to show that with the new ideas he had no sympathy and for their promulgators no admiration. His theology moved in the old textual circle from which the new Universalism now in all the churches has drawn nothing of its strength.

His Puritan temper found expression in his persistent anti-Romanism and intemperate temperance propaganda. In his anti-Romanism he was a forerunner of the A. P. A., and should have been its acknowledged head. Dr. Emerson's chapters on temperance reform and prohibitory legislation are most unsatisfactory. Apparently he has not learned that evolution may be degeneration. Papal infallibility should have taught him this *ad hominem*. But he exhibits the evolution of both total abstinence and prohibitory legislation as if their evolution were their justification. When we consider that Dr. Miner was better known in Massachusetts as the protagonist of State prohibition than as a Universalist preacher or educator, it is pitiful to find Dr. Emerson's account of him in this aspect of his life narrowed down to a few pages, and these for the most part taken up with a rhetorical picture of the scene in 1867 when he and John A. Andrew argued the case of prohibition before a committee of the Massachusetts House of Representatives. Here, again, while we are told that "he rose to the height of the great occasion with Websterian grandeur," no particulars are vouchsafed, nor do we get the substance of his argument. We are assured that Andrew was completely floored, but some who remember the affair will not so judge it, and they will recall Dr. Miner's extremely characteristic attempt to prove that the wine which Jesus made at Cana was unfermented, and his insistence that if the contrary were true, the last excuse for temperance would be destroyed. The Temperance Alliance expressed its full satisfaction "by the presentation of a costly copy of the Doré Bible."

It is evident that Dr. Miner had great ability as a denominational and educational organizer, and that the Universalist body owes him much for what he did in this two-fold capacity, and also as the pastor of a large and generous congregation. It is further evident that among the thinkers of his time he has no place, that he wrote nothing which has permanent value, and that his influence upon the thought of the Universalist body was distinctly unfavorable to its rational development. That he had personal qualities more engaging than were suspected by those who knew him only in the stress of his forensics on the public stage, is a persuasion that cannot be escaped by any careful reader of Dr. Emerson's valuable and yet disappointing book.

In and Beyond the Himálayas: A Record of Sport and Travel in the Abode of Snow. By S J. Stone. Illustrated by Charles Whymper. New York: Edward Arnold. 1896.

Mr. Stone has by good shooting killed so many large animals that we should forgive him if he began his narrative of sport with the words "arma virumque cano." He has made seven long expeditions to Kashmir and Tibet, in the course of which all the most highly prized varieties of game known to the hill country have been swept within his bag. Whoever is curious about the manner of stalking and "bowling over" and even "haláling" the "blue ribbons" of the Himalayas, will find what he wants to know here, unless his imagination soars beyond márkhor, ibex, bear, nyan, wild yak, and stag. Mr. Stone writes with directness and modesty of lands which are but partially explored, and is consumed by a love of adventure which will go straight to the heart of every hunter.

Mr. Stone does not detain his reader by the oft-rehearsed account of the way from Baramúla to Srinagar, but hurries him at once to the scene of action. He breaks up his experiences into three parts, making Astór and Ladakh, respectively, the centre of the first two, and in the third reaching Tibet by means of the Baspa Valley and the Gúgérang Pass. The last section contains the most interesting chapter of the book, Mr. Stone's intercourse with the Panbóh of Zárang. The Tibetan border is supposed to be hermetically sealed to travellers from India, and this particular Panbóh was very nasty until "her Majesty's silver countenance" had been exposed to view. The description of his gradual thawing out, eventual friendliness, and the Anglo-Tibetan feast which followed is delightful in itself, besides breaking the monotony of game-slaying. The climax of the entertainment was reached when Mr. Stone produced his flask and proceeded to distribute its contents among the uncouth native guests:

"After tea and biscuit, the Panbóh showed his satisfaction by holding up his thumb and saying I was a jolly good fellow. This is the Tibetan mode of returning thanks. Each one held up his thumb in the same way, with the fist closed, and repeated the same words. Now the whiskey came round. It had to be explained first to the Panbóh that it was the same as his chhang, made from barley. He took a few drops in the palm of his hand and tasted it. Approval stole over his face; and a few drops went round in the usual way in the palm of each man's hand. Smacking of lips, wry faces, and grunts of satisfaction resulted. It was evidently too strong neat, and water was called for. Then a little whiskey and water round in the cups again, with universal approval. This, I will make bold to say, was the first time that 'Napier Johnstone' was drunk by highlanders of this ilk; but the smacks, eye-twinklings, and coughs bore strong resemblance to the symptoms noticeable under similar circumstances in the far-off land of the grateful liquor's birth. As a special honor, I mixed a glassful in my own silver travelling-cup, and handed it to the Panbóh for his particular delectation; but the same thing happened—he took a sip and passed my silver cup round to each man as before! It was drained when it came back to the Panbóh, who politely handed it over his shoulder to my servant, and told him to have it cleaned. The spirits warmed their hearts, and I had again the emphatic verdict of their thumbs."

While Mr. Stone managed on the expedition just mentioned to explore a corner of Tibet which had never before been touched by a European, his success in shooting was indifferent. His best big-game record (and this is a big-game rather than a geographical volume) was made in the Keipsang valley above Leh, where he killed three bull yaks in six days. The head of the largest weighed 100 pounds and had massive horns 34 inches in length. Yak-shooting ordinarily involves day after day of stalking at the trying height of 17,000–20,000 feet. "The hunting and stalking are the most exciting in the world; the climbing, the ground and its surroundings the most trying. The chase of the wild dong, therefore, must be classed among the severest tests of a sportsman's quality." We doubt very much, though, whether the perils of yak-shooting equal those incident to the pursuit of the musk-ox in the Barren Lands. If respiration is more difficult, the food-supply is less precarious.

The district of Astór is celebrated for its position on the route to Gilgit, and for its claim to the superb peak of Nanga Parbat, which is among the noblest even of Himalayan mountains. Its valleys abound, or did before Astór became so accessible, in márkhor (*capra megaceros*) and ibex (*capra sibirica*). These animals range in the same regions, but at different altitudes. Their proximity is convenient, for when the sportsman fails to start márkhor on the lower levels, he can mount higher for ibex. The márkhor furnishes Mr. Stone with his chief subject, and stands forth with great dignity in the frontispiece. The nyan (*ovis ammon*) is a close second in its claim on general interest; less sought, perhaps, than the *ovis poli* of the Pamirs, yet so shy that Gen. Kinloch gives it the palm for wariness. "After a lengthened experience, I can unhesitatingly affirm that there is no animal so difficult to stalk as a male nyan." Mr. Stone seems to have found it less elusive than most hunters, killing four in one small district.

The writer's tender-heartedness and frequent compunctions are somewhat out of place in the autobiography of a Nimrod. If a man goes shooting, why should he lament over the fate of his victims? It would be far more logical to let the beasts of the field live. Over a brown bear Mr. Stone moralizes as follows: "An old male mortally wounded and fast dying at your feet, uttering his protest in his own bearish language, seems to say, 'Why have you murdered a harmless creature like me? I keep far away from the human species, and have done them no harm—even the roots and berries that are my food cannot ever be of any use to you and yours.'" And a little later, apropos of the yak he spared: "I have a horror of big bags—an unconquerable disgust at my own butcherliness comes over me when I stand over a noble animal that has been slain by my own hand; this feeling increases with every fresh trophy added to my collection, till it forces me to drop the pursuit of that particular game and follow something else." Truly, the quality of mercy is not strained!

Mr. Stone shows by numerous illustrations the strength of shikári insistence upon the halál or throat-cutting of a wounded animal. In strictness the act should be performed before the victim breathes its last, but, to effect an economy of meat, a subterfuge has been devised by some of the less devout. If the hunter follows up his game without rest, he may halál it when found, even though it be stark dead. If once he sits down, the meat is unlawful and is allowed to rot. A Moslem exact in the performance of his religious duties, like Mr. Stone's shikári, Sharafa, considers the easier form of halál to be irregular and profane.

The devotee of big-game shooting will find it well worth his while to read the story of Mr. Stone's adventures.

The Tale of Thrond of Gate, Commonly Called Færeyinga Saga. Englished by F. York Powell, Regius Professor of Modern History in the University of Oxford, etc., etc. London: David Nutt. 1896.

The Færeyinga Saga was given the name it usually bears by C. C. Rafn, who first published it in 1832, with the Icelandic text and a Færoese and Danish translation. The saga owes to Rafn not only its publication, but its actual identity as a separate work. It is found, namely, in that most comprehensive of Icelandic MSS., the great *Flateybook*, which contains lives of the Norse kings, not as a continuous narrative, but as separate parts imbedded at intervals in the text of which it thus forms a constituent part. Internal evidence shows that it apparently came into the hands of the compilers of the *Flateybook* as a single saga, and by them was dismembered to suit their particular purpose. The new form is, consequently, but a rehabilitation. As a saga, it has the characteristics of the other Icelandic sagas of the classic period, for it plainly arose in Iceland and not in the Færoes. From internal evidence, again, its date as a whole is the early part of the thirteenth century. The text here used follows throughout the Rafn edition. Here, as there, the translator substitutes, in chapter xxvii., a passage from the Olaf Tryggvason Saga for the more elaborate account of the *Flateybook*, in that, to quote him, "it seems (as C. Ch. Rafn thought) to suit the saga better." There are versions of the saga in Danish and German, but this is the first rendition into English.

The Færeyinga Saga, like many of its kind, although set forth as historical fact, is not always genuine history. Some of the apocryphal material in it is not always readily separable from the rest. Other parts of it, however, are but new versions of old tales elsewhere told, and a part of the ancient story-tellers' common stock in trade. Not a few memories of the persons and episodes of the saga are preserved to this day in the ballads of the Færoes, which are still sung and danced to in the islands.

Prof. Powell calls the saga the 'Tale of Thrond' from its principal hero, Thrond of Gata. Its central theme of action is the introduction of Christianity into the Færoes, in 998, in which Thrond and Sigmund Brestisson play the principal parts, the one bitterly opposing it with all his heathen wiles, and the other triumphantly furthering it, though he meets at the end with a pitiful death. The whole story is cleverly and dramatically told. Its two main characters in particular are admirably drawn. Sigmund is plainly the ideal of the saga-teller, who has given us in him a perfect type of the Christian of his own day. The author in his introduction directs attention to "his fidelity, his unselfishness, his mercy, and his marvellous prowess," which is second only to that of Olaf Tryggvason himself, the paragon of the North. Thrond, on the contrary, is made, as Vigfusson pointed out, a Louis XI. However bad he is, he has nevertheless throughout, in his stubborn opposition to the New Faith and its consequences, and in spite of his craft and cruelty, an unfailing share of the reader's sympathy. There is nowhere in the sagas a better piece of character-drawing than this of Thrond's, nor one more skilfully handled for its dramatic effect in the telling of the story.

Prof. Powell is not only the best-known pupil of Vigfusson, from whom he has both his knowledge of Icelandic and his essential points of view in matters Northern, but, since his preceptor's death, is far and away the principal Icelandic scholar in England. His translation is as a matter of course correctly and carefully done, and yet it suffers in more ways than one from faults, or rather blemishes, of rendition, which it seems as if a more critical apprehension of fitness might have obviated. The version, in the first place, is not merely translated, as the process is usually sufficiently well described, but, according to the title-page and elsewhere, is "Englished," a word which need leave no doubt as to the identity of the new medium. This is, however, in spite of the warning, an English that is frequently in need of a footnote. The issue of these important sagas in the sumptuous manner that has of late been in vogue is not an unimportant matter, and it does seem as if this phase of it might be better met.

The problem is not an insoluble one. The given factors are a Germanic language of the thirteenth century, in which there are many words and idioms identical with ours, to render as closely as may be into English—and not what may or might be English—neither too archaic to be unintelligible, either in whole or in part, nor too modern to take away the essential savor of the past which should cling to it like a garment. What Magnusson and Morris, and now Prof. Powell, really do, however, is to solve the problem only partly. Their works are caviare to the general, one and all; and the general public, more's the pity, neither heeds them nor reads them. From early English history we understand such words as *fyrd* and *grith*. *Withershins*, as in the phrase, "He went round the houses *withershins*," is, however, to many an incomprehensible word, and when we meet with *slot*, in "as if he were tracking their slot like a hound," we must look it up or lose it. What Sigmund and the rest really came to when, as the text says, "they came where a *ride* lay before them," only a recourse to the original Icelandic reveals. These are random instances, but they sufficiently illustrate the point. When Sigmund is made to say, "I would fain go a-warring," we think it rather puerile, but it is at least intelligible. Some of the diction is lucid, picturesque, and consistent, all three together; and there's the rub, for the whole of it might be so.

Then there is the matter of the rendition of proper names, whether of persons or places, with which fault may justly be found. Why, for instance, should Olaf Tryggvason, who is perfectly recognizable under his real name, be given an alias like "Olave Tryggwesson," as he appears here, or Nidaros be juggled into "Nithoyce"? Some of the names are translated and some are not, but there is no discoverable principle. Snæulf does not appear as "Snow-wolf," but the euphonious Gata is turned into "Gate"; Raumsdal appears as "Reamsdale," Hrafn Holmgardsfari turns up as "Raven Holmgarthfarer," and Thorbjörn Götuskegg as "Thorbeorn Gatebeard," as if these were an improvement upon the original forms. In the case of the well known names like the Harolds—Fairhair, Bluetooth, or Grayfell—where custom has sanctioned the usage,

or even the viking (Prof. Powell calls him a "Wicking") Harold Ironpate, who part of the time is Harold Ironhead, there can be no reasonable objection to the translation of the descriptive part of the name. The matter is, however, a delicate one, and nothing is gained by making out of good Norse appellations fantastic English ones. This part of the work is full of idiosyncrasies, and they are, furthermore, the idiosyncrasies that abound in Vigfusson's pages. It may be that Prof. Powell was the offending person all the time, since he has been associated with Vigfusson in notable works like the 'Corpus Poeticum Boreale,' where this very feature has ineffably marred the text.

All these points aside, Prof. Powell has given us access in his *Færeyinga Saga* to one of the most intrinsically interesting of all the sagas as literature, and one not without value for its many side-lights on the history of culture. It is a somewhat new direction for a Regius Professor of Modern History at Oxford to take, but it is one that may be readily followed still further with interest and profit.

Pickle the Spy; or, The Incognito of Prince Charles. By Andrew Lang. Longmans, Green & Co. 1897.

THIS very handsome volume, in which Mr. Lang exhibits his usual literary craft and more than his usual research, is a remarkable monument of a still more remarkable cult. The career of Charles Edward Stewart, "Prince Charlie," the Young Chevalier or the Young Pretender, is certainly full of adventure and vicissitude bordering on the marvellous; but surely the greatest marvel about it is the nature of the interest which it continues to excite to this day in Scotland. It is really difficult for any one who looks at Charles's history coolly and compares it with that of other adventurers—his own ancestors, James I. of Scotland, or Edward IV. of England, or even his great-uncle Charles II.—to comprehend the touching loyalty to his person, the pitying regret at his proved defects, which still attend his name. When Fergus McIvor brings Waverley into his presence, it can hardly be supposed that Scott has omitted any historic trait which might justify his hero in leaving the presence chamber with the enthusiastic burst, "A prince to live and die under." Yet if one reads over exactly what the Chevalier is made to say which wins Waverley to his cause, it is surprising how little there is in it all—less, even, than sufficed, about the same time, to bring Scott himself, who had hated the Prince of Wales as a Whig, to his knees in adoration of the Tory Regent; and, indeed, Scott makes his own Colonel Talbot comment on the emptiness of it all. Nevertheless, out of just such gracious phrases, and a refusal to authorize the assassination of the Duke of Cumberland, Mr. Lang endeavors to reinstate the old champion of the White Rose; and, when forced to admit, with the utmost unwillingness, the ingratitude, the meanness, the debauchery of Charles's later years, works up a theory of a gradual change of character produced by misfortunes. A little trouble, however, in recalling the Stewart history would show in almost every one of the line who survived middle age an equally disappointing development. James I. of Scotland, James I. of England, his son Charles, his two grandsons, all showed in later life traits wholly unsuspected by those who knew them as princes.

In the life of the young Pretender, as ordinarily written, there is a gap from his failure in 1746 to his father's death in 1766. He was known to be wandering about the Continent and visited England at least once if not oftener; but the diplomatic agents at the various courts were much mystified as to his whereabouts. Mr. Lang, from careful research in the Stewart papers at Windsor, and other sources, has succeeded in identifying most of his retreats, and especially in fixing him for several years in an apartment adjoining a convent in Paris, whence he was constantly intriguing with male and female conspirators while supposed to be in Berlin or Poland. The story is sufficiently perplexed and romantic; but it is marvellous to note the glamour that makes Mr. Lang dwell on every detail with a devout care which no other adventurer's career ever would elicit.

In the state papers are frequent proofs that Charles Edward was tracked constantly by a spy in the pay of England, who writes to the Pelham Government under various signatures, but especially as "Pickle," one of several proofs of the popularity of Smollett. The reports of this precious character have been for some time before the public, and a recent work has identified him with James Mohr Macgregor, mentioned in 'Rob Roy' as the youngest son of that redoubted chieftain, and portrayed at length by Stevenson as the father of "Catriona." James was a cheap traitor enough, and his identification as "Pickle" was not resented at the time by any child of Clan Alpine. But Mr. Lang's researches acquit him of this disgrace, and transfer it almost beyond question to another Highlander, Alastair Ruadh Macdonell, the "Young Glengarry," and himself the holder of that illustrious name in later years. And here it is that the cold Saxon is fairly puzzled at the deep agony which evidently rends our author's heart to think that a Highland chief—a Glengarry, a claimant for the headship of Clan Conuil and the Lordship of the Isles—could have taken the pay of the Duke of Newcastle to spy on Tearlach Righ Albainn. It is to him as it would be to a South Carolinian if Jack the Painter were identified with a Middleton or a Pinckney. And yet, are Highland chiefs of such elevation of character that they may not be even as Churchill or as Arnold? For a hundred and fifty years the world has borne very complacently the fact that Simon Lord Lovat, "Macshimei," the head of Clan Fraser, was true to no king and to no religion. Must every man, Celt or Teuton, who loves to read 'Waverley,' break down under the burden of discovering that the grand-uncle of Fergus McIvor's prototype was a spy upon an adventurer whom calm history must pronounce not much loftier than himself?

The book, as said above, is very elegant in dress and full of faithful research and spirited writing. But an American cannot help feeling that the expenditure of so much money and intellect on such heroes is better suited to those who consecrate memorial portraits to King Charles the Martyr than to a man of the genius and character of Mr. Andrew Lang.

Europe in the Middle Age. By Oliver J. Thatcher, Ph.D., and Ferdinand Schwill, Ph.D. Charles Scribner's Sons. 1896.

DRS. THATCHER and Schwill, teachers of history in the University of Chicago, have added another to the list of books on the Middle Ages intended for the use of college students. The authors attempt in their preface to justify their choice of a definition for the much-abused term "Middle Ages"—or "Middle Age." "This term," they say, "is necessarily vague," and "therefore" there was no reason why they should not employ it in its traditional sense as including roughly the period from 500 to 1500. This, we believe, is the fundamental error of a very well-meant work. To treat the history of Europe during any thousand years, but more especially in this particular thousand, in 650 pages, is not the kind of service now demanded by the conditions of our historical education in America. The excuse that this is the sort of book found to be needed for the practical work of the authors in their teaching at the University of Chicago, is not so much a justification of the book as a condemnation of their teaching methods. It appears to us that, if the "Middle Age" is a vague term, the first duty of the teacher and writer is to give it some precision by limiting it to a period which shall have a distinct character of its own, and then to bring out this character by every possible illustration. The period from 500 to 1500 is not merely too long for comprehensive treatment, but is too widely varied in its character. It includes two great epochs of social and political transformation, and, by fixing the attention on these more dramatic movements, the writer is almost certain to confuse the very impression he ought most carefully to preserve, that of mediævalness. At all events, be the theory of this book right or wrong, the execution leaves very much to be desired, and we are prepared to excuse many of its shortcomings on the ground of an impossible theory to start with.

In a volume of this compass, the division of space is a matter of the first importance; but here we have fifteen pages on the Feudal System and eighteen on Monasticism, while a full hundred, nearly one-sixth of the whole book, are devoted to Mohammed, Mohammedanism, and the Crusades. The necessity of saying something about everything, from German heathenism to the sculptures of Michelangelo, explains, perhaps, a sententiousness of style which has at times almost the effect of a catalogue of ships. Short sentences are, indeed, a good thing, but here they become wearisome and quite destructive of the sense of continuity or development. The same effect of scrappiness is produced by the division into paragraphs. These, too, follow each other, often without any evident reason, so that we can hardly fancy a student reading a chapter with much interest or getting any very distinct impression from it. The choice of language is at times such as makes one question the authors' familiarity with good spoken English.

There are several well-selected chronological tables, a good index, a list of emperors and popes, and some fairly good maps. We miss, however, all but the briefest references to literature. The authors explain this omission by "taking for granted that the teachers who may use the book are acquainted with the best literature on the period." Now, while it is true that the making of bibliographies is the most laborious and most thankless part of an author's work, since a bibliography is no sooner made than it is antiquated, it is also true that no work is more helpful to the teachers, for whom, quite as much as for the students, a text-book must be written. The assumption of our authors—would that it were not so—is not justified by the existing condition of our historical instruction in this country. In short, we have here, under a rather modern form, only another of the old-fashioned gene-

ral text-books of history. Our need is for careful and luminous treatments of shorter and strongly marked periods.

A History of Banking in all the Leading Nations. Vols. III. and IV. New York: *The Journal of Commerce and Commercial Bulletin.* 1896.

THE third volume of this great work is devoted to the history of banking in the Latin nations, and to that of banking in Canada. The fourth and concluding volume contains accounts of banking in Germany and Austria-Hungary, in the Netherlands, in the Scandinavian countries, and in Japan and China. We shall glance hastily over these elaborate treatises, not attempting to characterize them, but merely to indicate the methods that have been pursued by the authors.

M. Pierre Des Essars of the Bank of France has contributed the history of banking in the Latin nations, beginning naturally, if not chronologically, with French banking. We can with difficulty restrain ourselves from speaking with the most enthusiastic admiration of the manner in which he has discharged this part of his task. Necessarily, he has had to summarize the history of French finance; but, while he has sufficiently explained this complicated subject, he has presented a clear view of the constitution and operation of the Bank of France, and of the other great financial establishments of that country. We need hardly say that the Bank of France has from the beginning met with trouble from the interference of the Government, but, in spite of the fact that its governors are appointed by the state, it has managed to conduct its own affairs with such wisdom as to have always retained public confidence even when forced into insolvency. Its most terrible experience was in 1870 71, when Gambetta's Government was restrained from completely gutting the bank only by the warning that if it was ruined no other resource would remain. In spite of the most determined resistance, the Bank had to grant these men 475,000,000 francs. By means of vigor, diplomacy, and good luck it was able to purchase exemption from plunder under the Commune at the price of only 17,000,000 francs.

We need not say that the socialistic element, now rising into such prominence in France, looks with evil eye on this great institution, whose charter is even now expiring. But as the profit on its note circulation, which is of course the grievance of the Socialists, amounts to only about half a million dollars, while its connection with the Government is the cause of numberless vexations, M. Des Essars contemplates the future with composure. "Even in the event that a state bank should take its place," he remarks, "it will remain none the less the oldest credit establishment in France, and will continue, with its deposits and its checks, the work that it has known so well how to perform with its currency during nearly a century, to the great advantage of the country."

No nation learns from the experience of another; yet it is impossible not to wish that some of our well-meaning Populists might read what M. Des Essars has to say of attempts to benefit the farming class by creating institutions for their use. The Crédit Foncier, which was founded for the purpose of curing the "mortgage-leprosy"—a figure of speech deserving the attention of our agitators—has had the effect of drawing capital from the rural districts, and employing it in the improvement of cities. Hence the country population has flocked to the towns, and "the Crédit Foncier has thus contributed, more than any other responsible agency, to the growth of the city proletariat, which affords the most favorable soil for the seeds of Socialism." As the Crédit Foncier did not help the peasants, the Crédit Agricole was instituted, which, as the peasants did not utilize its funds, employed them in speculating in Egyptian securities, and eventually had to go into liquidation. The fact is that the law, having mercifully undertaken to shield the farmer against the exactions of his creditors, has made it impossible for him to borrow upon easy terms. Those who take the risk of lending their money to him make him pay for the risk, and the rural population complains bitterly of the usury which measures intended for their protection have occasioned.

We cannot speak highly of M. Des Essars's treatment of banking in Italy. The subject is one of great antiquarian interest, owing to the early development of financial institutions in the Italian republics. But its present interest is wholly pathological; the system of banking is thoroughly rotten, and, if it does not presently collapse from its own weakness, it will certainly be overthrown by the first war. No hopeful symptoms are to be seen, and the least scrutiny of optimistic claims shows that they have no substantial foundation. As to Spain, Portugal, and Greece, we can spare no time to examine their systems, and merely quote M. Des Essars's remark, that the profits made by the great banks of these countries prove the bad condition of their finances. "A bank whose credit depends absolutely on the State, and which stands responsible while it cannot offer opposition to the Government's prodigality and bad management, has all the drawbacks of a state bank, with hypocrisy added."

We have lingered too long in M. Des Essars's agreeable company, and must forego our intention to refer to certain instructive episodes in the history of the monetary union of the Latin nations as chronicled by him, which show that international bimetallism may not be free from chicanery. Passing on to other subjects, we must limit ourselves to saying of Mr. Walker's account of banking in Canada that it will doubtless be of present service in the regulation of our own currency, and that, strange as it may seem, the progress of Japan toward a sound and permanent system, to judge from the particulars furnished by Mr. Juichi Soyeda of the Imperial Ministry of Finance, is likely to be more rapid than our own. It is not generally understood that Japan has legally the gold standard, although practically the silver one, and that, after prolonged discussion by a committee in which all opinions were represented, the balance turned in favor of adopting the gold standard in practice as well as theory; the scheme apparently being similar to that favored by the Russian Government. Those of our bimetallists, therefore, who are disturbed by the advantages possessed by silver-using countries, may, if they will be patient, see Japan removed from the list of competitors.

Of Mr. Max Wirth's contributions we find that on German banking perfunctory and disappointing, while that on banking in Austria-Hungary is in most respects excellent. Of the other meritorious treatises we can say nothing except that they will be found valuable by those who have occasion to consult them; while of the whole work we can only repeat that it is a splendid monument of the enlightened enterprise of its publishers.

Pennsylvania: Colony and Commonwealth. By Sydney George Fisher. Philadelphia: Henry T. Coates & Co. 1897. Pp. xiii, 442.

MR. FISHER has here continued the account of Pennsylvania history begun in his volume entitled 'The Making of Pennsylvania,' noticed in these columns somewhat less than a year ago. The earlier volume was, in the main, a study of the numerous race elements that went to make up the heterogeneous population of the colony; the present volume traces the history of Pennsylvania from its foundation to near the close of the last century. There is an unimportant chapter on Pennsylvania in the Civil War, and another on the "preëminence of Philadelphia"; but, on the whole, "colony" so far overshadows "commonwealth" that the title of the work does not accurately indicate its scope. The treatment is of a popular character, and does not lack a measure of interest; but the style is often inelegant and even "slangy," while the inordinate emphasis and general lack of dignity serve very greatly to mar what might otherwise be a useful and attractive book.

In order, apparently, the better to set off the virtue of Penn in his dealings with the Indians, Mr. Fisher is at pains to combat, on moral grounds, the accepted legal doctrine that uncivilized peoples had no title to land save that of occupancy, and to show how "it remained for the Supreme Pontiff to announce that Christianity was a good excuse for theft" (p. 99); and when, as years went by, the promise of Penn in his famous treaty was still unbroken, he tells us that "in France and on the continent of Europe the great men and writers seized upon it as the most remarkable occurrence of the age" (p. 109). He seems to approve the popular idea, in the colony, of the great wealth of the Proprietors, though he is careful not to endorse Franklin's partisan and exaggerated estimate. In general, Mr. Fisher's prejudices are so strong as to leave him no peace until every enemy is twice dead. Franklin's pamphlet on 'The Nature and Necessity of a Paper Currency' not only was "a very crude performance," but went unanswered because no reply was needed to such "rubbish and nonsense." Parkman's "absurd abuse of Pennsylvania," caused by his "violent prejudice against every colony outside of New England," is not, of course, allowed to go unrebuked. On the other hand, the author can praise as extravagantly as he can blame, as when, in his laudable effort to revive the fame of Bouquet for the latter's brilliant defence of the Pennsylvania frontier in 1764, he asserts that "no single person . . . has ever before or since done [the State] such a service."

In dealing with the important period immediately preceding the declaration of national independence, Mr. Fisher has, we think, exaggerated the disposition of the patriot party to carry things with a high hand, and the disastrous effects, in some directions, of their arbitrary conduct. Moreover, to say that Massachusetts "intended independence from the beginning"; or that the object of the Continental Congress, in its resolution of May 10, 1776, was to weaken the conservatives by breaking up the charter governments, and so make independence easier of attainment; or that in Pennsylvania the resolution "made more Tories than patriots," is to give to facts a forced and even doubtful construction. A

more careful study of Dickinson's career would not be likely to sustain Mr. Fisher's judgment that Dickinson had "a superb moral courage, in which he was equalled by no other character in American history"; while to imply that we ought to celebrate the 2d rather than the 4th of July, because the resolution in favor of independence was adopted on the former date, is to take up the cudgel for an old contention long since forgotten, and, we may add, settled. In short, Mr. Fisher seems to be first a Pennsylvanian and after that an historian; and, from either point of view, his book leaves a great many things to be desired.

The Principles of Sociology. By Herbert Spencer. Vol. III. D. Appleton & Co. 1897.

THE completion of an edifice is seldom an occasion of so much public interest as the laying of the corner-stone; and this is conspicuously true of Mr. Spencer's work. When we consider that he began the 'Synthetic Philosophy' six and thirty years ago, and compare the conditions of human thought now and then, we realize that a revolution has been quietly accomplished. To the young student of natural science to-day it must seem astonishing, not that Darwin's theories should have been brought forward, but that the bringing them forward should have occasioned a violent and prolonged tempest. Such students can probably not comprehend the intellectual darkness in which even the educated classes were then groping. Nor can they form any idea of the narrowness of the bigotry then prevailing among the religiously disposed. To the modern mind nothing can seem more absurd than the notion that species must have always existed just as we know them now, except the reason assigned for this notion—that certain statements in the Hebrew Scriptures, of unknown authorship and doubtful date, might be interpreted so as to give it support. Incredible as it may seem, such notions and such reasons formed part of the mental constitution of civilized man at that time; and if this is no longer true, it is largely due to Mr. Spencer's influence.

To have been potent in bringing about such a change might seem enough to gratify ordinary ambition. But the philosophy of Rabbi Ben Ezra,

> "What I aspired to be
> And was not, comforts me,"

is too high for Mr. Spencer, as it is for most mortals. Nor is he exultant over what he aspired to be and was. He has finished his allotted task, but his chief pleasure is in his emancipation. Still, he admits, "there is satisfaction in the consciousness that losses, discouragements, and shattered health" have not prevented him from fulfilling the purpose of his life. Certainly if this is not satisfaction of the highest kind, few there be that shall be satisfied.

Two of the three divisions of this volume have already appeared in print, and have therefore received due notice ere this. The third part, 'Industrial Institutions,' applies the theory of evolution, it must be confessed in a somewhat weary and perfunctory way, to the chief elements of the social system. We do not say that Mr. Spencer's powers have flagged; on the contrary, the phenomena of industrial life—division of labor, specialization of functions, slavery, serfdom, free contract, the gilds, coöperation, trade-unionism, tc.—are of a kind to afford many beautiful instances of evolution, and he is equal to his opportunities. But it is easy to see that Mr. Spencer's natural optimism is grieved by the socialistic tendencies of the day. He tries to comfort himself with the reflection that this is exactly in accordance with his theories. All progress, he explains, is rhythmical, and as we have had in the middle of the century an era of increasing freedom, so we may expect an era of decreasing freedom at its close. It is true that there is a wealth of consolation in being able to say, "I told you so," but, as Mr. Spencer's philosophy is sufficiently elastic to cover the happening of good things as well as bad, he would of course prefer to have the good things happen.

We apprehend that Mr. Spencer, like others of the millenarian school to which he really belongs, has fallen into the natural mistake of putting the date of the "Saturnia regna" too early. It is doubtless true that the process of evolution, in the case of mankind, has been in the latter centuries accelerated. Large numbers of men are, upon any reasonable reckoning, not only more comfortable than their forefathers were, but in specific respects better. Nevertheless, inspection of the human heart reveals the existence of such a considerable residuum of wickedness as to make the attainment of perfection, or equilibrium, as Mr. Spencer would call it, a very remote possibility. Theoretically the race may eventually reach this stage of development, but practically we must leave this contingency altogether out of view in our calculations.

In fact, we are tempted to apply, to Mr. Spencer, Hawthorne's remarks on one of the enthusiasts of his creation. Like the latter, Mr. Spencer had in his youth "that sense, or inward prophecy, . . . that we are not doomed to creep on for ever in the old bad way." His error, like Holbeach's, lay "in supposing that this age, more than any past or future one, is destined to see the tattered garments of antiquity exchanged for a new suit, instead of gradually renewing themselves by patchwork, in applying his own little life-span as the measure of an interminable achievement, and more than all" (although it is scarcely fair to apply this to Mr. Spencer) "in fancying that it mattered anything to the great end in view whether he himself should contend for it or against it." It is clearly true that as the years have settled down more weightily on Mr. Spencer, the "haughty faith" with which he began life has been "modified by inevitable experience." But it has not been extinguished. There must eventually be produced "a kind of man so constituted that, while fulfilling his own desires, he fulfils also the social needs." The days may now be evil. An entire loss of freedom may be the fate of those who do not deserve the freedom they possess. But none of these things causes Mr. Spencer to recede from the belief expressed nearly fifty years ago, that "the ultimate man will be one whose private requirements coincide with public ones. He will be that manner of man who, in spontaneously fulfilling his own nature, incidentally performs the functions of a social unit, and yet is only enabled so to fulfil his own nature by all others doing the like." And so, to the discomfiture of many narrow-minded dogmatists, Mr. Spencer passes from the stage with a belief in the future happiness of mankind as elevating, and perhaps as comforting, as the belief in his own future happiness is to the ordinary Christian.

A Brief History of the Nations and of their Progress in Civilization. By George Park Fisher, D.D., LL.D., Professor in Yale University. New York: American Book Co. 1896.

WE fully appreciate the difficulties by which the author of a short universal history is beset, and we are therefore far from wishing to suggest an unattainable standard of merit. Each new candidate for honors in the field of elementary outlines must be allowed much individual latitude. Freshness of ideas, freshness of style, even freshness of illustration, will be held to accredit any recruit to the dense battalion of compendium-writers. We wish we could welcome Dr. Fisher's manual on one or all of these grounds. If we are unable to do so it is because we find it without distinctive excellence.

Dr. Fisher's chief virtue is clearness and simplicity of style, his chief fault is uniform monotony of narrative. A good introductory sketch ought to resemble a relief map. Dr. Fisher's chapters present the appearance of a plane surface. He loads his pages with the names of persons and events which will be at once forgotten, while he fails to emphasize sufficiently the leading and typical characteristics of the periods he touches. Another failing is paucity of interesting stories and illustrations. A writer of Dr. Fisher's erudition ought to be able to select a better class of anecdotes than is here presented. We are reminded at each step of Smith's 'Shorter History of Greece' and of Collier's 'Great Events,' rather than of any contemporary sources. We do not mean to imply that Dr. Fisher himself has failed to go to the fountain-head. We only state that he does not revive us with copious draughts of water from the rock. The citation of a passage from the funeral oration of Pericles furnishes a rare exception. Dr. Fisher is also unhappy in his attempt to compress the artistic and literary features of a given period.

We shall not attempt to impugn the substantial accuracy of the present volume. Considering the large number of facts adduced, the work of revision has been very careful. On the whole, the classical section is better done than the mediæval and modern sections. Beginning with the German Inroads, a certain number of slips appear. We venture to append some of them in the hope that they may be corrected. On p. 209, Dr. Fisher states that "Rome, in the course of half a century, was the object of four terrible attacks—that of Alaric and the Visigoths; of Radagaisus, with the Suevi, Vandals, and Alani; of Gaiseric (Genseric), with the Vandals; of Attila, with the Huns." But Radagaisus was arrested at Fiesole, and Attila turned back from the Mincio. P. 210, Athaulf, Alaric's successor, was not his brother, but his wife's brother. A misapprehension is conveyed in the statement that, "by the insidious arts of Aetius, the Vandals were led to invade Africa." They passed over from Spain on the invitation of Bonifacius. A serious mistake is made on p. 212: "In 453 he [Attila] died suddenly, and the strength of the Huns was dissipated by the rivalry of his chiefs contending for the crown." The fact is that Attila's sons were overthrown at the battle of the Netad, by a rising of the Ostrogoths and other subject races. P. 320, Joan of Arc was not captured before Paris, but at Compiègne. Dr. Fisher says little about Switzerland, but three errors have crept into his notice of that confederation. The sentence, p. 325, "Switzerland, originally a part of the kingdom of Arles,

had been ceded with this kingdom to the German Empire in 1033," contains at least two mistakes. It is wrong to refer thus early to Switzerland as a unit, and by no means all of mediæval Switzerland was comprised within the kingdom of Arles. On the same page the original league is ascribed to the "three mountain cantons." Dr. Fisher should not say, p. 446, that "on the death of Clive, Warren Hastings was made Governor-General (1772)." Clive died in England in 1774 after retiring from the public service. After the failure of the Hungarian rising of 1848, Kossuth escaped to Turkey, not to Italy. The student is certain to be misled by Dr. Fisher's phrase about the establishment of English government in Canada. "In 1774 the royal government was introduced, which brought in the inhuman criminal code of England." This sentence entirely misrepresents the scope and intent of the Quebec Act, and no further information is vouchsafed. We might extend this list, but the proportion of loose to exact statement is relatively slight.

We pass rapidly over omissions, for a book of this kind must exclude without remorse; yet it does seem strange that Dr. Fisher should touch upon Spartan society without mentioning the helots, should neglect to state that Syracuse received aid from the Lacedæmonians against the Athenian expedition, and should dismiss Etruscan origins with this doubtful phrase: "They were not improbably Aryans, but nothing more is known of their descent." The Armada, the Wagram campaign, the Peninsular War, and Catholic Emancipation are left undated. The existence of Mehemet Ali is not even hinted at. Worse than these omissions is a lack of precision. The three Benedictine vows are brought into the time of Constantine, p. 195. The issue of assignats is described in the same breath with the abolition of privileges and before the march to Versailles, p. 467. The dates of Cato the Censor, 289-149, the execution of Boethius in 424, and the battle of Tours in 720 may be placed upon the Atlantean shoulders of the printer.

Thirty years ago Dr. Fisher's 'Brief History of the Nations' would have been ranked considerably higher than we have put it. Even at present it may, in the hands of a judicious teacher, be of great service. The maps are admirable, and the pictorial reproductions of buildings, armor, and portraits are very fair.

BOOKS OF THE WEEK.

Adeney, Prof. W. F. How to Read the Bible. Whittaker. 50c.
A Popular History of the United States. A. S. Barnes & Co.
Burgess, Prof. J. W. The Middle Period, 1817-1858. [The American History Series.] Scribners. $1.75.
Burrell, Rev. J. B., and Rev. J. D. The Early Church: Studies in the Acts of the Apostles. American Tract Society. $1.25.

HENRY HOLT & CO.,

29 WEST 23D STREET, NEW YORK,

HAVE RECENTLY PUBLISHED

Telepathy and The Subliminal Self.

Hypnotism, Automatism, Dreams, Phantasms. By Dr. R. OSGOOD MASON. 12mo, $1.50.

Boston Advertiser: "Scientific, yet in the best sense of the word popular. . . . There is a great need of such a book."

Boston Transcript: "The latest treatise of this kind worthy of notice. . . . He repudiates the idea of the supernatural altogether, and in this he is in accord with the best thought of the day. . . . Interesting and logical."

Hartford Courant: "The work of a scientist, not of a crank. . . . Fascinating reading."

Chicago Tribune: "Certain to attract wide attention. . . . We defy any conscientious sceptic to read the book without believing more than he did when he began . . . Thoroughly interesting if merely for its curious narratives. . . . The spirit of the work is such as to deserve respectful attention from every scientific mind. . . . A sneer is no longer an answer to such a book."

A Diplomat in London.

(1871-7.) By CHARLES GAVARD. 12mo. $1.25.

N. Y. Times: "Where he is simply delightful is in his descriptions of English life. . . . A singularly attractive volume, and possessing a decided historic value."

N. Y. Evening Post: "Many well-known figures flit across the Frenchman's pages, not a few Americans among them."

ELEMENTARY
Text-Book of Physics

By Prof. WM. A. ANTHONY
And Prof. CYRUS F. BRACKETT.

REVISED BY

Prof. WILLIAM FRANCIS MAGIE,
of Princeton University.

Presenting the fundamental principles of Physics, the experimental basis upon which they rest, and, so far as possible, the methods by which they have been established.

8th Edition, revised. Small 8vo, cloth, $4.00.

JOHN WILEY & SONS,
53 East 10th St., New York.

SEND IN YOUR NAME AT ONCE to the Readers' Co-operative League, Box 223, Brooklyn, N. Y., if you wish to receive Free Specimen Copies of all the leading periodicals of the United States. Also send the names of your friends *who are readers.* Enclose stamp for reply, giving plan.

HATCHARDS.

This is the favorite BOOKSTORE, and for 100 years the resort of the smartest people in London. It is visited and patronized by all who love books. London is the great market for books, and all the best as well as the cheapest editions can be had by writing here. Special collections formed, and fuller information supplied than from any other house. Books, both old and new, and relating to any subject, can readily be supplied, at very moderate prices.

Agents for Clubs, Libraries, and all private collectors.

187 PICCADILLY, LONDON, W.

JUST PUBLISHED.

The Will to Believe
And Other Essays in Popular Philosophy.

By WILLIAM JAMES, LL.D., Professor of Psychology in Harvard University. Large crown 8vo, pp. xvii+332, cloth, gilt top, $2 00.

YALE MIXTURE.

The choicest tobacco made, and preëminently a gentleman's smoke.

Marburg Bros., The American Tobacco Co., Successor, Baltimore, Md.

The Nation.

NEW YORK, THURSDAY, MARCH 18, 1897.

The Week.

VARIOUS accounts agree that President McKinley thinks he has found the solution of the patronage puzzle in the old system of making Senators and Representatives "get together." If they will only come to a perfect agreement and tell him what they want, he will do it, but there must be no factions, no differences, no splits in the party, no intrigues or grievances; all is to be union and contentment, and the common enemy is to get no comfort out of quarrels over the spoils. Now, if this were true, which we can scarcely credit, it would show that Mr. McKinley had not mastered the rudiments of the doctrine of civil-service reform; he would be yet in his sins, as the apostle says. Was not the "getting-together" theory tried for years, with the result only of the worst factions and quarrels and disgraces and defeats the party has ever known? When spoilsmen get together, it is only to fight the more bitterly at short range. And what sort of nominees are likely to issue from such a system? What style of man must he be who is willing to do the dirty work, not merely of one Senator, but of two? Is the civil-service-reform law likely to be administered, in letter and in spirit, by such a head of department? President McKinley's friends and advisers should hasten to tell him that this alleged system of placating the spoilsmen and harmonizing the party has been proved over and over again a fruitful mother of furious quarrels and of fatal treasons, stratagems and spoils in the party. Never was there a more misleading cry of peace, peace, when there is no peace.

Speaker Reed's reëlection places him in a position of extraordinary power, with what must be extraordinary freedom from pledges limiting that power. The question is what use he will make of it. The Speaker's control over legislation is now, under the rules and practices of the House, almost absolute. Mr. Reed can certainly shape the new tariff bill, for instance, in ways wholly impossible to Mr. McKinley. The people know this now. The time has passed when the Speaker could exercise his vast power unsuspected. Nor can he shirk his responsibility. No bill can pass the House without his passive approval, and that, in effect, is the same thing as active advocacy. It is Speaker Reed, more than any other one man or set of men, who will give us our new tariff. What kind of tariff will he make it? Will he acquiesce again, as he did in 1890, in a bill which he believed, and freely stated in private, to be extreme and certain to lead to a terrible reaction? The next three months will answer this question. Meantime, Mr. Reed should reflect that whatever political ambition he may cherish has a chance of being gratified only by a return to his early manner. He was thought of as a Presidential candidate solely because he had shown himself a bold, strong man, not afraid of initiative and not dreading responsibility. The moment he took up the rôle of dev'lish sly politician, he was lost. He has now another opportunity, and the country will be curious to see how he uses it. We may add that the wish to render true service to his party and to the public would equally demand that Speaker Reed should not abdicate, but should exert his power and give us a tariff which will be neither monstrous nor obsolete.

The objection to having Judges of the Supreme Court act as arbiters under the arbitration treaty is rested on the ground that they may have already formed opinions and expressed them in the shape of judicial decisions. This, according to one leading commentator, would prevent them from "acting untrammelled" for the country's best interests. This idea rests, like so many others expressed about arbitration, on a misapprehension. The mistake lies in a confusion between opinions previously formed and expressed about a controversy itself, and opinions previously formed and expressed on points of law which may become involved in it. The former is a good objection to a judge; the latter is one of his most important qualifications. It is, in fact, merely proof that he has a good knowledge of law. If a Judge of the Supreme Court, for instance, had decided that the Clayton-Bulwer treaty clashed with the Monroe Doctrine and overrode it, it would be absurd to put him on a court to pass upon the matter. On the other hand, the more questions he has investigated and decided with regard to treaties and international law, the more general knowledge he has of the principles applicable to this or any other novel question. In the present arbitration between England and Venezuela, an arbitrator who has repeatedly decided questions as to the effect of actual occupation of territory would be in so far qualified to pass on the boundary question; it would only be in case that he had actually decided that the true boundary was the Schomburgk or some other line, that he would be disqualified.

There are a number of questions pending between the United States and England which might come before the proposed arbitration court. We have just referred to the Clayton-Bulwer dispute; the fisheries question is another. These disputes, as they stand, have never been before the Supreme Court; there is no way of getting them before that body, and its decision, if rendered, would not be binding. No doubt, however, there are a number of legal questions involved, such as the force and effect of treaties, and the *mare clausum* question, which have already been either before the Supreme Court or before particular Judges of the Supreme Court in former arbitrations; and so far as such questions have been examined and considered by them, in so far are they preëminently qualified to act in new cases. The real reason why this qualification is brought up as an objection is because those who make it do not want questions between this and other countries decided by rules of law, but by some other means. Mr. Keasbey, for instance, who wrote a great book the other day on the Nicaragua Canal question, says that, according to international law, the Clayton-Bulwer treaty is binding, but that we must take higher ground. Any one who entertains this view must loathe the idea of the submission of the controversy to a judge.

The Consul-General of the United States at Honolulu has just struck a nefarious blow at Hawaiian annexation. He has given out the results of the census lately taken in Hawaii. This shows the total population of the islands to be 109,020, the native Hawaiians numbering 31,019, the Japanese 24,407, the Chinese 21,616, the Portuguese 15,191, half-breed Hawaiians 8,485, with scattering Americans, British, Germans, etc. Consul Mills may try to shelter himself under the pretence of a love for statistical information in the abstract, but that will hardly pass. Why should he have chosen the very beginning of the McKinley administration to bring out the fact that a proposition to annex Hawaii is a proposition to annex 70,000 Chinese, Japanese, Portuguese, and half-breed Hawaiians? Was he aiming to put Annexationist Lodge, with his educational-test immigration bill, in the deepest of holes? The Consul is evidently meddling with things that do not concern him. He should be removed, and a new census should be taken, or else the old one extensively altered.

Twenty-five trade associations met at Young's Hotel, in Boston, on March 8, and decided to petition Congress to pass a bill authorizing the President to appoint a banking and currency commission. They demand the gold standard and the gradual retirement of the legal tenders, and favor the issue of currency by the national banks to the par value of

their bonds, and a reduction of the tax on circulation. They also recommend additional banking currency, based on assets, under national supervision, safe, elastic, and redeemable in gold, and the establishment of banks, with a capital of $25,000 or more, in small towns and villages. The one important thing is that they demand action. The future of the currency question is very dark, but there is one consideration that is encouraging, and that is the appearance of an organized effort for currency reform among the classes directly suffering from the free-silver agitation. That is something new.

The charter was "jammed" through its first stage on Thursday evening in a thoroughly scientific manner. Those members of the Commission who could be depended upon to favor whatever Platt wished, went to Albany to join the members of the Platt city committees of the two houses in "considering" the amendments which had been proposed at the hearings. The result of this solemn consultation is thus announced: "Not one of the amendments of any importance suggested at the hearings was entertained favorably by the Commissioners or accepted by the committees." Why take the trouble to hold a consultation to bring about a foreordained result? Platt announced several weeks ago that the charter was to be passed without amendment, and all his hired men had their minds made up for them when this decision was proclaimed. Hearings and consultations are relics of the old style of government and have no place in the new system. They do not deceive any one, and have about them an air of humbug which is not in keeping with so bluff and bold a ruler as Platt. "Jam 'er through and say nothing," is the genuine Platt method of legislation.

President Low's letter to Mayor Strong gives pretty plain indication that he regards the Platt Government's State police bill as a serious blow to the pretence that the new charter contains a "large measure of home rule." He says "the bill raises the fundamental question of an unusual interference with the local prerogative just at the moment when a charter is pending that aims to give to the greater city larger and not less control of its destinies," and he thinks that the "local prerogative" should be contended for vigorously by the local authorities, whose "trumpet should utter no uncertain sound in summoning the citizens to this controversy." Mr. Low seems to think that defeating Platt's bill will in some way prevent the city from like interference in the future in case the new charter be adopted; but it is difficult to see how he arrives at that opinion. The fundamental defect of the charter is that it not only does not protect us against such interference, but makes it inevitable. It is not final legislation, but initiatory legislation; it is merely the beginning of endless legislation and endless interference. It is upon this point that the trumpets of all advocates of good government for the city should "utter no uncertain sound," and keep on uttering it until the enactment of the charter is prevented and steps are taken to secure for us a real charter in its place. Mr. Low speaks of the police provisions of the new charter as "manifestly dangerous," and so they are, but they are no more so than the Municipal Assembly provisions, and no more so than the charter itself.

Our State Government left this city for Washington on Sunday evening after an unusually busy and fruitful day's work. His most trusted agents were at his hotel early that morning, and the executive session began promptly and continued without interruption till quite late in the afternoon. The results were given out to the reporters in the usual way at the close, and were published in the morning papers. This gracious practice on the part of our Government enabled us to know on Monday just what would be done by his Legislature and other branches during the week. The four great matters considered were the new charter, the State police bill, the amendments to the liquor-tax law, and the Ellsworth newspaper-portrait bill. The Government decided that the charter should be introduced on Wednesday, and be "jammed" forward steadily from that date; all the agents agreed to do their best to carry out this decree. Agent Lauterbach reported to the Government that the newspaper reports of a tendency to insubordination on the part of Agent Black towards the State police bill were entirely unfounded, that Agent Black was in hearty accord with the Government, and that the bill would go forward without obstacle whenever the Government thought best to have it start. The Government decided upon its introduction at once, on Monday night, if Agent Lauterbach could get to Albany with it, and decided also that the Wray power-of-removal bill should be "shunted" when the Lauterbach bill appeared. Agent Raines had a long hearing on his liquor-law amendments, and the Government decided in favor of their introduction, much to the chagrin, it is announced, of Agents Lauterbach, Jake Worth, and Abe Gruber, who question the political expediency of the amendments, but bow humbly to the superior wisdom of the Government. The Ellsworth portrait bill received the Government's prompt approval, it being urged that the religious and moral sentiment of the State was strongly in its favor.

The thoughtful report on Trusts made by the Lexow committee last week offers no remedy, but maintains that the evidence did not show that Trusts lowered prices to the consumer; that it *did* show that they lowered the price of the raw material; that it did not show that the product was more perfect; that it did not show that Trusts gave better wages and more constant employment to laborers; that it did show, however, that Trusts gave greater stability of price to the consumer; that it did show the issue of stock certificates of greatly inflated value, giving rise to much speculation. But we are chagrined to find that, after laying these important discoveries before the public, the committee admitted that "it could not at this time suggest a remedy." The simple bill which the committee reports, that the Attorney-General, when he sees something going on in the commercial world that he does not understand, should have power to summon witnesses to explain it to him, strikes us as, under the circumstances, almost ludicrously inadequate. What we want is a law that will make Trusts really useful to the community, instead of being, as now, harmful or worthless. The facts on which legislation should be based are now, thanks to Mr. Lexow and his able coadjutors, in our hands. Why, then, does the Legislature stand idle and powerless?

The Court of Appeals, in the case of Curran vs. Galen, decided, week before last, a question of growing importance. Curran, in his complaint, charged that the defendants, some of whom were individuals, and one an Assembly of the Knights of Labor in Rochester, had conspired to injure him and take away his livelihood. He said that they threatened him that unless he would join the Assembly, pay the initiation fee, and subject himself to its rules and regulations, they would obtain his discharge from the employment in which he then was, and would make it impossible for him to obtain any employment unless he became a member. In pursuance of this conspiracy, upon his refusing to become a member of the Association, they made complaint to his employers and forced them to discharge him, and, by false and malicious reports in regard to him, sought to bring him into ill repute with members of his trade and employers, and to prevent him from prosecuting his trade and earning a livelihood. The answer set up as a special defence that there existed in Rochester an employers' association, called the Ale-Brewers' Association, and that the ale-brewers had an agreement with the Assembly that all their employees should be members of that body, and "that no employee should work for a longer period than four weeks without becoming a member." Curran, it went on, was so employed for more than four weeks by an Association company after he was notified of the provisions of this agreement requiring him to become a member of the Assembly; he

refused to comply; the Assembly notified the company, and this was the reason of his discharge, and not malice or ill-will.

This answer was demurred to, and the Court of Appeals says it is good for nothing, because it states no legal defence. The Judges might have added, though they do not, that it is in fact nothing but an elaborate description of the very injury of which Curran complains. The court says that the agreement which it sets up cannot be upheld, because it is against public policy; that the interests of society favor the utmost freedom in the citizen to pursue any lawful trade or calling. That employers should enter into such agreements as that described in the Curran case shows, no doubt, the power of the unions, and they are just as dangerous to the employers themselves, all experience testifies, as they are illegal. What employer who cannot give out work to whom he pleases can ever know where he stands? If he submits to one illegal demand, what will be the limit of the demands made upon him? He is no more free in any proper sense than the employee. He is blackmailed, as the employee is enslaved. But even in New York there are people who are ready to stand up for their rights, and, when they do, the courts will uphold them in it.

The New Jersey Legislature has but a few days remaining in which to show the people that there is some excuse for its existence, as it is agreed that final adjournment will not be delayed longer than next week. That the session up to this date has been wholly barren of results is admitted. With only three Democrats in the Senate and four in the Assembly, the responsibility for the character of the session is easily placed. That the political tone in Trenton has been lowered since last winter is evident to any observer. The Governor has "set the pace" for the law-makers in the character of some of his principal nominations, and the detesters of "magazine politics" have rushed after him pell-mell. The chairman of the railroad committee of the House has been rebuked more than once by having bills taken out of his possession, but we do not recall any of these "popular" measures that have reached the Governor. The test of the winter's work will come on the votes on the constitutional amendments. Not many new laws are needed in the State, and the law-makers will be thanked rather than criticised for not swelling the folios of the statute-book. But the changes demanded in the State Constitution promise so much for the good of the people that to defeat them will be a real misfortune. There are more ways than one to bring about this defeat. There is but one way to secure their speedy ratification, and that is, to send them before the people—all of them—just as they were passed by the Legislature last year.

The great Leadville strike which has been declared off after a loss of $4,000,000 to the mine-owners and as much more to the strikers, and the killing of at least a dozen human beings, was begun about the middle of June, 1896. The ceremony of declaring it off was quite as futile as any part of the affair, since the mines have been in full operation for several weeks with hands obtained from other parts of the country. The strike had its origin in a demand that a very limited number of unskilled laborers, working on the dumps at Leadville at $2.50 per day, should receive the same wages as skilled laborers, $3 per day. Even this demand was not made by the Leadville miners in the first instance, but by some walking delegates from the Cœur d'Alene region who were out on a tour of inspection, and who made a visit to Leadville, where they found the anomalous condition prevailing that common laborers were receiving fifty cents per day less than skilled laborers. The Leadville Miners' Union had no idea how infamous this practice was until the Cœur d'Alene men told them. The walking-delegates assured them that the demand for equalization had been conceded at Cœur d'Alene, and hence there could be no doubt that it would be conceded at Leadville. So the demand was made, and when it was refused the strike was ordered, with all the loss of money, all the bloodshed and loss of employment that we know of. The poor men who allowed themselves to be led into this fatal blunder have known for weeks that their places had been taken by new hands, but they kept up a pretence of a strike in the vain expectation of being taken back en masse. When that expectation failed and the contributions from outside began to grow slender and the miners' children began to cry for bread, there was nothing to be done but to surrender.

The tone which the English Conservatives hold towards the Liberals when the latter want to be informed of the Government's plans and intentions respecting Crete and Greece and Turkey, is one of pained and impatient superiority. This is especially Balfour's tone. Why do the Liberals ask about these high matters of foreign policy? Do they not boast themselves Little Englanders? Are they not by choice and training merely parochial statesmen? Then let them leave the Tories to conduct all these international affairs in their own imperial fashion. These cool assumptions were eloquently resented by John Morley in a speech at Oxford on February 20. It was indeed, he confessed, the historic Liberal policy to avoid fussy meddling with foreign nations, but what party ever did more to expose and correct international injustice and oppression than the Liberal party of England? What political leaders ever showed more prescience in questions of foreign policy than the great Liberal leaders? Lord Salisbury has now elegantly confessed that, in the Crimean war, England laid her money on the wrong horse. But Cobden and Bright put their money on the right horse. When half of England bet on the wrong horse again in our civil war, Cobden and Bright once more picked the winner. Yet these are the men, theirs the party, charged with caring nothing for international affairs, and unable to see beyond their own noses. Who but a parochial statesman and Little Englander, Mr. Gladstone, opened the eyes of Great Britain and the world to the tyranny of the Bourbons in Naples, and to the system of rapine and murder practised by the Turk in Bulgaria, and called government? Mr. Morley had good ground for asserting that "some of us whom they call Little Englanders have given a steadier attention to foreign affairs, and are better informed as to movements in foreign lands, than these gentlemen who always remind one of the lines, 'Ignorance delivered brawling judgments unashamed on all things all day long.'"

A case involving copyright in an unusual way was lately before the Paris courts. At the time of Zola's latest candidacy for the Academy, a pamphlet was got up by one M. Laporte, entitled "Zola contre Zola." It consisted of extracts, without a word of comment, from the novelist's writings, the effort being evidently to bring together a rare collection of Zola's choicest ordure. The aim was, of course, to show that Zola, the muck-raking novelist, was the chief opponent of Zola, the would-be Academician. Zola's publisher at once brought suit for infringement of copyright, as the extracts were republished without permission. But the Tribunal of the Seine held that there had been no infringement, inasmuch as M. Laporte's intention was "not to reproduce fraudulently the literary property of another, but to bring out in high relief in the work of the author of the Rougon-Macquart novels its profoundly demoralizing character, and, consequently, the impossibility that the French Academy should admit to its ranks the writer who had produced it." The court saw, however, the need of qualifying its decision so as not to allow any one to produce, for example, the works of Victor Hugo in order to prove that he was a great poet or a good man. Accordingly, the court gave it as one of the reasons for acquitting M. Laporte that his pamphlet did not yield "a complete or even a partial notion" of any given book of Zola's. If it had done so, copyright would have been infringed. But the mélange of extracts, without cohesion or connection, did not exceed the rights of a critic. It will be remembered that a case involving somewhat similar issues is now before the English courts.

CONGRESS AND ITS APPROPRIATIONS.

Now that last session's appropriation bills have been extracted from the chaos of legislation with which the Senate closed its work, it has become possible to figure up how much the session has done for the "economy" so fervently professed at the opening of the Fifty-fourth Congress. The story is told by Chairman Cannon of the appropriations committee, and it is pitiful enough. The Fifty-third Congress, Democratic in both its branches, made sufficiently poor show of reducing public expenditure, but it did accomplish something. Each of the Congresses under Mr. Harrison had run up appropriations exceeding a billion dollars; the Democratic Congress from 1893 to 1895 at least cut down the aggregate to $989,239,205. But the Republican Congress whose final session expired last week managed to raise this total to $1,043,437,018, the largest sum placed to the reckoning of any Congress in our history since the war.

In order to understand the actual character of this draft on the public purse, it should be mentioned that while the annual Government revenue steadily declined, between 1893 and 1896, by $52,241,153, with a further decrease, up to date in the present fiscal year, of nearly $17,000,000, the total annual appropriations have increased, since 1895, by $25,872,762. It should be noticed furthermore that while the Democratic Fifty-third Congress, partly by increased revenue, but largely also by lighter appropriations, had reduced the annual deficit from $69,803,260 in 1894 to $25,203,245 last year, their Republican successors instantly went to work heaping up fresh extravagances, until the deficit for the present fiscal year, with three and a half months still remaining to be heard from, has reached already upwards of $50,000,000. Regarding this reckless dissipation of public funds, with the Treasury continually embarrassed, Mr. Cannon speaks with proper frankness. He admits that the appropriations are "in excess of the legitimate demands of the public service," and openly charges the Senators with "adding many old claims, some of them of questionable and doubtful character." Mr. Sayers, reporting for the minority of the committee on appropriations, notices further that, in the river-and-harbor bill which passed a year ago over President Cleveland's veto, one work involving $1,000,000 expenditure has been rejected since as worthless by the War Department, while another appropriation of $4,500,000 has been subsequently placed for half that sum. All this continuing expenditure was loaded upon the present fiscal year.

Mr. Cannon has two explanations for this growing extravagance: excessive estimates by the executive and defective rules of Congress. He affirms that Mr. Carlisle's original estimate for the session's appropriations was actually reduced by Congress. This may be true. The present practice, which, in our judgment, is wholly wrong, is for the Administration merely to lump together department estimates, to add continuing and permanent appropriations, and then to leave the work of equalizing or reducing to the committees. This practice, as we have said, is wrong. The executive ought to be in constant touch with the committees on appropriation, and ought to be able, even before the bill is reported to the House, to expose such swindles as were incorporated in the river-and-harbor bill of 1896. But, rightly or wrongly, such a plan has not been and is not now the rule of legislation. Congress sufficiently understands the Treasury estimates to be preliminary only. The legislative body cannot absolve itself from blame on the ground that it innocently accepted the department estimates as final. As for the work of Congress on its own account, Mr. Cannon is frank enough. The bills are scattered, he explains, among eight separate committees. They are considered with no attempt at mutual responsibility, without the slightest reference to the revenue-raising plans of the ways and means committee; in the one house expert "log-rolling," and in the other "senatorial courtesy," add successively to the heap. When to this is joined the fact that the President must either approve an appropriation measure as a whole, or throw it out entirely, the course of events might easily be pictured in advance.

Mr. Cannon's remedies are the return of all appropriation bills to one committee for their first consideration, and the establishment of a congressional tribunal to consider all the special claims with which appropriation bills are nowadays loaded down, and which have no proper standing in such measures. With both these propositions we are heartily in accord; but whether either would curb the propensity of Congress to extravagance, we doubt. One committee is better able to construct an economical and reasonable measure than are eight committees; but because this one committee could bar out the spendthrifts and the log-rollers it does not follow that it would do so. Excision of the jobbery of private claims would doubtless reduce the aggregate appropriations; but Congress could in a day tack on a fresh provision to the regular measure which would make the claim appropriations petty by comparison. We believe, in short, that only organized party pressure, applied by the strongest leaders of Congress, will check this foolish waste. The Congressman who wishes to bleed the Treasury must be informed that there are larger interests to be considered than his village court-houses, pension agents, and contractor acquaintances in the lobby. We beg to warn the leaders of the coming session that they cannot too soon begin this work of coercion and suppression. The tariff-builders are busily at work to add, as they expect, some forty or fifty millions to the revenue. Whether the methods they are using will achieve their ends or not, is something of a question. But if they do succeed in making good the present deficit, through increase in the revenue, how long do they imagine Congress will delay in adding another twenty-five millions to the appropriation bills, creating another deficit, as was the case in 1896 and 1897? Is it to be supposed that a greedy congressional spendthrift will grow suddenly economical merely because he sees a larger annual fund on which to draw? If so, he will be a notable exception in the community of spendthrifts. We present these queries, with all due respect, for the leaders of the House to ponder.

WALLOWING IN THE TARIFF MIRE AGAIN.

THE McKinley-Dingley tariff programme is at last before Congress and the country. The President's message and the bill reported are near of kin. They are, in fact, twin "brothers of Satan," as the Koran calls spendthrifts. But it is to the Christian Scriptures that one must turn for an adequate characterization of the action which is now proposed to the Republican party by its leaders, and which is nothing other than the dog returning to his vomit again, and the sow that was washed to her wallowing in the mire.

We are sorely disappointed in President McKinley's message. This is not alone because he omitted to say a word about the great issue on which he was elected, and to which there is the most urgent need of Congress giving speedy attention. That omission may be repaired later, and we acknowledge Mr. McKinley's right to put the question of revenue first. But what he says about revenue is both weak and disingenuous, and the only programme discernible in his message is one of public extravagance mounting higher and higher. What else can be meant by his call for "ample revenues" for "the prompt payment of liberal pensions"? Are we to have still more profligate pension bills? The present pensions have always been paid promptly. No one has proposed to cut them down. It is impossible, therefore, to see in the President's words anything but an invitation to reckless expenditure and to a fresh pension orgy. But Mr. McKinley's use of figures to prove that his own tariff bill of 1890 was a success as a producer of revenue, is a petty juggle of which he should be ashamed. There is no secret about the way Secretary Foster forced a balance. But for his using the $54,000,000 bank-note redemption fund, which had always been held as a trust fund in the Treasury, there would have been a deficit of $52,000,000 in 1893, instead of a

nominal surplus of $2,000,000. In fact, Secretary Foster, in his testimony before the ways and means committee, on February 25, 1893, insisted that an increase of $50,000,000 a year in revenue was absolutely essential to Treasury solvency. The new McKinley bill may produce sufficient revenue, but it is an historical fact that the old one did not. Even a President's message cannot alter the facts.

Of the new bill itself, as reported and expounded by Mr. Dingley, we can to-day speak only of the broad features. As for the agricultural schedules, we may take the word of that good, but now disgusted, Republican authority, the Philadelphia *Ledger*, that they are only a fresh attempt "to hoodwink the farmer." The high duties of the metal schedules, on crockery and glassware, on wood and jute and linen, are a ghastly farce, from the point of view of revenue, and constitute a standing invitation to domestic manufacturers to form a Trust and exact the uttermost farthing from the consumer. But it is the wool schedule which is the most nefarious. It was the original McKinley wool schedule which did more than anything else to wreck the Republican party in 1890. Of the Dingley schedule it is sufficient to say that it is worse than the McKinley schedule. By a trick of classification the rates are made actually higher. How this was brought about is no secret. This schedule was crammed down Mr. Dingley's throat. He is himself a woollen manufacturer. He knows that all the woollen manufacturers are aghast and furious at these outrageous rates. The woollen manufacture is now on a better basis in this country than ever before. Free wool has made possible the production of whole lines of goods never before attempted here. But the high rates on wool threaten to end all that. Why did Mr. Dingley surrender? He was raided by the Westerners. Three or four Populist and free-silver Republican votes in the Senate were to be had for the bribe of high rates on wool, and so reason and decency and the woollen manufacture had to be thrown to the winds.

Mr. Dingley's estimate of the revenue to be derived from his bill will make Congress sympathize with the old exciseman who resigned when Gladstone was Chancellor of the Exchequer, and who said that his head was simply breaking down under the proposals of his chief. First, Mr. Dingley figures out a total increased revenue of $112,000,000. He stands off and admires this for a while, and then regretfully admits that his figures are too large. Then he begins whittling them down at an alarming rate, and finally claims $70,000,000. This sum he hopes to get, provided wicked American manufacturers and consumers do not help themselves to free raw materials and to cheaper goods while they may. Of this lower estimate it is sufficient to say that he figures $11,000,000 increase from the duty on wool the first year. Men in the wool trade say he will be lucky if he gets $1,000,000. Mills have not been borrowing money to stock up with free wool solely for the pleasure of buying dutiable wool in vast quantities. He also estimates an increase of $14,000,000 on woollen goods—this from a bill which is especially designed to shut out woollen goods altogether. The truth is, that this is all the wildest guesswork. As a revenue bill, the Dingley tariff is as truly a leap into the dark as was the McKinley tariff. Senators Aldrich and Allison were $40,000,000 out of the way as to the revenue under the McKinley tariff the first year. Mr. Dingley may easily be as much now. Meanwhile, Congress will jump at the assurance that there is to be money enough for everybody, and will, encouraged by the President, shoot up the appropriations so as to make a deficit even if Mr. Dingley's hopes of revenue are fulfilled.

It is our deliberate judgment that the Dingley bill is a fraud on the party and the country. Already it is clear, from Republican revolt, that the party did not expect and does not want such a bill. Upon the country it comes like the snapping of a trap. The only thing comparable to it is our electing Platt Senator when we thought we were saving the country from Bryanism. The protective-tariff beneficiaries took advantage, just as Platt did, of the nation's absorption in saving its honor, and now come in to exact the pound of flesh for which they bargained. But the bill is not yet passed. The truth about it will be told in Congress by Republicans, if they do not lose all their manhood—at any rate by Democrats. It will certainly be proclaimed in the Republican press. For our part, we shall spare not in exposing tariff iniquities in 1897 any more than we did in 1890.

A GREAT STEP ONWARD.

We have been much pleased with a bill introduced into the House of Representatives at the last session of Congress by Mr. Gillett of Massachusetts. It is evidently part of the great wave of moral reform which is sweeping over the legislatures of our country, and which has led, even in Kansas, to vigorous efforts for the enactment of the Ten Commandments, the open violation of which has long been a great national affliction and disgrace. The present bill is due to the decision of the Supreme Court that Congress has no jurisdiction over Trusts, that they must be dealt with by the States. Mr. Gillett has considered how to get round this decision, and has found a complete remedy in the jurisdiction of Congress over interstate commerce. He has accordingly framed the following important measure, and it has been favorably reported by the learned judiciary committee. We may say here that reports that Mr. Gillett and the judiciary committee are all under age are infamous and probably Mugwump slanders. Here is the bill:

> "Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That any property owned or manufactured under any contract or by any Trust or combination or pursuant to any conspiracy forbidden by the laws of a State, and being in the course of transportation from such State to another State, the District of Columbia, a Territory, or a foreign country, or to such State from another State, the District of Columbia, a Territory, or a foreign country, shall be forfeited to the United States, and may be seized and condemned by like proceedings as are provided by law for the forfeiture, seizure, and condemnation of property imported into the United States contrary to law; and every person who shall, knowing that any property was owned or manufactured in any of the ways above described, transport it, or cause or order or contract for its transportation as above described, shall be deemed guilty of a misdemeanor, and on conviction thereof be punished by a fine not exceeding $20,000, or by imprisonment not exceeding five years, or both: Provided, that nothing herein contained shall be held to interfere with any proceedings in a State court for the violation of the law of such State."

We hate to criticise such a measure at all, but we feel bound to say that this does not go far enough. Why should its provisions be confined to "property" manufactured by a Trust or combination? Why not extend it to *any* property produced by processes, or contracts, or arrangements condemned either by the State law or the still higher law of morality? Why, in fact, is it not made to cover all property produced by bad men, whose motives are low, and whose aims are, in all probability, prejudicial to the public welfare? In our humble opinion, the transmission of such property to another State by any public carrier, or otherwise, should be prohibited, and the property, if necessary, seized *in transitu*.

Suppose a man is manufacturing a product, and paying his workmen and workwomen only sweating wages; suppose it is a notorious fact that his relations with some of his female operatives are illicit; suppose he is producing really an adulterated or shoddy article and is offering it to the public as genuine; suppose his daily language to his work-people is profane, and suppose his home is made a hell by the violence of his temper—should such a man be allowed to make use of the State boats and trains for the filling of his coffers? We think not, and we feel sure that Mr. Gillett will, on consideration, agree with us. Public carriers do not exist for the enrichment of such a man. He has no more right to the advantages of interstate commerce than a wild animal. We would seize his goods as soon as he shipped them, unload them at the first station, under the eye of a pious inspector, who should be sternly prohibited from accepting money for letting them pass, and should be appointed only after a civil-service examination. We should also apply to every express agent and driver, and even to engineers and firemen of locomotives, the penal provisions of the bill directed against those who have guilty

knowledge of the wickedness of the owner of the goods. We would fine them all $20,000 apiece, *and* (not *or*) imprison them for five years. The alternative of fine *or* imprisonment would be much too good for them, and there are few express agents who would feel a fine of $20,000.

One word more. We little thought we should ever see the day when the Legislature of our country would take Mr. Gillett's noble stand for the right. We might well say, Now let us depart in peace. But we will not say it until we make one other suggestion. Should this bill be put in operation and work successfully, why should it not be extended to the passenger traffic? Old cynics will laugh when we propose that the trains or boats of our country should be reserved for the righteous, but we shall not by that be deterred from making the suggestion. Why, then, should the passage of bad men from State to State be permitted? Why should persons who, knowing that men engaged every day of their lives in violating the laws of God and the laws of the State are about to make little trips into the adjoining States, fail to inform the proper authorities of the fact, be allowed to keep it secret, or even to grin over it? Why should our great State machinery of transportation be placed at the service of every rascal who chooses to buy a ticket at the station? Why is not every ticket-office also a moral bureau, and why does not every train which rolls through our smiling fields carry only the pure and good? Consider what an engine of righteousness our railroad system would then become, and how rapidly this confinement of the wicked to their domiciles and the wide diffusion of the good would change the moral aspect of our country! Mr. Gillett is building better than he knows. He is simply a pioneer in a new field. He is preparing to make the material progress of the world moral progress also, and make our greatest inventions the servants of loftier ethics.

CECIL RHODES, PIRATE.

The examination of the Right Hon. Cecil J. Rhodes by the Select Parliamentary Commission, which was brought to a close week before last, was extraordinary in many ways. It was extraordinary for the evidence brought to light; for the cool effrontery with which Rhodes avowed his own baseness; for the sympathy with him, as man and plotter, openly shown by the Prince of Wales and Secretary Chamberlain; for Rhodes's defiant assertion that he would again conspire against a friendly state, only next time he would see to it that his conspiracy turned out successfully; and for his calm expectation, in which the general public seems to share, that no punishment whatever will be visited upon his crimes, but that he will go back to South Africa a greater hero than ever.

The essential parts of the evidence given have been sent by cable to this country, but the significance of the whole can be taken in only by reading the verbatim report of Rhodes's examination. Before it began, the only evidence from him the world had had was his absolute denial, given through Sir Hercules Robinson, of all knowledge of the Jameson raid. Even after Rhodes's hurried trip to England last year, and his conference with Mr. Chamberlain, the latter declared in the Commons: "To the best of my knowledge and belief, everybody, Mr. Rhodes, the Chartered Company, the reform committee of Johannesburg, and the High Commissioner, were all equally ignorant of the intention or action of Dr. Jameson." But now Cecil Rhodes nonchalantly informs the committee that the raid was his own from beginning to end. He planned it, he financed it, he ordered it, he hoped for its success up to the last hour. After Jameson started, he refused to stop him, though he could have done so. When the High Commissioner prepared his proclamation declaring Jameson an outlaw, Rhodes persuaded him to hold it back for one day. In brief, Rhodes, as he now coolly confesses, was all along the real plotter, the real raider; Jameson his tool and victim.

Nor was the piratical raid a sudden burst of anger. It was deliberately organized for at least a year beforehand. The plot was extraordinarily complicated. The building of the railroad to Mafeking and the transfer of the strip of land along the Transvaal border from the Bechuanaland Protectorate to Cape Colony were parts of the scheme. Thus Rhodes made the Colonial Office his unwitting instrument. With similar audacity did he use the Chartered Company. No less than $300,000 of that company's funds was illegally drawn out to buy arms and equipment for the attack on the Transvaal; this sum, however, Mr. Rhodes afterwards repaid out of his own pocket. In fact, the whole movement was his in conception and execution. This he now confesses, or, rather, glories in. That he should have used his position as Prime Minister of the Cape and manager of the Chartered Company (he admits that he practically was "the company") to conspire against a friendly state, does not appear to him wrong. It was not diplomatic, it did not exactly square with all the niceties of international law (these things seem very amusing to him), but it never occured to him that he was doing anything but his duty as an Imperial Englishman. He would do the same thing again in similar circumstances; only, another time, he would make sure of success.

The infinite meanness to which this great-hearted expander of England so often stooped in the course of his plans to make his country great and glorious, was brought out again and again in his examination. His leaving poor Jameson to bear the ignominy and to stand trial, without a word, was a piece of baseness almost unparalleled. He now justifies it by saying that too many people and too large interests were involved for him to be able to speak without imprudence. Then there was that famous letter of the women and children of Johannesburg praying Jameson to come to their rescue. It was this which made the Poet Laureate dithyrambic. It was this which was set up as the only cause and sufficient excuse for the knight-errantry of the raiders. But what are the facts about the letter, as shown on the examination? Why, it was a cooked-up letter to start with, had been in Jameson's pocket for a month and ten days, and was then cabled to England by Cecil Rhodes himself, with a forged date. Sir Hercules Robinson was almost as shamefully used by Rhodes as was Jameson himself, and the Johannesburgers were deceived by him cruelly. All told, this magnificent and swelling Imperialist appears to have played a consistent rôle of petty trickery and betrayal, of deceit and corruption, all through, and to have mixed up personal and pecuniary ends with his plans of conquest most unblushingly.

Cecil Rhodes is, in truth, the perfect type and flowering of a form of statesmanship and so-called patriotism which is too common in our day and met with in too many lands. He is nothing but a pirate in a high hat and patent-leather shoes. Laws and treaties are but jests to him. Anything he covets—be it another's land, mines, or country—is fairly his if he can get it. Rhodes wanted to "take" the Transvaal because he "needs" it. Right and justice, honor and humanity, are things to smile at. These are the sentiments, this the huge imposture, behind the clamor in so many countries for territorial expansion, of empire and colonies and islands, simply for expansion's sake. It is something to have the great exponent of these doctrines of selfishness and lawlessness stripped of his romance, and shown to be the cruel, treacherous, reckless adventurer he is. But his counterpart exists in nearly every powerful nation of the modern world, and, whether known as Jingo, Federationist, Annexationist, or plain filibuster and pirate, is to be fought by all those who place good faith and law above lands and mines and guano beds and sugar plantations, and plenty of ships and offices, and enough for everybody and something left over.

PROF. DICEY ON COMMON CITIZENSHIP FOR AMERICA AND ENGLAND.

London, February 28, 1897.

On Friday last, February 26, in a public lecture delivered at All Souls College by Prof. Dicey, the Vinerian Professor of English Law, "A Proposal for the Common Citizenship of both branches of the English People" was developed and defended before a large and representative gathering of members of Oxford University. After deprecating the off-

hand condemnation of any such proposal as an absurdity, Prof. Dicey surveyed briefly certain noteworthy signs of a widespread desire to recognize the unity and to extend the power of the whole English-speaking race. The sentiment of the unity of the English people was, he said, beginning to take a more concrete and profitable form than questionable declarations as to the superiority and ultimately certain predominance of the Anglo Saxon race. Apart from the stimulation in England of a friendly interest in the well being of English colonies, there had been on both sides of the Atlantic a unanimity, startling to politicians, in condemning war between the United States and England. Arbitration had already decided questions which, a century ago, would have led to war. A permanent tribunal for the decision of disputes between two kindred nations was ultimately sure of establishment, whatever might be the momentary outcome of actual negotiations. Without believing that arbitration could dispose of all international disputes, we might reasonably maintain that the greater number of questions likely to arise between England and the United States could be referred to a law court, by disputants who entertain similar ideas of law and of legal procedure.

Though much current talk of Anglo-Saxon greatness be foolish, though many schemes of unity be Utopian, yet popular catchwords and Utopias are signs of the trend of opinion, and these in question indicate a prevalent sense of national unity which condemns and reprobates as civil war an appeal to the arbitrament of arms by the different branches of the English people. The lecturer's proposal was, he said, an attempt to give practical effect to the widespread and growing belief in the unity of English-speaking peoples. It was that England and the United States should, by concurrent legislation, institute a common citizenship for Englishmen and Americans; that an act of the Imperial Parliament should make every citizen of the United States, during the continuance of peace between England and America, a British subject, and that an act of Congress should make every British subject, during the continuance of peace between America and England, a citizen of the United States. Technically he argued that such acts would suffice; but practically a treaty providing for the passing of such acts would no doubt be necessary. There was no need to dwell on qualifications and limitations in detail, which would certainly be introduced into such acts. After hinting at some of these details, Prof. Dicey insisted that his proposal was not designed to effect anything in the least resembling political unity. His plan simply aimed at making each citizen of the one country also a citizen of the other. Every American citizen, on landing at Liverpool, would, under his proposal, be in the same position as to civil and political rights occupied by an inhabitant of Victoria who might have landed from the same boat at the same time; and an Englishman stepping for the first time on American soil would stand, as to his civil and political rights, in the position of an American citizen who, having been born abroad, had for the first time landed in the United States.

This proposal the lecturer proceeded to defend as (1) a feasible one, (2) one of comparatively small practical effect, but wholly good, so far as it went, (3) greatly beneficial in its indirect and moral effects. It was practicable, because it required no revolutionary change in the Constitution of either country to found a common citizenship for both. Two short acts—one by Congress and the other by Parliament—would accomplish it. The assertion of its practicability rested, of course, on the assumed desire for it on both sides. If the wish were prevalent among a majority in England and America, no substantial difficulty would stand in the way of giving effect to it, because the common law of both countries is the same, making the acquisition of nationality depend, generally speaking, on the place of a person's birth. To the objection that no such wish has yet arisen, the lecturer replied by saying that neither men nor nations desired an end until it was set before them as an object for attainment. And then he added: "I shall have done enough if I have proposed an object which by degrees the best citizens both of England and of America may come to desire, and have shown that, if they wish for it, it is easily attainable."

Perhaps the most striking points in Prof. Dicey's argument were those next given to show that the practical effects of a common citizenship such as he had in mind would be small, revolutionary though the proposal might sound. He began by accentuating the fact that, under his proposal, America and England would in no sense become one country, and would not be entering into partnership or alliance as regards other Powers. As matters now stand in England, and for that matter throughout the British Empire, aliens belonging to a country at peace with England enjoy nearly all the civil rights of British subjects. They can trade in England, are protected by British law, can own land, and cannot, except by a special act, be expelled from England. An alien cannot own a British ship, though he may hold shares in a company which owns ships. An American in England would hardly feel that he had gained a perceptible increase in his civil rights under the proposed common citizenship. In some English colonies this might be somewhat different. On the other hand, the position of aliens in the United States, he said, was, theoretically at least, inferior to their position in the United Kingdom. Common law and the varying laws of the several States governed their right to hold and to inherit real estate, but State legislation had on the whole tended to improve their position. Englishmen in America would thus gain rather greater civil advantages than Americans in England by an interchange of citizenship, but in neither case would the ordinary transactions of life, outside the sphere of politics, be substantially affected. An Englishman in New York undoubtedly feels that he has pretty much the same rights as a citizen.

Not civil, but political, rights would be affected. The political status of the American in England would become precisely that of his grandfather, who before 1776 was a citizen, say of New York or of Massachusetts, but also a subject of the British crown. He would be able to vote for a member of Parliament, to sit in Parliament, and, if fortune favored, to become a Cabinet minister or Premier. He might aspire to the House of Lords, just as a British subject might, under the proposal, aspire to a seat in the Senate. On the other hand, he would be liable to be tried in England for a limited number of criminal offences though committed in the United States, but the common law doctrine that crime is territorial could and would set a strict limit here. The whole question of treason and of political offences would have to be carefully and specially considered with other details easily adjustable, supposing the existence in both countries of a desire for common citizenship. If every American now in England or any of her colonies were, by act of Parliament, made a British subject, he might be long in realizing any change. Suppose we could say that every American in England would, by act of Parliament, become a British subject after the 1st of January, 1901, it would be startling, but surely not alarming. Americans would enter Parliament, but we do not regret the presence there of men who by race, language, and religion are much less closely connected with us. We need not, said Prof. Dicey, be startled at the thought of seeing a citizen of New York, or of Massachusetts, seated at Westminster by the side of a Parsee or a Bengalee. Our liberal laws of naturalization make it impossible to maintain that political life is to be open only to natural-born British subjects. Here, with an unmistakable reference to the recent candidature of Mr. Sinclair (Schlesinger), who was naturalized while standing for Parliament and denouncing aliens, Prof. Dicey said, "Without yielding to any insular prejudice, it is allowable to confess that one would as soon have seen seated in Parliament . . . any of the eminent citizens who have been accredited to the Crown as ministers of the United States, as a gentleman whose zeal for British honor is undoubted, but who sits in Parliament in virtue of a certificate of naturalization on which the ink was scarcely dry on the day of his election."

The direct effects of common citizenship, he continued, might be less for an Englishman in America than for an American in England. Many rights and liabilities in America connected themselves with State citizenship rather than with being a citizen of the United States. An Englishman's civil rights would scarcely, if at all, be altered. He would gain the political rights of voting for a member of Congress, of sitting in Congress or in the Cabinet; he could not aspire to the Presidency. The naturalization laws in America appear, on the face of them, a greater safeguard for the standard of citizenship than the English, and might seem to constitute an argument, from the American point of view, against the present proposal. But the lecturer maintained that they were by no means evenly enforced, and, therefore, largely served to bring newly arrived emigrants of weak character into the undesirable companionship of political managers. The aliens whom these laws chiefly excluded were the very class of foreigners who most deserved to become citizens. This opinion he echoed from the lips of an American of some eminence, who maintained years ago that the abolition of all checks on naturalization would, as things stood when he spoke, be a benefit. Accordingly he argued that restrictions on naturalization which are, in the opinion of Americans themselves, of dubious value, were not worth weighing against any serious advantages to be obtained from the common citizenship of the English-speaking peoples.

Turning now to his third point, that the proposed common citizenship would be greatly beneficial in its indirect and moral effects, Prof. Dicey urged that community of race, of religious and moral beliefs, and of political ideals connected Englishmen and Americans with links which it was impossible to break. Their material interests did not clash. The openly proclaimed fact that neither division of the race could be induced to attack the other by any provocation falling short of the

causes justifying civil war, would increase the material power both of England and of America. And this fact would be made plain by a scheme of common citizenship, as by an Arbitration Treaty. The lecturer now spoke of what individuals in England or America could contribute to the welfare of English-speaking peoples under a scheme of common citizenship.

"Let me take one example," said he, "known to most of us. Whether Mr. Godkin is at this moment a British subject or an American citizen, I am totally ignorant; what I am certain of is, that the writer who, landing, I believe, in America as technically a foreigner, has by talent, energy, and, above all, character, done more than any one man to raise the character of American politics, would, should he ever return to the United Kingdom, be able to give us invaluable aid in the solution of some of the most difficult questions which demand the consideration of English statesmanship. Whoever will read the 'Problems of Democracy' will assuredly admit that its author might in many respects supply in England the place left vacant in the world of speculative politics by the death of Mill and of Maine."

He then spoke of the late Mr. Benjamin as one who, "unless common rumor was mistaken," came near obtaining a seat on the bench, after achieving the very highest eminence at the bar.

An intimate link uniting America and England (including her colonies and dependencies) was the prevalence of English common law. Upon this theme the Professor was most eloquent, and cited with equal admiration the work done by Judge Holmes and by Sir Frederick Pollock and Prof. Maitland, finally dwelling upon the non-political nature of his proposal for common citizenship, and upon the appropriateness of such a non-partisan theme for an Oxford Professor of English Law. After an interesting survey of the possibilities for good latent in the Monroe Doctrine, and a further development of the moral and material advantages indirectly to be compassed through establishing a common citizenship, the lecturer argued that the present time was especially propitious for entertaining and discussing such a proposal.

Having reference to the ticklish question of ratification by the Senate of the Arbitration Treaty, he distinguished between the moment which was accidentally unpropitious and the time which was essentially propitious. The fact of common ties between the English-speaking peoples was in men's thoughts, and a recognition of it might naturally issue in the desire that states closely connected by race, by community of history, or by historical sympathies, should also communicate to each other the rights of citizenship. The notion of a similar union in citizenship of the Latin races should not offend English patriotism. Here followed a lucid and remarkable account of common citizenship in the German fatherland, and of the part which it had played in building up the German power. The present time was propitious for drawing closer ties between England and America because, both countries being strong, it could not be alleged that either is seeking aid or protection. The fancied antagonism between a republic and a constitutional monarchy had vanished. Slavery and the visible imminence of the "irrepressible conflict" had disappeared. The memories of the contest between England and her colonies had passed away. We all knew that George the Third and his supporters were not consciously bent on tyranny, but acted under a conviction that the independence of the colonies involved the ruin of England. Prof. Dicey declared that the national independence of the United States was a benefit to mankind, because it was well that the English people should have developed the English form of republicanism, and said that what he was now advocating was an attempt to preserve the good, while undoing all the evil, which flowed from the contest with the colonies. The lecturer now paid a feeling tribute to the peace-making and reconciling effects of the action of Queen Victoria and her adviser, who made it possible for Lincoln to steer through the *Trent* affair without a war, arguing that her reign was therefore a peculiarly propitious one for close union. He then gave a really powerful picture of the greatness of Lincoln, whose civilian guidance of the American war he strikingly paralleled by the career of Lord Canning in India during the Mutiny. Finally, his discourse ended with the cordial words used by King George in welcoming Mr. Adams as Minister of the United States of America to the court of St. James's.

LOUIS DYER.

THE MOTIVE OF GREEK INTERVENTION.

ROME, February 24, 1897.

THE startling turn which the Cretan affair has taken in the shelling of the Greco-Cretan forces at Canea has reached you in all its details long ere this, but the part of the history which the telegrams cannot tell is indispensable to the understanding of it. The intervention of Greece, after it had become known that the Powers had decided to put an end to the disorders in Crete by compulsory modifications in the government of the island, was not merely useless, but disastrous, and the object of it was, not to secure the independence of Crete, but, on the contrary, to prevent the independence by making the annexation of the island to Greece a foregone conclusion. If Greece had desired to associate herself with the Powers in their effort to reform the Greek provinces of Turkey, in the simple and modest manner befitting the position of a tiny state which owes its existence, and every foot of ground over which its rule is extended, to the protection and sympathy of the great Powers, the way would have been to send a torpedo-boat with six marines to represent the Greek flag in the transaction. This could have done no harm, and would at least have conciliated the Powers. The audacious debarkation of a body of regular Greek troops when the Powers had already taken their positions on the question, was a distinct defiance of Europe, and a declaration on the part of Greece that she intended to contest the right of the great Powers to regulate the Eastern question.

Greece has never shown that she cared for the freedom of Crete, but, on the contrary, that she regarded the island as a means for the aggrandizement of the Hellenic kingdom. In the great insurrection of 1866-9, which many of your readers will remember, the Cretans, after three years of suffering and devastation such as the late history of the Turkish empire does not show the record of elsewhere, had finally worn out the repressive power of the Sultan, his finances and his military resources, and A'ali Pasha, the Grand Vizier, came to Crete to make an effort to conciliate the islanders. He brought these concessions: complete autonomy for the islanders, with the choice of a prince to be appointed for life and of their own unrestricted selection; a legislature of their election; exemption for five years from taxation, with minor privileges. The Cretans, under the advice of Gen. Ignatieff and the Greek committees, refused the concessions and held out for complete independence. A'ali Pasha, with whom I had full and most satisfactory explanations of the concessions to be granted, and who was most reasonable in his attitude towards the Cretans, was obliged to retire without having gained a point. Within three months the Greek Government sent over to the island a band of volunteers, under the command of an old brigand, Petropoulaki, who paraded the streets of Athens with ostentation, insulted the Turkish minister and provoked Turkey to a rupture of relations, openly embarked for Crete, and, on arrival, took command of the insurrectionary forces, and then, without firing a shot, surrendered the island to the Turkish authorities, and so put an end to the insurrection; not even an amnesty being secured for the exiled chiefs of the Cretans.

This infamous treason was deliberately committed by the Greek Prime Minister, Bulgaris, after full understanding with the Turkish diplomatic representative, the rupture being a part of the farce. The real motive was that, as the Powers would not consent to the annexation to Greece, it was considered good statesmanship to keep Crete in servitude as material for another and perhaps more complicated movement in the Turkish dominions. That the Russian Government was an accomplice in this crime does not relieve the King of Greece and the Ministry of Bulgaris from the charge of treachery to the Cretans. The King had, at the instigation of Russia, dismissed the Comoundouros Ministry and summoned Bulgaris, who was more pliant to the Russian scheme, to form a ministry which would consent to stop the insurrection; and the result was, that the Cretans, who had conquered the sympathies of Europe and practically their freedom, were ordered back to their old servitude for twenty-five years more, to suit the plans of Russia and the Russian party in Greece, and because the Powers then, as now, declined to give Crete to Greece. And now, as then, Greece prefers to defy the Powers which are the real friends of Greece, and plunge Crete into another internecine war, to prevent the liberation of Crete in any other form than that of annexation to Greece.

The motive, I repeat, is not the love of Cretan liberty, but the aggrandizement of Greece, and the Powers have taught the Greeks a lesson which has been rehearsed on other occasions with less severity, but which the Greeks would have learned before if they had been the intelligent people they have been supposed to be. In 1886, the present Prime Minister being then in power, the same game was tried for an extension on the northern frontier. The troops were sent to the frontier and fighting was actually carried on for several days between bands of volunteers armed by the Greek Ministry and supported by the regular troops, and hostilities were carried on against the Turkish outposts, without any declaration of war, but with magniloquent proclamations and threats against Turkey if the Powers did not give Greece some more territory. The result was the blockade of the Peiræus, which closed the agitation and permitted the Ministry to resign, with a flaming appeal to the nation, saying what it would have done if the Powers had not stopped it; the fact being that the Turkish general had his orders to cross the frontier if the provocation lasted another day, and march on Athens, which he would have done with no serious difficulty, since the

Greek army lacked organization and even the shadow of discipline. Tricoupi came to power just in time to save Greece from a disaster, but, as the ranters of Athens said, only to prevent Greece from going to Constantinople. The Turks would have been in Athens in less than two weeks, there being on the frontier 40,000 men, many of whom were veterans of the Bulgarian war.

This time the Powers were agreed; for the danger to the peace of Europe, if Greece was permitted to play fast and loose with the elements of discord, was too great to be trifled with. Too great indulgence was shown to Greece, for the first attempt to send troops to Crete, after the Powers had decided to take the affairs of the island in hand, should have been stopped at the Peiræus; but, after the order to withdraw had been given in the name of the six treaty Powers, to have permitted so gross a violation of international law to be continued by Greece would have been to make Europe ridiculous and impotent, to have become the accomplice of Greece in the official filibustering, without even the form of a declaration of war on Turkey, and to let loose the elements of insurrection all over the empire. The success of Greece in seizing Crete would have been the signal for the general grab and the general mêlée which is exactly what the Powers are doing their best to prevent.

The Italian Government has joined the European concert with the conviction that it was the only course which would avoid a general war, and, with all the liberal Powers, has done so with the expressed determination to prevent Turkey from misgoverning the island any longer. It has declared that a real autonomy must be given to Crete, and that no Turkish pasha, under any denomination or cover, shall exercise any power, and that this autonomy shall be protected from intrigues from Athens as well as from Constantinople. The reasons for this absolute separation from Greece are various. In the first place, Crete cannot be governed from Athens, where the pressure of impecunious lawyers in hunt for places is too strong, and the Government too weak, to permit the island to be left at the command of a Government which is unable to maintain order at home. Then, the institutions in which all the turbulent Cretan chieftains have been bred are too widely different from those of the spurious and abortive Latin forms of government in Greece to permit the reconciliation of the system and the men, with the authority of which the Greek monarchy can dispose. The island feuds are savage and bloody, and the authority which can restrain them is not to be found in Athens, where there is not at the present moment a single statesman of even the third order; and with a weak control the local and religious antipathies would break out in worse disorders than ever were known under the Turks. In one of my last visits to Crete, in the régime of Photiades Pasha, a Christian (so-called) governor, with a Cretan diet and a police of Cretans of both religions in proportion to the population of both, there had been, the Governor informed me, 600 assassinations due to local feuds and intrigues, political and growing out of the elections, or out of village quarrels, mainly between men of the same religion, with a destruction of property in malice such as no insurrection had ever developed. Twenty thousand olive-trees had been cut down to injure the interests of opponents, and the gendarmerie, being local, either made no effort to restrain the disturbers of the peace, or took sides in the feuds. Even while I was there, came in every day reports of the ruin of proprietor after proprietor by the destruction of the olive orchards, which are the chief riches of the island.

To stop all this, the Governor must be a man whose authority cannot be attacked by intrigues at Athens, and he must have behind him the force of an international sanction, with a police which will not be the instrument of local quarrels. If, when order has been firmly established, the islanders (contrary to my conviction) should desire annexation to Greece, and the rights of the large minority of the Mussulmans can be conciliated, they must be allowed to have their own way, but not as the result of the Greek defiance of Europe and violation of the common usages of a civilized Power. Greece is an independent Power, though not an inch of territory has ever been won by Greek effort, and though her government has been one of the worst failures of European constitutionalism. If she declares war on Turkey she has only exercised a right, but to invade a possession of Turkey without the pretence of a formality or necessity, and especially when the Powers do not leave Turkey the power of reinforcing her army or retaliating by the invasion of Greece, cannot be permitted while there is the faintest pretext of international law, since Greece is the absolute creature of that law. Public opinion is strongly averse to the application of force to the filibustering army, in Italy as in England, but the lesson is a necessary one, and no one who cares for the chance of keeping the peace more than for the particular increment of Greece will do more than regret the necessity of the lesson. W. J. S.

MME. DE CHASTENAY.—III.

PARIS, February 25, 1897.

THERE has been a long interruption in publication between the first volume of the interesting memoirs of Mme. de Chastenay and the second. The first volume took us through the dramatic times of the Revolution and the troubled period of the Directory. In the second volume we find ourselves in the Empire: Napoleon has crowned himself, he has created the Legion of Honor, he has formed a household. Réal, who, we recall, was the benefactor and the most intimate friend of Mme. de Chastenay, "could not," she says, "show himself to us at first without blushing" with the new insignia of the Legion of Honor. "I found Garat at Fouché's [another friend of Mme. de Chastenay] with his coat tightly buttoned so that one could not perceive on the breast of a philosopher the sign of the vanity of a courtier; the cruel Fouché forced Garat to show it to me. In a few days, people accustomed themselves to it; after a few months, they began to envy it."

Already, as First Consul, Bonaparte had re-established some of the functions of a royal household; as Emperor, he created chamberlains and *dames du palais*. Fouché thought of Mme. de Chastenay for one of these places. She refused at first to entertain the idea; but, at the instance of her mother, she changed her mind. "I returned," she says, "to see Fouché, and told him I had changed my ideas; he spoke to the Emperor, who approved of his advice, and even spoke to him of the conversation with me which seemed to have struck him so much [the conversation at Châtillon in the month of May, 1795]; he spoke, as he did afterwards in several circumstances, of the *esprit* which he was good enough to attribute to me." Mme. de Chastenay had to make a visit to the Empress, in the palace of Saint Cloud.

"She came to me and told me that she had heard from the Prefect of Police that I had consented to accept a place as maid of honor; the Emperor was going away the next day, but I should be appointed on his return. The words gratitude and Majesty came with some difficulty from my lips. What I felt cannot be expressed, and, if I had seen a door open, I think I should have run away. I was going to be the follower of Mme. Bonaparte, of the wife of a man whose actions and character I had held in detestation for three years!"

The Emperor came back, and Mme. de Chastenay again saw the Empress. She was well received, but no further mention was made of the offer and of the half-promise which had been made to her. She had probably been represented by some as too closely allied with the Legitimists, who saw in Napoleon only the usurper, the murderer of the Duke d'Enghien; by others as too intimate with Réal, with Fouché, with the men of the Directory. "The fear of the influence which it was thought I should like to have, because I was imagined to be capable of using it, served as a pretext to put aside a woman who was represented to the Emperor as one of those *femmes d'esprit* whom he always feared, while incessantly annoyed by the insipidity of the others."

It is not to be wondered at if Mme. de Chastenay is slightly ironical in her description of the festivities at the coronation of Napoleon and Josephine.

"The great ceremony took place. I was not present, but I heard that the new Emperor, by assuming without dignity the airs of a conqueror, revolted those who were not won over to the new régime. It is remarkable that, at that time, the greatest opposition was manifested not by the partisans of the monarchy, but by the former friends of liberty. . . . Marshal Lefebvre bore on a cushion the sword of the general who had become an Emperor. The Marshal, during the whole ceremony, boasted vainglorioously of having been grenadier in the Guards when Louis XVI. was consecrated, of having been in the church at Reims and marched with the procession. I really believe that this reminiscence flattered his pride more than his function at the moment."

In the fifth chapter of this second volume, Mme. de Chastenay draws a portrait of Fouché which will be found interesting:

"Fouché was rather tall, thin, pale. In his youth his hair must have been blond. His eyes, very small, very close together, very red, were nevertheless very piercing, and his whole face was not wanting in 'physiognomy' and, when occasion required it, in a certain nobility. He spoke with ease; . . . very natural, with an air of depth, possessing some gayety and sometimes gleaming with intelligence, when he put on with seriousness an air of superiority to all men, all ranks, all opinions, all passions, and made you believe that he moved everything according to his calculations without being moved himself."

Fouché was accustomed to high offices, "to the ministry as a mode of life"; was fond of money and had succeeded in making a great fortune.

"Except on the days of a great and splendid display, his happiness consisted in living like a bourgeois who enjoys perhaps ten or twelve thousand francs income. His wife, who was passionately fond of him, and as jealous as if he were twenty years old, preferred this life of retreat. An aged relative of his wife, his secretary, who was an old Oratorian like himself, the governess of his daughter (a woman of *esprit*), his sons' tutor, some old Oratorians or subalterns—such was his only society, which amused itself the whole evening with the game

of Boston; . . . such was during ten years of ministry the life of the man who frightened Europe and kept France under."

Mme. de Chastenay adds that, with all his talents, there was much of the charlatan in him. Minister of Police after the 18th Brumaire, he retained in his hands the fate of the émigrés; he rendered services to many, and had their names struck from the terrible list; his object was to secure creatures in all parties. He succeeded in becoming intimate with Mme. de Vaudémont, a Princess of Lorraine. He continued, however, to be in relation with the Jacobins; he knew how flexible they were, he employed them in many ways—in secret missions, as journalists; he paid handsomely for the verses of the renegades who sang the praises of the Emperor. He kept a large staff of spies, and he had spies in all ranks of society. Bonaparte never liked him, but always had need of him; he needed him on the 18th Brumaire, and at once made him minister; he never completely confided in him, but was afraid of him, knowing him to be capable of anything to avenge himself.

Mme. de Chastenay describes the salon of Talleyrand with much care. She often went to his house, though the society there was not literary.

"People arrived at 11 o'clock, if they had not dined there. At midnight a sort of supper was served; it was generally at that moment that the Prince of Benevento arrived. After the supper and some moments of conversation, whist was played, and those who did not play could retire. The ordinary whist-players, the old friends, the constant lady friends of Talleyrand, were commonly there. Mme. de Laval and the Duchess de Luynes, when she came to Paris, were among the old friends. The sister of Prince Poniatowski and the Duchess of Courland, who assumed the air of a sovereign, rejuvenated themselves, and were rival objects of devotion and admiration."

Champagny, Duke of Cadore, who became Minister of Foreign Affairs after Talleyrand left the Ministry, had also a salon, of which Mme. de Chastenay became a very assiduous frequenter. She saw the Empress Josephine at the Tuileries and at Malmaison, and has notes on her *soirées intimes*, on her ladies, on the members of the Bonaparte family whom she met there.

Fouché was very ardent in promoting the divorce of Napoleon from Josephine; he fell, however, soon afterwards into disgrace, without any apparent reason. He was replaced in the Ministry by Savary, Duke of Rovigo. "There was general apprehension, I must say. It is impossible to imagine to what a degree Fouché had convinced the public mind of his marvellous capacity, of his immense superiority, of his philosophy of mind, of his aversion to vexatious measures, of his predilections in favor of the higher classes, of his secret aversion to the old Jacobins, from whom he had everything to fear." It seemed to Mme. de Chastenay as if the Minister's reason was the necessary counterpoise of the despotism of the sovereign. Fouché's successor was in her opinion incapable, and had only "the blind devotion of a Mameluke." The precise reason of Fouché's disgrace is not yet known. Did the new Empress object to having relations with a former regicide? It seems certain that Napoleon found it difficult to make Marie Louise play cards at the same table with Cambacérès and the Duke of Otranto. Fouché was appointed Governor of the Roman States. "I am Pope," he said to Mme. de Chastenay. "All roads lead to Rome," said his friends. Before his departure Napoleon asked him to give him back all his letters; Fouché replied that he had burned them. Seals were put on his papers, but the letters were not found when the seals were broken. After a short stay in Rome, Fouché obtained permission to retire to Aix; he remained there, in his *sénatorerie*, for some time, almost forgotten.

Mme. de Chastenay was living quietly in the country, with her family, when she received an order to appear in Paris before the Prefect of Police. Some papers bearing her name had been found among Fouché's. She made the journey to Paris, first saw Réal, her friend and adviser, and afterwards Savary, who reassured her, and even asked her to come to Mme. de Rovigo's soirées. "Perhaps," she says, "if this page ever finds readers, people will be surprised at the fear which seized us; but exile, at that time, could be pronounced on a caprice, on a slight suspicion, and exile offered seldom any chance of return." On her return to Paris, Mme. de Chastenay paid visits to Mme. de Rovigo, who was of a good family. Savary, too, thought himself "born," and liked to say "nous autres," in speaking of people of quality. "I must repeat," says Mme. de Chastenay, "that in all such houses the old society was dominant and was generally immixed only with people holding high offices." It was at Mme. de Rovigo's that Mme. de Chastenay made the acquaintance of the Maréchale Lefebvre, whom Sardou has made famous under the name of *Mme. Sans-gêne*. It was this woman who said to her maid, "C'est moi qui se coiffe." When Napoleon made Marshal Lefebvre Duke of Dantzic, and when a deputation of the Senate went out of compliment to the Maréchale, the porter said to them, "You may go, you may go. Madame cares little for your *bêtises*. Madame is now looking after her hay."

The Emperor was then at the height of his glory. The kings, many of whom had been crowned by his hand, came in person to Paris to bask in the rays of his greatness. Fouché once said to Napoleon, "If I were you, my dynasty would soon be the oldest in Europe," and it really seemed as if the Emperor could dispose of all thrones.

"The King of Bavaria," says Mme. de Chastenay, "and the Queen of Bavaria, who, it was said, believed that she had some claim to the love of the unfortunate Duke d'Enghien, both came to Paris. The daughter of this King was the wife of Eugène; his niece was the Princess of Neuchâtel (Mme. Berthier). I remember that the new Princess of Hohenzollern was a niece of Murat and did not even bear her name. Mme. de Coislin asked the Princess Pia of Bavaria (born D'Arenberg) how she got on with this Princess of Hohenzollern, of such extraordinary creation. 'Very well, Aunt,' said the young woman; 'I assure you she is not proud at all.'"

Correspondence.

READERS FOR THE AMERICAN DIALECT SOCIETY.

To the Editor of The Nation:

Sir: At a recent meeting of the American Dialect Society a committee was appointed to supervise the reading of American books, for the purpose of collecting all words and uses of words not yet recorded in the dictionaries. This is part of the larger work of the Society in gathering all dialectal material which represents spoken and written usage in America. Such material will be eventually incorporated, it is hoped, in a compendious American Dialect Dictionary, similar to the English Dialect Dictionary now in course of publication.

The reading of American books for this purpose has already begun, but the committee desires to secure more volunteers for this great and important undertaking. The books to be read include especially all dialect novels, as well as dialect stories and sketches in magazines or special volumes. Besides, American books of all sorts, particularly books of early date, may furnish valuable material. Any one who wishes to assist in the reading is invited to address the chairman of the committee, stating the book or books he wishes to undertake, or asking for assignment of reading. Such volunteers will receive a circular of directions, describing a simple and uniform plan of collecting and reporting dialect words.

The committee hopes to secure the coöperation of teachers of English or other languages in colleges and schools, of clergymen, and of people of leisure who are interested in observing peculiarities in language. The assistance of all such, as well as of any others who are willing to undertake the reading, is earnestly solicited.

To most readers of this circular the importance of such an enterprise need not be urged. The undertaking should appeal to all Americans, as contributing to settle the relations of English in Britain and America, and as showing the growth and development of the language upon American soil. Besides, the dictionary which will doubtless grow out of the work of the Dialect Society will be a reliable compendium of American usage, useful not only to this, but to coming generations.

The committee consists of Prof. Benj. I. Wheeler of Cornell University, Mr. E. H. Babbitt of Columbia, and the chairman, whose name appears below.—Very truly yours,

O. F. Emerson.

Western Reserve University, Cleveland, Ohio.

COCKAYNE'S LEXICON.

To the Editor of The Nation:

Sir: This library has just come into possession of a nearly complete copy of the 'English-Greek Lexicon' compiled by Thomas Cockayne and published in 1661. The 'Dictionary of National Biography,' *s. v.* Cockayne, Thomas, says "no copy [of this book] is in the British Museum," so that it may be supposed to be quite rare. I should like to learn whether any one in this country has a copy from which we might get a collation, with a view to ascertaining how nearly complete our copy is.—Very truly yours,

W. I. Fletcher.

Amherst College Library, March 10, 1897.

SLAVIC STUDIES IN AMERICA.

To the Editor of the Nation:

Sir: As undoubtedly many readers of the *Nation* will turn with deep interest to Dr. Leo Wiener's report on "The Slavic Languages" in the current issue of the *Harvard Graduates' Magazine*, I take the liberty of calling attention to an unfortunate oversight or misstatement in the closing paragraph. Dr. Wiener, after speaking of the services rendered to Slav studies by the French, Germans, and Swedes, says: "The English can speak with pride of Ralston; America has only Miss
